ZMC fractures involve force directed posteriorly over the malar eminence or zygomatic arch. They were formerly referred to as "tripod" fractures, but this term is not entirely accurate, because this bone articulates in five places, even though two of the five generally do not require fixation during reduction. The characteristic facial deformity of a displaced ZMC fracture is flattening of the malar eminence, with or without apparent enophthalmos, and difficulty opening the mouth completely.

The remaining fractures involving the orbit (fractures of an orbital wall without associated rim fracture) are referred to as blowout fractures. Smith and Regan first described them in 1957 after observing a patient who had been hit in the periorbital area by a hurling ball.

- Size of fracture
  - If this is small and/or minimally displaced, surgery may not be indicated.
  - If there is a linear wall fracture, there is a risk of entrapment of an extraocular muscle or periorbita.[3]

Indications

- The first four types of fractures are covered in Chapter 122.
- Entrapped extraocular muscle mandates immediate open reduction internal fixation.
- Large (>2 cm^2) or displaced fractures should be offered repair to treat/prevent enophthalmos, NOT to prevent diplopia (which will almost always resolve on its own).

It is generally accepted that fractures involving more than 50% of the orbital floor are likely to cause later enophthalmos. Displaced fractures

with an area of 2 cm^2 or greater are most significant: Approximately 1 cm^2 produces about 1 mm of enophthalmos, and at a 2 mm or greater difference in projection of the globes, an aesthetic defect is noticed. The area of the medial wall fracture must be accounted for when making this rough calculation; although the medial wall is repaired less frequently, it contributes to later enophthalmos.[4] A recent series of fractures of the orbital floor found that pediatric patients with large fractures who underwent surgery were much less likely to develop enophthalmos than their conservatively managed counterparts but that some children who presented with initial enophthalmos resolved over the following 6 months.[5] In the pediatric population, it is acceptable to defer surgery except in patients with acute enophthalmos, muscle entrapment, or vertical dystopia.[6]

Contraindications

- Systemic comorbidity
- Hyphema or traumatic optic neuropathy
  - Wait at least 5 days for hyphema to clear to prevent rebleeding.
  - Wait up to 6 months for traumatic optic neuropathy, which often improves on its own.[7]
- Frank infection in periorbital area or sinus

Preoperative Preparation

- CT scan available
- Decide what implant material to use and how/whether to fixate.

Operative Period

Anesthesia

- General anesthesia by endotracheal (GETA) or laryngeal mask airway (LMA)

Positioning

- Patient supine
- Vertex at top of bed
- IV steroid bolus (8 to 12 mg dexamethasone in adult)

Perioperative Antibiotic Prophylaxis

- Cephalexin 1 g within 1 hour of incision in uncomplicated cases
- Repeat q 8 hours for total of three doses
- In situations involving a foreign body, consider adding anaerobic coverage or using clindamycin.

Monitoring

- As per anesthesia

Instruments and Equipment to Have Available

- Implant material
- Fixation system with drill if needed
- Suction (8 Fr works well)
- Needle-tipped bovie (low power)
- Des Marres vein retractors
- Corneal protective lens lubricated with ophthalmic ointment
- Toothed forceps
- Periosteal elevator (we prefer a Cottle-type)
- Ribbon retractors
- Long bipolar

- Flexible drain
- Nylon traction suture (5.0) and Steri-Strips

Key Anatomic Landmarks

- Incision is made postseptal while retracting the lid anteriorly over the rim and retracting the orbital contents with a ribbon retractor
- Isolation of the fracture site is not complete until the posterior medial ledge is cleared to allow the implant to rest on this (for floor fracture) or good support is maintained both superior and inferior (in medial wall fracture, where a small posterior portion may be left unrepaired to avoid any manipulation of the optic nerve).
- Blowout fractures usually occur medial to the infraorbital canal but sometimes lateral, and the nerve should be identified and preserved.
- The optic canal may be as anterior as 38 mm from the anterior lacrimal crest in adults and is found in the posterosuperior medial wall. The posterior ethmoid artery is between 5 and 8 mm anterior to this.
- The anterior and posterior ethmoid arteries are found at the level of the frontoethmoidal suture and should be controlled with bipolar electrocautery or clipped and divided.
- The inferior oblique muscle originates just lateral to the anterior lacrimal crest. Take care to divide the periosteum anterior to it and then elevate it with the remainder of the orbital contents. There is no need to repair this later.

Prerequisite Skills

- Basic macroscopic soft tissue and bone handling techniques
- Familiarity with implants and plating system

Operative Risks

- Blindness from trauma to optic nerve or postoperative hemorrhage

- Diplopia (which is usually short-lived)
- V2 numbness
- Infection
- Malposition of the lower lid
- Damage to the globe

Surgical Technique

- Perform forced ductions.
- Place a protective contact lens lubricated with ointment.
- Retract the lower lid with a Desmarres retractor over the orbital rim and the orbital contents with a ribbon retractor to expose the inferior conjunctival fornix.

FIG. 187.6 Transconjunctival incision with a Colorado needle.

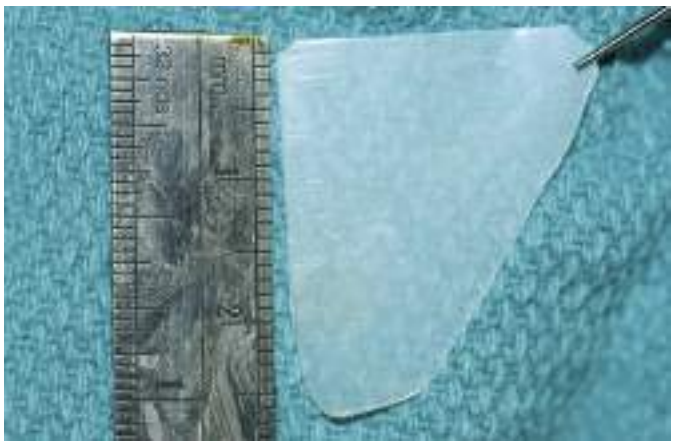

FIG. 187.7 Measurement of a nylon implant.

- Using a monopolar cautery on low power, make an incision through the conjunctiva and soft tissue in an arc curved posteriorly to expose the orbital rim (Fig. 187.6). Alternatively, make an incision between the plica semilunaris and caruncle and use blunt tenotomy scissors to dissect posteromedially toward the posterior lacrimal crest at about 45 degrees from sagittal to avoid the lacrimal drainage system.
- Use a periosteal elevator (such as a Cottle dissector) to elevate the periosteum and retrieve the orbital contents from the sinus. If an extraocular muscle is entrapped by a fracture, either complete the fracture and gently elevate the muscle, or use a Kerrison punch to enlarge the area of impingement.
- Cut and shape the implant material (Fig. 187.7).
- Place the implant using the as an elevator and the ribbon retractor in the other hand and reduce the fracture being hand to be certain that all orbital contents rest above the plate.
- Perform forced ductions (they should either be completely normal or improved over the beginning of the case).
- Fixate the plate, if desired, by placement of a single titanium screw, while being certain to avoid driving this into the infraorbital canal or above the frontoethmoidal suture. As this is not load bearing, it does not need to be driven perpendicular to the plate (Fig. 187.8).
- Place a Penrose or other soft drain into the orbit to rest on the surface of the implant and emerge from conjunctiva to be sutured loosely to lid

skin. It is not necessary to close conjunctiva in either case.

- When repairing a fracture of the orbital floor, place a traction suture (such as 5.0 nylon) through the lower lid and tape to brow to keep the lower lid on upward stretch overnight (Figs. 187.9 and 187.10).

FIG. 187.8 **Fixation of the nylon implant with a titanium screw.**

FIG. 187.9 Postoperative view of a patient with a drain and traction suture in place.

FIG. 187.10 Inferior conjunctival fornix 3 weeks after repair of a blowout fracture via a transconjunctival approach.

Common Errors in Technique

- Making the transconjunctival incision too for anterior can cause vertical shortening of the lid (if the orbicularis contracts during the incision with monopolar electrocautery, reposition the retractor holding the lid).
- Failure to support the implant posteriorly on a shelf of bone will cause the patient to have enophthalmos.
- Trapping of soft tissue under the edge of the implant can cause enophthalmos and diplopia.
- The eye must never be used as a fulcrum.

Postoperative Period

Postoperative Management

- Admit for overnight observation and IV antibiotics with steroid.
- No nose blowing or bending below the waist
- Pain and nausea control
- Remove traction suture and drain in the morning prior to discharge

from the hospital.

Complications

- Postoperative hemorrhage can potentially result in a blind eye and requires emergent management. If the orbit is tight and there is proptosis not easily remedied by lateral canthotomy and cantholysis, take the patient immediately to the operating room for exploration.
- The risk of diplopia after repair of a blowout fracture is difficult to quantify without a randomized, controlled prospective trial. A small retrospective trial of 54 patients who underwent surgical repair found that approximately a third of the patients continued to have diplopia more than 6 months after repair.[8] However, approximately two-thirds of these patients had combined floor and medial wall fractures, thus making the risk greater than after floor fracture alone, for which it is about 10% to 12%. A more recent meta-analysis of diplopia after fracture (442 patients) found that the risk is more than 3 times greater in fractures repaired later than 2 weeks from injury.[9]

Alternative Management Plan

- In considering the general health of the patient, it is best to frankly discuss with the patient that the repair to be undertaken is for aesthetic reconstruction and occasionally to prevent double vision while not treating abnormal cheek sensation or pain. In most instances, it is necessary to undergo surgery to prevent diplopia from persisting. Thus, a patient in her 80s in a nursing home would be a less likely candidate for intervention than a 22-year-old student with a similar-appearing fracture.
- Observation with avoidance of nose blowing for 4 weeks

Discussion

Evidence-Based Medicine Question

What is predictive of enophthalmos or permanent diplopia following a

blowout fracture, indicating need for repair?

Different measurements of increased orbital volume have been suggested with an aim of predicting late enophthalmos. When analyzed by calculation from CT scan, several small studies have shown a correlation between an increase of 11% to 13% in orbital is enough to cause late (measured at later than 1 month) enophthalmos of more than 2 mm, which is generally accepted as cosmetically acceptable. In an analysis of 211 consecutive patients (who all had blowout fractures of either the floor, the medial wall, or both and who were repaired with bone grafting), only 3% of floor fracture patients had enophthalmos at the 1-year follow-up. In addition, 29% of patients who had both floor and medial wall fractures but repair was only performed on the floor had enophthalmos at 1 year.[10]

Editorial Comment

Reading Dr. Tonya Stefkos's chapter on the management of fractures of the orbit was a bit of a trip down memory lane for me. In 1957, Dr. Byron Smith, a well-known Ophthalmologist in New York City described the blowout fracture of the orbit. He saw a patient who had been hit in the eye with a hurling ball and sustained a fracture of the floor of the orbit and complained of diplopia. The mechanism of the fracture was unique since the floor of the orbit was not fractured by the direct force of the ball but rather by the force transmitted by the globe when struck by the ball. The result was a "trap door" fracture of the floor of the orbit, usually medial to the infraorbital canal, with herniation of orbital adipose tissue into the maxillary sinus and often with entrapment of the inferior rectus muscle accounting for the diplopia.

As a resident at the Massachusetts Eye and Ear Infirmary in the early 1960s many blowout fractures of the orbit were seen in the busy eye clinic and were referred to the ENT service for a Caldwell-Luc procedure. This sublabial, transantral approach provided exposure of the fracture site and gave the Ophthalmologist the exposure necessary to release the orbital adipose tissue and the inferior rectus muscle and to reduce the fracture. In large fractures, a plastic implant was inserted to restore the continuity of the floor, but in most of the patients, the reduction of the orbital floor was maintained in place by packing the maxillary sinus with

medicated gauze. I was intrigued by this relatively newly described fracture, and Dr. Lloyd Aiello, a resident in Ophthalmology, and I reviewed the records of all the patients treated in our institution using the technique described above. Our results were similar to those in a more recent report[9] in that early diagnosis and reduction of this fracture (within a 2-week time frame) results in a lesser risk for residual diplopia and enophthalmous.

In the modern era, endoscopic sinus surgery has replaced the Caldwell-Luc procedure when reducing the fracture from below. The transconjunctival approach so eloquently described in this chapter allows for reduction of the fracture and replacement of the orbital contents from above. A plate is then inserted to stabilize the floor and fixated by a single screw. It was interesting for me to observe the evolution in the treatment of this fracture.

Review Questions

1. In what situation is it mandatory that a patient's blowout fracture be repaired immediately?

   a. Presence of traumatic optic neuropathy

   b. Presence of diplopia

   c. Absence of complete abduction of the eye

   d. Entrapped periorbita present on computed tomography (CT)

   e. **Entrapped extraocular muscle suggested by CT**

2. In repairing an orbital floor fracture, which anatomic structure will be encountered and should be preserved?

   a. Lacrimal gland

   b. Frontal branch of the facial nerve

   c. Optic nerve

   d. **Infraorbital neurovascular bundle**

e. Angular artery

3. The efferent limb of the oculocardiac reflex includes all the following, except

   a. Bradycardia

   b. **Diplopia**

   c. Hypotension

   d. Nausea

Osseointegrated Implants

Matilda Dhima

Introduction

The technique of osseointegration was introduced by Per-Ingvar Branemark in the 1980s. The definition of osseointegration as defined by Zarb and Alberktsson is "a time dependent healing process whereby clinically asymptomatic rigid fixation of specifically designed alloplastic materials is achieved and maintained during functional loading."[1] Dental implant therapy has provided an improvement in function and quality of life to replace missing teeth and other structures resulting from surgical ablation of head and neck structures or chemo/radiation therapy.

The recommended parameters for osseointegration are implant biocompatibility, microscopic and macroscopic design of the surface of the implant, host (patient) and implant, surgical protocol, and the loading and prosthetic protocols.[1] Dental implants are made of titanium, with a titanium oxide created on the surface when exposed to air. This oxide layer protects it from corrosion. Osseoinduction and osseoconduction are associated with the healing process.

Growth factors, surface roughness, and the design of the implant body contribute to such healing process. Spraying of various coatings on the surface aims at increasing the surface area of implant body with the goal of increased surface contact with bone as it undergoes the healing process via osseoinduction and osseoconduction. A greater area of surface contact between bone and implant is now considered to be an important factor in the success of implant therapy.

Key Operative Learning Points

- Careful patient selection and patient-centered treatment

- Anatomic region and associated defects from ablation or chemo/radiation therapy are crucial in planning.
- Multidisciplinary management
- Presurgical planning
- Radiation therapy greater than 55 Gy
  - Not a contraindication to implant therapy
  - Greater risk of implant failure
  - No consensus on appropriate time of implant placement
- Hyperbaric oxygen therapy (HBO) if prior radiation therapy
  - Research has not shown a significant impact of HBO therapy.
- Medical comorbidities affecting healing, immune state; smoking, diabetes, oral bisphosphonates, periodontal disease
  - Not contraindications
  - Higher risk of implant failure
- Dental implants can be placed in microvascularized fibula free flaps with or without prior radiation therapy
- Surgical technique
- Management of peri-implant soft tissues is required especially in reconstructions using fibula microvascular transfer
  - Stable peri-implant soft tissue
- Tissue management procedures include one or a combination of
  - Vestibuloplasty
  - Lip switch vestibuloplasty
  - Skin grafting
  - Rigid splinting with implant prosthesis
- Loading protocols of dental implants with prosthesis in patients with large defects or radiation therapy are often staged.
- Regular monitoring of patients is very important to

- Manage events
- Complications
- Monitor for recurrent disease

Preoperative Period

Unlike natural teeth, dental implants are not at risk for caries, but they are at risk for developing peri-implant mucositis. Recent systematic reviews have shown no significant difference in implant survival at up to 10-year follow-up between patients with no gum (periodontal) disease and those with periodontal disease.

Osteoporosis, diabetes, immunosuppression, and the use of oral bisphosphonates continue to be evaluated, and current evidence shows a slightly higher risk of implant failure in this patient population. However, this does not mean that dental implants are contraindicated in this patient population. Rather, adequate screening and surgical and prosthetic planning with close communication with the managing physician are key to positive outcomes. Studies addressing other medical comorbidities, such as cardiovascular diseases, hypothyroidism/hyperthyroidism, human immunodeficiency virus (HIV), acquired immunodeficiency syndrome, ectodermal dysplasia, and scleroderma have shown no increased failure rate of implants in these patient populations when the comorbidity is medically controlled. It is important to note that these studies remain small in number and more research is needed in this area.

Ultimately, a multidisciplinary approach and patient-centered treatments are key to providing such therapy (Fig. 188.1). Realistic patient expectations and understanding of treatment, especially for maintenance, as well as expected and unexpected events play an important role in acceptance of dental implants. The longest follow-up to 29 years from a patient population at the Mayo Clinic revealed that mechanical events (associated with the prosthesis) occurred approximately three times more often than biologic events (associated with the implants) in edentulous patients treated with dental implants (Figs. 188.2 and 188.3).[2] This same study showed that 92% of prostheses had an overall survival, free of implant failure; however, only 15%

survived free of any event. This means that long-term management of the prosthesis is key to improving treatment outcomes.

History

History of Present Illness

Intraoral Defects

1. Extent of structures affected by disease or tooth deficiency
    a. Arch of the maxilla or mandible
    b. Natural teeth present
    c. Periodontal health
    d. Buccal tissues, tongue, speech, soft palate affected
        1) Lip competency
        2) Impaired tongue movement
        3) Impaired soft palate movement
        4) Tethering of intraoral/extraoral tissues
    e. Risk of aspiration
    f. Current quality of life
    g. Weight loss
    h. Experience with removable prosthesis, such as dentures or obturators
2. Current medical, social history associated with higher risk of implant failure
    a. Smoking
    b. Radiation therapy
    c. Conditions affecting healing (bone, soft tissue, immune status)
    d. Psychological status
    e. Manual dexterity

3. Any reconstruction present

FIG. 188.1 The panoramic radiograph of a patient treated with an implant-supported prosthesis in the maxilla and implant-retained prosthesis in the mandible. The final prosthesis is in place. A digitally designed and milled titanium bar connects the implants and is part of prosthesis.

   a. Bone grafting

   b. Microvascularized fibula free flap

      1) Bulkiness of flap

      2) Mobility of flap

      3) Tethering of adjacent structures

4. Patient expectations of treatment

   a. Esthetics

   b. Function

   c. Quality of life

5. Patient age and location in need of dental implant

   a. Vertical growth of the face is the last to stop. Delay implants in anterior maxilla until growth has plateaued.

   b. If not, teeth on dental implants will look shorter than the rest of the natural teeth

Extraoral Defects

In addition to previous items, assess

1. Presence of skin tags
    a. Ear lobe (retain)
    b. Cartilage remnants
    c. Muscle activity
        1) Twitching
        2) Excessive movement of skin adjacent to defect when speaking/smiling
2. Social activities
    a. Sweating, spending long time outdoors (medical adhesive cannot retain prosthesis)
    b. Makeup use (helps to mask demarcation of prosthesis outline)
3. Location of defect
    a. Any remaining ala, unsupported nasal tip, lip tethering, turbinates
        1) Interfere with stability of prosthesis
    b. Presence of teeth
        1) May affect placement of air implant in the maxilla (nasal prosthesis)
        2) Long-term edentulism
            a) Patients may have very thin anterior maxilla.

FIG. 188.2 Final prosthesis on models prior to insertion for same patient. The maxillary prosthesis is supported by a milled bar connecting dental implants. The maxillary prosthesis is removable by the patient. This design allows for establishing lip support and cleaning of implant parts by removing the prosthesis. The mandibular prosthesis is implant retained and cannot be removed by the patient. The cleaning is done by flossing under the prosthesis. No flange is needed for lip support here in the mandible.

FIG. 188.3 The same patient with both prostheses in

place.

Past Medical History

1. Detailed review of systems

   a. Social history (smoking, alcohol use, drug addiction)

   b. Dental history

   c. Pattern of tooth loss, periodontal disease

   d. Medications and allergies

2. Assess what from above would affect patients during surgical procedure and recovery as well as healing and prosthetic rehabilitation.

3. Obtain medical consultation describing the procedure of implant therapy including

   a. Commonly prescribed medications after implant placement, which may include antibiotics, steroids, nonsteroidal anti-inflammatory medications

4. Identify what affects the patient during the implant placement procedure

   a. Cardiovascular system

   b. Endocrine

   c. Respiratory

   d. Neurologic

5. Identify medication or systemic conditions that impact healing

   a. Blood disorders

   b. Medication for osteoporosis

   c. Immunosuppressive drugs

   d. Unstable diabetes

   e. Unstable thyroid disorders

   f. Smoking

   g. Psychiatric disorders

6. Previous history of radiation therapy
    a. Dosage
    b. Mapping
7. Previous history of malignancy
    a. Structures affected
    b. Location
    c. Adjuvant therapies
    d. Types of reconstruction
8. Previous experiences with dental therapy
    a. Any problems with prosthesis
    b. Healing issues
    c. Loss of implants
9. Identify length and extent of surgery with dental implant placement.
    a. Assess systemic conditions.
    b. Ability to metabolize large amounts of local anesthetic specifically liver, kidney, heart
10. Social and mental status
    a. Informed consent ability
    b. Manual dexterity
    c. Swallowing challenges
    d. Speech challenges
    e. Psychologic status
    f. Ability to tolerate transitional prosthesis

Physical Examination

Extraoral Examination

1. Facial asymmetry

a. Presence of intraoral defects in the buccal and mandibular angles

b. Neurologic deficit

c. Evaluate profile, which can give an initial idea of most likely skeletal relationship of jaws.

2. Lips

a. Incompetence of the lips

b. Lip length and thickness

c. Perioral limited oral aperture

d. Any tethering of the vestibules in the maxilla or mandible as a consequence of surgical ablation

e. Drooling

3. TMJ

a. Temporo mandibular joint (TMJ) disorders

b. Limitations or deviation upon opening, closing, clicks, crepitus

c. Complications such as mastication muscles atrophy from radiation therapy or ablation

d. Constriction of mouth opening from perioral structures due to ablation, radiation therapy

These limit access to the oral cavity for implant placement and prosthetic rehabilitation.

4. Presence of unusual skin topography, swelling, edema, or lesions suspicious for malignancy

5. Extent of any missing facial structures

a. Orbital area, face, and auricular areas

1) Muscle activity

2) Prosthesis movement

b. Skin tags must be removed.

c. Bony structures including

1) Mastoid area, tuberosities in nose, nasal bridge, orbital rims

Intraoral Examination

a. Status of remaining ridges, sizes and location of defect from respective surgery, condition of saliva or mucositis from radiation therapy

b. Shape of arches in maxilla and mandible

c. Any discontinuity in arches and discrepancies in their size

d. Identification and tethering of vestibules, lip, cheek, or tongue (with mandibular arch) suggestive of ablative or reconstructive surgery

e. Look for areas of exposed bone.

1) Recurrence of the cancer

2) Poor healing

3) Osteoradionecrosis (ORN)

f. Assess for unusual lesions that may warrant biopsies.

g. Evaluate remaining teeth.

h. Assess presence and movement of tongue and soft palate.

i. History of radiation therapy

1) Incompetency (neurologic)

2) Insufficiency (mechanical, surgically removed, or revised)

j. Limited tongue movement

1) Revise

2) Release tethering

3) Debulk

4) Hyperplasia

1. Swallow

a. Percutaneous endoscopic gastrostomy (PEG) tube, reason it is in place

b. modified barium swallow (MBS) study

c. Large defects

d. Aspiration risk

2. Speech
   a. Articulating errors
   b. Hypernasal, hyponasal speech
   c. Tongue movements
3. Neck
   a. Lymphadenopathy
4. Overall health and disposition

Imaging

1. Panoramic radiographs
2. Full mouth series of radiographs
3. Lateral cephalogram
4. Cone beam computed tomography (CT)
   a. If multiple implants are placed
   b. When bone quality or quantity is questionable
   c. When conducting presurgical virtual planning
   d. When planning virtual or guided implant therapy
   e. Cases involving multiple implant placement
   f. Zygomatic implant placement
   g. Cranial implants
   h. Sinus lift, augmentation
5. Magnetic resonance imaging (MRI)
   a. Only when suspecting pathology; thus rarely needed
6. CT with three-dimensional (3D) imaging reconstruction
   a. Resection, implant placement
   b. microvascularized fibula free flap (MVFF)

c. Nerve lateralization

d. Jaw surgery

Indications

1. Partially edentulous
2. Poor function with removable prosthesis
3. Support extra oral prosthesis
   a. Large defects
   b. Difficulty with using adhesive
4. Support intraoral prosthesis
5. MVFF
6. With surgical ablation of head and neck defects
7. Improve function, quality of life

Contraindications

1. Refractory patients with previous unsuccessful implant, prosthetic therapy
2. Unrealistic expectations of treatment outcomes
3. Medical comorbidities where procedure risks outweigh benefits
4. High risk for cancer recurrence
5. Poor patient compliance
6. Inability of informed consent

Preoperative Preparation

Team evaluation by some or all listed here, depending on complexity of case and structures to be reconstructed surgically and/or prosthetically

1. Head and neck surgeon

2. Plastic surgeon
3. Oral surgeon
4. Speech/swallow therapist
5. Medical/radiation oncologist
6. Prosthodontist/maxillofacial prosthodontist
7. Preoperative evaluation team
8. primary care physician (PCP) or other medical specialties
9. Anesthesia
10. Postoperative care
11. Nutrition

Operative Period

Anesthesia

- Local anesthesia
- Sedation
- Antianxiety medications—sometimes
- General anesthesia—long and complex procedures
  - Blood chemistry
  - Follow-up of any abnormal values
- A nasogastric feeding tube for large reconstructions
- A tracheostomy, large resections, mandibular reconstruction, airway compromise

Positioning

- Dental chair or operating room (OR)
  - Depending on arch location, the patient may be at 25 to 30 degrees

reclined or laid back at approximately 10 to 15 degrees.

- Surgeon, patient comfort, ease of access to implant placement

Perioperative Antibiotic Prophylaxis

- Sterile setup
- Surgical area decontaminated
- Intraoral chlorhexidine gluconate oral rinse
- Antibiotic coverage may start 5 to 10 days before procedure and/or administered during anesthesia induction
- Antibiotic coverage 5 to 14 days after procedure
  - Amoxicillin, penicillin, clindamycin, cephalosporins, metronidazole

Monitoring

Implant Therapy

- Identify, avoid perforations
- Avoid overangulation of implant drills to keep proper implant position.
- Use surgical guide to ensure proper implant location, angulation
- Use ample irrigation to avoid bone overheating.
- Assess clinically for good bone quality and quantity to help initial implant stability.
- Identify, mark, avoid nerves
- Identify curve of mylohyoid as landmark to avoid floor of mouth perforation
- Check for excessive bleeding.
- Routine general anesthesia/sedation monitoring
- Assess and record type of implant and stability achieved.

- Assess for proper distance between implants adjacent to teeth or other implants.
- Ensure adequate stable peri-implant tissues, consider performing debulking and/or skin grafting

Flap Reconstruction

- Coronary artery disease (CAD), diabetes, blood dyscrasias at higher risk for flap failure
  - Consult cardiologist, endocrinologist, hematologist
- Avoid areas of compression/tension.
- Observe, control anastomosis
- Consider Doppler use.
- Consider anchor sutures.
- Avoid tracheostomy ties.
- Monitor flap for failure, arterial/venous compromise thrombosis
- First 24 to 48 hours are critical, ensure clinical monitoring of reconstruction, hourly recommended
  - Visual inspection, color, size, temperature, perfusion
  - Other monitoring methods
    - Handheld Doppler use
    - Licox tissue oximeter
    - Laser/implantable Doppler
  - This allows for attempts to salvage reconstruction.
- Blood count/chemistry to avoid anemia, thrombosis
- Ensure patient hydration.
- Bed rest, nothing by mouth (NPO) for first 24 hours
- No consensus on type or dosage of anticoagulation to use
  - Studies suggest aspirin and subcutaneous heparin alone or in

combination for postoperative anticoagulation after free tissue transfer.

Instruments and Equipment to Have Available

1. Standard dental (oral surgery) set

2. Implant placement set with appropriate drill series for type of implant system used

3. Various implant sizes

4. Various healing abutment and cover screw sizes

5. Various screw sizes and impression copings if a prosthesis is connected to dental implants at time of surgery

6. Prosthetic components

7. Sometimes, plates—prefabricated by virtual planning, prebent, or standard

8. Preprosthetic surgical guides (Fig. 188.4)

9. Electrocautery

10. Surgical loupes

11. Oscillating saw for alveolectomy

12. Slow-speed burrs for bone re-contouring, alveoloplasty

13. Chromic gut sutures

14. Bone grafting material (bovine, cadaver, harvested from the patient)

FIG. 188.4 A surgical guide in place during implant placement. The guide reflects the planned tooth positions to mimic final restoration.

15. Standard instruments for head and neck surgery if concurrent resections

16. Standard microvascular reconstructions if concurrent resections

17. Prosthodontic impression, conditioning materials for prosthesis delivery

18. Saline solution

19. Chlorhexidine rinse

Key Anatomic Landmarks

The most common anatomic regions in the head and neck area for consideration of osseintegrated implant therapy can be categorized as intraoral and extraoral.

Intraorally

- Maxilla
- Mandible
- Native alveolar ridge
- Adjacent teeth and roots

- Sinus floor
- Nasal floor
- Bone-grafted sites
- Zygoma
- Areas reconstructed with a fibula microvascular free flap
- Vestibule
- Nerve foramen: mental, infraorbital, lingual
- Curvature of mandible (mylohyoid)
- Lip competence
- Tuberosities

Extraorally

- Facial bones (Fig. 188.5)
- Maxilla
- Orbital rim
- Lateral rim and malar body
- Mastoid area (Fig. 188.6)
- Anterior nasal floor (in edentulous patients)

FIG. 188.5 A custom-designed bar connecting two cranial implants for support of an auricular prosthesis.

FIG. 188.6 A view of patient in Fig. 188.5 with auricular prosthesis in place.

- Lateral walls of pyriform aperture (in dentate patients)

- Rarely glabella with known unreliable outcomes

Prerequisite Skills

- Dental tooth anatomy and root morphology
- Understanding of differences in arch shapes, bone quality and quantity
- Anatomy of the head and neck
- Parameters for minimum distance between implant to implant, implant to teeth
- Management of complications such as
  - Sinus perforation
  - Nasal floor perforation
  - Floor of mouth perforation
- Identify key anatomic landmarks.
- Implant placement protocol
- Teeth extractions
- Skin grafting
- Plating
- Alveolectomy, alveoloplasty
- Understanding implant components
- Presurgical planning prosthetic, virtual
- Harvesting/completing grafting tissue/bone

Surgical Technique

Presurgical Planning Prosthetic or Virtual

- The presurgical planning is key to a predictable outcome whether for a single dental implant in an otherwise healthy and dentate patient to a more complex patient. In consultation with prosthodontist the

appropriate location, size, and restoration type are determined.

- Transitional prosthesis are often fabricated.
- These are inserted at the time of the implant placement or later.
- They serve as transitional prosthesis and oftentimes as a guide to the definitive prosthesis.
- Surgical guides are used and fabricated based on the final prosthesis plan.
  - They give information in need for additional procedures such as
    - Alveolectomy or alveoloplasty to accommodate implant components and allow adequate space for prosthesis
    - Need for tissue management in peri-implant areas
    - Need for sinus lift
    - Bony or tissue augmentations

- The maxillary and mandibular bones are associated with varying degree of bone quality and quantity, which serve an important role in the planning, surgery, and treatment outcomes with implant therapy.
- The more remaining healthy teeth, the better the outcome for patients.
- Dental implants can be placed in remaining native bone or fibula reconstructions.
- Implant therapy is dictated by type of disease process, adjuvant chemoradiation therapy, and involvement of adjacent structures.

Surgical Approach

- An incision is made to access the bony ridge.
- A crestal incision provides better access to the bony ridge, especially if multiple implants are placed.
- In the maxilla, a palatal incision can be made to minimize risk of implant exposure, allow adequate tissue approximation
- An H-shape incision
- If adjacent teeth are present, the incision is carried through the sulcus

of the adjacent tooth.

- The base of the flap should be wider to allow for ample blood supply.
- For more conservative approaches, especially in cases of aesthetic area and single teeth implants, a no flap technique can be used.
- Based on presurgical planning and imaging, the location of implants and the distance between teeth and implants are established
- Bone grafting procedures concurrent or staged are completed prior to or after the implant insertion.
- The tooth extractions planned are completed as atraumatically as possible.
- Tissue management procedures are completed in a staged fashion.
- Alveolectomy or bony recontouring is completed with surgical guides to help.
- Establish the osteotomy site with a small round burr based on presurgical planning.
  - This is more difficult to establish if placing implants at same time of a large bony reconstruction, such as MVFF.
- Usually the osteotomy is placed in the middle of the crest, equidistant if in between two teeth and equidistant if multiple implants unless otherwise planned preoperatively.
- Stay more palatal for anterior maxilla.
- Stay no closer than 4 mm from adjacent teeth.
- Stay no closer than 7 mm from adjacent implant.
- Use ruler and surgical guides to measure and check.
  - Based on well-established guidelines,[3] a simple example shows that a 3.5-mm platform implant should be
    - No less than 3 mm from adjacent implant
    - No less than 2 mm from adjacent tooth
    - Modify implant size (hence platform) to manage above distances
- Incrementally increase osteotomy size (Fig. 188.7) following the

established sequence of drills in the implant placement kit to the desired depth and size (based on presurgical planning and radiographic imaging).

- Use a position marker to assess depth, parallelism (Fig. 188.8), and direction/angulation of the osteotomy while increasing your osteotomy to desired implant dimensions.

FIG. 188.7 Osteotomy is being prepared with a drill in a sequence. Note the gray lines on the drill are a guide to the depth of osteotomy.

- The goal is to have a direction as close to the path of insertion of the prosthesis as possible and multiple implants parallel to each other.
- It is easier to correct the angulation at early stages of narrow and shorter osteotomy.
- Avoid attempts to correct your osteotomy position and angulation when osteotomy size is larger or close to desired width and depth.
  - In these situations, it is best to leave correction for prosthetic components.
  - Correcting osteotomy angulation and location late in the osteotomy series results in a large osteotomy that will not receive a stable implant body and poor initial bone-to-implant contact.
- Use internal irrigation to minimize bone trauma.

- Use a stable up/down motion when creating the osteotomy.
- Do not use pressure from your wrist drilling down in one direction.
- Use condensers in low-density bone.
- Bone tappers and hand reamers should be considered to use in high-density bone.
- If resistance is met during implant insertion with incomplete seating of the implant body
  - Check again your osteotomy depth and drill used.
  - If the above is correct, remove the implant first by a few turns and use the implant as a tapper.
  - Sometimes the whole implant is retrieved, the thread is tapped, and the implant is reinserted.
  - After the implant is inserted (Fig. 188.9), the clinician should obtain an idea of the stability of implant, based several factors.
    - Type of bone quality and quantity
    - Bone-to-implant contact
    - Insertion torque (Ncm) used to place implant
      - An initial insertion torque of 30 to 45 Ncm is often associated with good stability, but it is not the only parameter.
- If the implant is not stable to receive a prosthesis or additional tissue management is required, a cover screw is placed, and the flap is closed.
- If the implant is stable to receive a prosthesis, implant components are seated, and the prosthesis is either immediately loaded or immediately placed without loading (not in function).

FIG. 188.8 Guide pins in place to assess parallelism in preparation for placement of dental implant.

FIG. 188.9 Dental implant being guided into the osteotomy site.

- Any additional bone grafting or tissue management procedures mentioned previously may be completed.
- Healing abutment may also be placed.

- *Edentulous/partially dentate patients with intraoral defects*

Maxilla

- The native remaining alveolar ridge is often the first consideration for placement of the dental implant.

- In cases of severely resorbed native remaining alveolar ridge, zygomatic implants can be considered if structure remains on defect side after resection.
- In edentulous remaining alveolar ridge, two, four, or six implants are sufficient. A locator is a part that will connect dental implants to obturator, denture, or crown.
- Zygomatic implants are considered as a last resort for maxillary defects.
- Access to implant is often very difficult for the maxillofacial prosthodontist due to its angulation in the oral cavity.

Mandible

- Similar concepts apply
  - Wide distribution of dental implants for force distribution
  - Due to inherent mobility of perioral structures (lips, tongue, cheeks) consider
  - lip-switch vestibuloplasty
  - Skin graft
- *Mandibular reconstruction with microvascularized fibula free flap reconstruction*
  - Always problems with tissue hyperplasia
    - Pain
    - Erythema
    - Food entrapment
    - Peri-implantitis
    - Bone loss around implants
    - Implant failure
    - Inability to wear prosthesis
  - Mobility and bulkiness of flap affect:
    - Speech

- Space implant components, prosthesis
- Pain
- Peri-implantitis
- Bone loss

- Must provide immobile peri-implant tissues
  - Debulking
  - Vestibuloplasty
  - Skin grafting, rigid splint

- *Maxillary reconstruction with microvascularized fibula free flap reconstruction*
  - May replace only missing teeth in reconstruction
    - Only if defect is small
    - Present remaining teeth in maxilla
  - Large or complications result in acquired fistulas
    - Consider dental implants (Fig. 188.10).
    - Native bone
    - Fibula
  - Ensure a good bony union.
  - Provide "tall" and "wide" enough fibula sections to support lengths (6, 10, and 13 mm) of dental implants.
  - Virtual surgical planning to optimize outcome
  - Dental implants are sometimes at same time of reconstruction
    - High degree of inaccuracy for location due to loss of anatomic landmarks
    - Very often, implants end up too palatal or projecting to cheek area
    - Rendered useless
    - Often best to place in staged approach

FIG. 188.10 A patient with a microvascular fibula free flap reconstruction experienced a fistula after healing and adjuvant radiation therapy. Note dental implants were placed at same time as reconstruction. Most distal implant is very buccal and has a projection to the cheek. Also noted is the bulkiness of flap.

- *Adjuvant/neoadjuvant chemo/radiation therapy*
  - Implant placement is often completed 6 to 12 months or longer after radiation therapy.[4]
  - Because osseointegration requires 2 to 6 months, most of these patients cannot delay adjuvant therapy.
  - Sometimes, may place at resection of neoplasm
    - Predictable in native bone
    - In MVFF, best to do after recovery from adjuvant therapies
      - Control of implant placement by planning the prosthesis design
  - Research and clinical experience on benefit from HBO therapy
  - A Cochrane review has shown no additional benefit to HBO therapy when placing dental implants in radiated bone.[5] Longer healing times and monitoring for adequate healing are recommended.
  - The best protocol to load (connect function prosthesis) in this patient population is to delay it or otherwise complete in stages, ensuring stability and waiting for osseointegration of implants.
  - Interaction of the multidisciplinary team including surgeon ear, nose

and throat surgeon (ENT), plastic surgery, oral maxillofacial surgery), maxillofacial prosthodontist, oncologist, speech/swallow therapist

- High risk of recurrence
  - Monitoring is essential.
  - Biopsies

Common Errors in Technique

- Incorrect flap design resulting in lack of access to implant site placement, poor blood supply, loss of tissue
- No presurgical planning and multidisciplinary approach
- No discussion of patients' realistic expectations
- Not following systematic drills for creation of the osteotomy
- Not using drill guides
- Inadequate buccal lingual positioning and distances between teeth, implants
- Poor closure technique
- Lack of tissue management to provide stable peri-implant tissues

Operative Risks

- Bleeding
- Perforation into key anatomic structures
  - Floor of the mouth
  - Sinus/nose
- Paresthesia, inferior alveolar nerve
- Areas of non-bony union if fibula reconstruction
- Loss of blood supply to MVFF
- Inability to place dental implant due to poor bony quality, quantity

- Inability to achieve primary closure due to tissue tethering

Postoperative Management

- Antibiotic coverage and bacteriostatic/bacteriocidal oral rinses
- Pain management
- Monitor flap viability when applicable.
- Loading or restoration with any prosthesis
- Follow up to monitor healing, remove any sutures
- Monitor diet modification.
- Follow up with rest of surgical and rehabilitation team.
- Complete any additional HBO therapy when feasible.

Complications

1. Flap failure[8]
    a. Surgical procedure complications
        1) Critical first 24 hours to 5 days postoperative
        2) 5% to 25% may need re-exploring postoperatively due to poor circulation.
        3) Highest failure risk initial postoperatively
        4) 3% to 4% failure rates reported
        5) Microvascular thrombi first 2 to 5 days postoperatively
        6) 54% to 63% reported thrombosed vessels.
    b. Attempt salvage.
        1) Avoid compression/tension areas.
        2) Anchor sutures.
        3) Observe anastomosis before wound closure.
        4) Monitor buried flaps (pharyngeal, tongue) clinically.

2. Implant loss

   a. If no primary stability, cover implant, uncover at second stage

   b. Consider native bone first for implant therapy to improve success rate.

   c. Smoking cessation counseling

   d. HBO therapy consideration if implant in irradiated bone

   e. Monitor hgA1C in diabetic patients.

   f. Provide stable peri-implant tissues with debulking and skin grafting.

   g. Ensure bony union of fibula and native bone to avoid iatrogenic fractures.

3. Prosthetic complications

   a. Consider a simple, easy to maintain prosthesis.

   b. Counsel on diet and oral hygiene to minimize peri-implantitis

Alternative Management Plan

1. Tooth, tissue-supported prosthesis

2. No further treatment

Discussion

Evidence-Based Medicine Question

What is the success of implant therapy in patients with radiation therapy?

Studies have shown that smoking and a history of radiation therapy, especially when greater than 55 Gy, increase the risk of implant failure. This does not mean that implant therapy is contraindicated in smokers and patients with radiation therapy. Patient selection and awareness of higher implant failure are key to treatment and management of this patient population with implant therapy.

There is no current consensus on the most appropriate time to place

dental implants in patients who have had radiation therapy whether in native bone, grafted bone, or fibula.

Current literature supports dental implant therapy between 6 and 12 months after radiation therapy or during ablation surgery and before radiation treatment.[4,6]

A recent meta-analysis has shown acceptable survival rates when dental implants are placed on native or grafted bone, whether irradiated or not. However, radiation therapy was associated with higher risks for failure.[7]

Editorial Comment

Maxillofacial and oral prosthodontists design prosthetics (facial, dental, palatal, or tongue prostheses), provide medical therapy, and adjust environmental factors to aid in the rehabilitation of cosmetic as well as functional deficits (i.e., speech and swallowing disorders). Oral and oropharyngeal prostheses help to compensate deficits by optimizing the remaining function, improving valving and bolus propulsion.

Prosthetic rehabilitation is led by a prosthodontist; however, its implementation requires input from all members of the care team, especially the head and neck surgeon and speech language pathologist. For example, a speech language pathologist must assess the speech and swallowing function before, during, and following the fitting of the prosthesis to evaluate its effectiveness. After the device has reached its final fitting, the speech language pathologist establishes a rehabilitation program that maximizes the value of the prosthesis.

Maxillofacial prosthesis can reproduce an organ, such as the nose or the ear, more accurately than a reconstructive surgery. Therefore prosthetic rehabilitation is a critical consideration for the restoration of quality of life in patients needing oncologic head and neck surgery.

Review Questions

1. Parameter(s) for osseointegration include all of the following, except

a. **Arch shape**

b. Implant biocompatibility

c. Surgical protocol

d. Loading protocol

2. A lower risk for implant failure is associated with:

a. Unstable diabetes

b. Osteoporosis

c. Immunosuppression

d. **None of the above**

3. All of the following are important considerations in implant therapy, except

a. Presurgical planning

b. Ample irrigation

c. Peri-implant tissue management

d. **Tooth color**

SECTION 23

Pediatrics—Nasal Cavity

OUTLINE

189. Choanal Atresia/Pyriform Aperture Stenosis

190. Midline Nasal Masses

189

Choanal Atresia/Pyriform Aperture Stenosis

Amanda L. Stapleton, and Scott Manning

Introduction

Nasal obstruction in the neonate can lead to severe respiratory distress and failure to thrive if not properly identified and treated. Newborn infants are obligate nasal breathers; therefore, nasal airway obstruction has significant downstream effects. Cyclic apnea, cyanosis, and respiratory distress temporarily relieved by crying should elicit a high index of suspicion for nasal airway obstruction. In the neonate, this can be caused by bilateral choanal atresia or pyriform aperture stenosis (PAS).

Choanal atresia is an excess of mesenchymal tissue that creates an atretic plate that separates the posterior nasal cavity from the nasopharynx. It is believed that the pathogenesis is a persistence of the buccopharyngeal membrane during weeks 4 to 11 of development or a failure of the oronasal membranes to rupture. There are also additional anatomic anomalies that accompany choanal atresia that can compromise the nasal airway. These include septal deviation to the obstructed side, medial bowing of the lateral nasal wall, medialized pterygoid plates, widened vomer, and a narrow nasopharynx. Unilateral atresia is more common than bilateral with the right side more common than the left. Thirty percent are purely bony, and 70% are mixed membranous and bony atresia. Up to 49% of patients with bilateral choanal atresia have an associated congenital malformation. CHARGE syndrome (coloboma, heart disease, choanal atresia, retardation of growth, genital hypoplasia, and ear anomalies), Treacher Collins Syndrome, Crouzon's, Apert's syndrome, or Trisomy D have all been found to be associated with bilateral choanal atresia.[1] Unilateral choanal atresia may not be

recognized until later in childhood, adolescence or early adulthood. Patients can present with unilateral nasal obstruction, mouth breathing, rhinorrhea, sinusitis, or loss of their sense of smell.

Congenital nasal PAS is a rare form of nasal airway obstruction. It is caused by medial positioning or overgrowth of the medial nasal process of the maxilla. The pyriform aperture is the narrowest part of the nasal airway. Therefore, any decrease in size can cause significant nasal obstruction in the neonate. These patients have a similar presentation to infants with bilateral choanal atresia. They have nasal obstruction, inability to pass a nasogastric tube, respiratory distress, cyanosis, and feeding difficulty. The diagnostic criteria for PAS is a width less than 11 mm measured as the total width between the medial aspect of the maxilla at the level of the inferior meatus. In addition to PAS, the nasal cavity is also found to have narrowing of the midnasal and choanal regions. Other associated findings with PAS include median central incisor, a triangular-shaped palate, and a medial palatal ridge. If the patient is found to have a median central incisor on computed tomography (CT) scan, then a magnetic resonance imaging (MRI) should be performed to evaluate for holoprosencephaly spectrum disorders. Genetic work up is also recommended if a central neurologic anomaly is suspected.

Key Operative Learning Points

- Endoscopic technique can provide excellent visualization of the choana and entire nasal cavity/airway.[2]
- Resection of the hypertrophied vomer and posterior septum is essential in preventing restenosis
- Postoperative stenting has not been shown to improve outcomes in choanal atresia repair patients.[3] However, stenting should strongly be considered/used in the neonate after repair to provide a patent nasal airway. They are also recommended for use in patients with CHARGE association. The stent provides a reliable nasal airway that gives immediate relief to neonatal nasal obstruction while the operative site is healing.
- Syndromic patients (CHARGE) have a lower success rate due to their

cardiopulmonary medical issues. They can have a flat skull base and less room for repair in the nasopharynx. They have a higher chance of requiring a tracheostomy in early infancy to establish a stable airway.

- Routine endoscopy and removal of crusting and granulation 7 days after surgery improves postoperative outcomes.[4]
- Infants (<28 days old) likely require several postoperative dilations after trans-nasal repair. This can be performed in the operating room or in the office with ureteral dilators. Balloon dilators can also be used in the operating room (OR) or office setting.
- Mitomycin C has not been shown to decrease restenosis rates in large meta-analysis studies. However, some studies show a trend toward reduced granulation tissue formation and decreased re-stenosis in the neonate population when used during initial surgical repair. This should be considered in the neonate population.
- Failure to reduce the inferior turbinates in PAS can also lead to failure and the need for surgical airway intervention.

Preoperative Period

Bilateral choanal atresia can lead to a medical emergency with cyclical desaturations, cyanosis, and distress in the neonate. It must be expeditiously evaluated and treated to prevent respiratory distress and prolonged intubation. A McGovern nipple can be used to help maintain the infant's airway. This can also allow the infant to start feeding in most cases. If the infant continues to have respiratory distress with the McGovern nipple in place, then laryngotracheal mask (LMA) or endotracheal intubation may be required. In some circumstances, a tracheostomy may need to be performed if the definitive repair needs to be delayed due to other health issues (i.e., cardiac disease). PAS can lead to the same clinical presentation due to the bilateral nasal obstruction it causes. Unilateral choanal atresia can often be managed less urgently. Most infants are able to maintain a nasal airway without a McGovern Nipple or intubation until a repair is performed.

Inability to pass a 6 French nasogastric catheter through the nasal cavity/nasopharynx and absence of fogging of a mirror when placed beneath the nose all point to possible choanal atresia/PAS. This should

then be evaluated by an Otolaryngologist who can perform a bedside nasal endoscopy to look for patency of the nasal cavity and posterior choanae. If the flexible scope cannot be passed through one or both sides of the nose, then a CT scan is indicated to evaluate the nasal cavity and choanae. The CT scan can also be used to evaluate the inner ear for anomalies associated with many of the related syndromes.

PAS should initially be treated medically, and surgery is then recommended if the conservative management does not provide an adequate nasal airway in the neonate. Conservative management includes using saline nasal drops, oxymetazoline spray, nasal corticosteroid drops, temporary stenting of the anterior nares if possible with a nasal airway, and use of a McGovern nipple. The traditional surgical management of PAS is a sublabial drill out procedure with stenting. Recent studies have also reported addressing the inferior turbinate as it arises from the lateral border of the pyriform aperture and can contribute to nasal airway narrowing/obstruction. Dilating the pyriform aperture using ureteral/cervical dilators or balloon provides a nondestructive surgical option to open the pyriform aperture. There are no current literature guidelines for when surgical management of PAS is required. Some authors suggest that nasal obstruction with respiratory distress, apnea, or feeding difficulties requires surgical management, and other studies have suggested that width <5.7 mm is associated with surgical management.[5]

All patients should be consented for a direct laryngoscopy and rigid bronchoscopy as part of a complete airway evaluation at the start of the surgical procedure. There is a risk of laryngomalacia, tracheomalacia, and subglottic stenosis in this cohort of patients. Identifying a secondary airway lesion can be imperative in postoperative management of these patients. Pre and postoperative gastroesophageal reflux disorder (GERD) management is also important in these patients.

History

1. History of present illness

   a. Respiratory distress since birth?

   b. 5-French nasogastric tube—pass through both nasal cavities?

c. Cyanotic episodes

d. Cyclical desaturations with crying

e. Feeding difficulty?

f. Poor weight gain

2. Past medical history

a. Premature or full-term infant?

b. Other congenital anomalies?

c. CHARGE syndrome?

d. Genetic disorders in the family?

e. Prenatal screening?

Physical Examination

1. Nasal endoscopy: flexible fiberoptic nasal endoscopy: evaluate for narrowing at the pyriform aperture, mid-nasal cavity, and the nasopharynx. Are both choana patent?

2. Head and neck examination: other congenital abnormalities: cleft lip/palate, midface hypoplasia, concern for central incisor, eye examination

3. Facial examination: evidence of deformity: upper lip, eye, midface

4. Airway—evidence of stridor, sternal retractions, stertor, nasal flaring

Imaging

1. CT maxillofacial with and without contract with image navigation—evaluate the choana for evidence of a bony, membranous, or mixed atretic plate. Evaluate posterior septum (widened vomer), medialized ptyergoid plates, and configuration of lateral nasal wall. Measure the width of the pyriform aperture on axial CT scan. If PAS is evident, evaluate for central incisor (Fig. 189.1A and B).

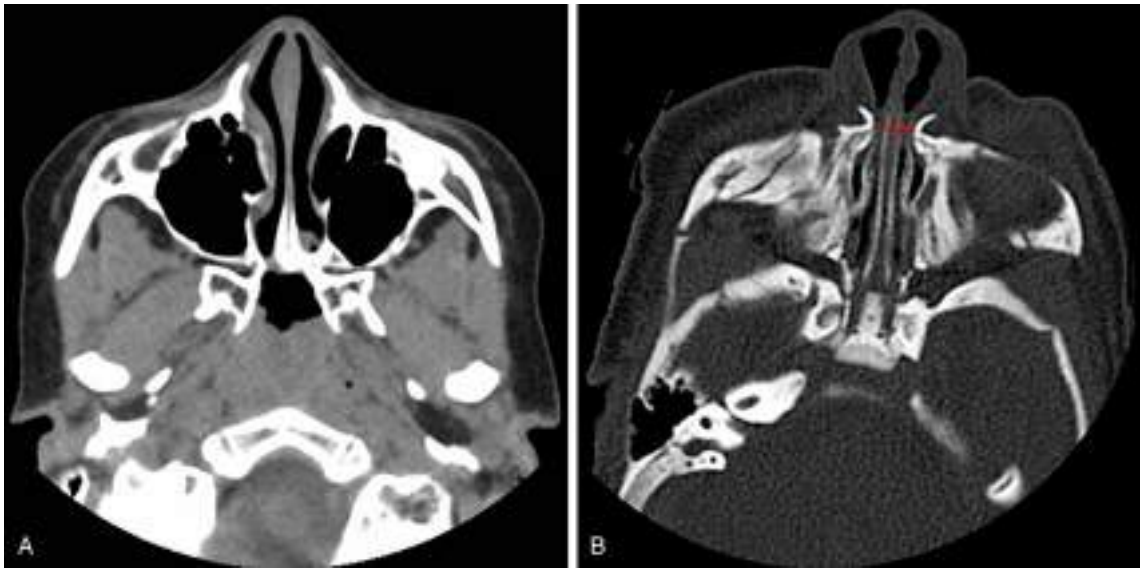

FIG. 189.1 **A,** Axial computed tomography (CT) scan of choanal atresia: bony left, membranous on right. **B,** Axial CT scan of pyriform aperture stenosis: 6 mm width measured.

2. MRI is used to further evaluate the patient for intracranial pathology. Holoprosencephaly spectrum can present with PAS and a central incisor. Evaluation for other neurologic congenital anomalies.

3. Electrocardiogram (EKG)/Echo evaluates for cardiac anomalies

Indications

1. Respiratory distress in the newborn

2. Inability to feed

3. Persistent nasal obstruction or sinusitis

4. Prolonged mechanical ventilation

Contraindications

1. Severe medical comorbidities

2. PAS - Improvement with medical management alone

Preoperative Preparation

1. Maximize oral airway—McGovern nipple, oral tracheal intubation, tracheostomy

2. Preoperative medical management: topical decongestants (oxymetazoline), nasal steroid sprays, saline spray

3. Preoperative CT to confirm diagnosis and evaluate length of nasal cavity/nasopharynx. Help to identify problem areas that will need dilation/drilling

4. Preoperative MRI to evaluate for holoprosencephaly in PAS with central incisor

5. EKG/echocardiogram—evaluate for cardiac anomalies

Operative Period

Anesthesia

General anesthesia with oral tracheal intubation for protection of the airway due to bleeding from the nasal cavity and nasopharynx

Positioning

Supine: The patient is positioned with the head turned slightly toward the surgeon. No shoulder roll needed.

Perioperative Antibiotic Prophylaxis

Antibiotic coverage against upper airway pathogens is recommended as a single intraoperative dose: Unasyn or clindamycin

Monitoring

No somatosensory evoked potential (SSEP) or electromyography (EMG) required

Instruments and Equipment to Have Available

1. Endoscopic sinus surgery instrument set
2. Urethral sound dilators
3. Hager cervical dilators
4. High-speed drill
5. Microdebrider with diamond drill bit
6. Endotracheal tubes (ETTs) available for stenting if required
7. Endoscopic bipolar cautery

Key Anatomic Landmarks

1. Pyriform aperture: narrowest segment of the nasal cavity
2. Vomer of septum
3. Pterygoid plates
4. Nasopharynx
5. Location of bilateral greater palatine artery in lateral palate

Prerequisite Skills

Endoscopic sinus surgery skill set: ability to operate endoscopically with drill, back biter, microdebrider

Operative Risks

1. Injury to sphenopalatine artery and posterior nasal septal artery leading to hemorrhage
2. Inability to control bleeding
3. Injury to nasal mucosa leading to scarring and contraction

4. Inadequate opening of the nasal airway leading to failed extubation and persistent obstruction

5. Injury to the skull base (possible cerebrospinal fluid (CSF) leak) due to incorrect use of dilators

Surgical Technique

1. Choanal atresia repair

   a. Endoscopic technique

   - Afrin soaked pledgets placed in both nasal cavities; Inject 0.5% lidocaine with 1:200,000 epinephrine into posterior septum, lateral wall, and atretic plate
   - Patient suspended using a Dingman Mouth Retractor
   - A 120-degree rigid endoscope is placed in a palate retractor to provide direct endoscopic view of the posterior choana (Fig. 189.2A)
   - A 0-degree rigid endoscope is advanced into the nasal cavity to examine the atretic plate
   - Urethral sounds (starting at 8 to 10 French) are then advanced through the nasal cavity to puncture the atretic plate under direct visualization with the endoscope. Pressure directed inferomedially along atretic plate (Fig. 189.2B)
   - Anterior mucosal flaps can be created to preserve mucosa over the atretic plate (will help prevent circumference scarring). A sickle knife can be used to incise the mucosa, and then a Cottle elevator is used to elevate the mucosa (Fig. 189.3A and B). Some surgeons prefer to create a small posterior nasoseptal flap to protect the mucosa over the posterior choana. We do not find this technique to be useful in the neonate population due to limited space and a small nasal cavity to protect the nasal flap while repairing the atresia.
   - If the bony atresia is too thick to puncture with the urethral sounds, then a curved microdebrider diamond drill can be carefully inserted into the nasal cavity and used to create an opening in the posterior choana. Drilling inferiorly and medially is

the safest location to start the atresia opening (Fig. 189.4A).

- Once an opening has been created in the atresia plate, it is then progressively enlarged using larger urethral sounds.
- Next, a 2.7-mm endoscope is advanced into the nasopharynx to visualize the vomer
- A backbiter is then used to remove the posterior aspect of the hypertrophied vomer.
- A microdebrider drill is then used to remove the additional bony vomer
- Additional drilling of the lateral pterygoid plate/posterolateral sphenopalatine wall may be required to achieve an adequate opening
- The mucosal flaps are then repositioned and an attempt should be made to cover any exposed bone

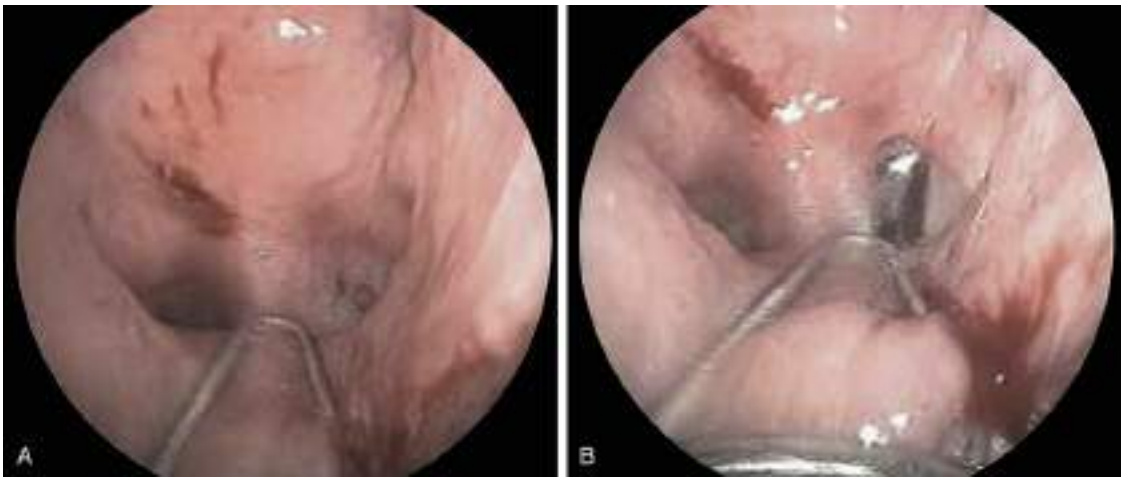

FIG. 189.2 **A,** Endoscopic view of nasopharynx/choanal atresia. **B,** Dilation with urethral sounds through atretic plate.

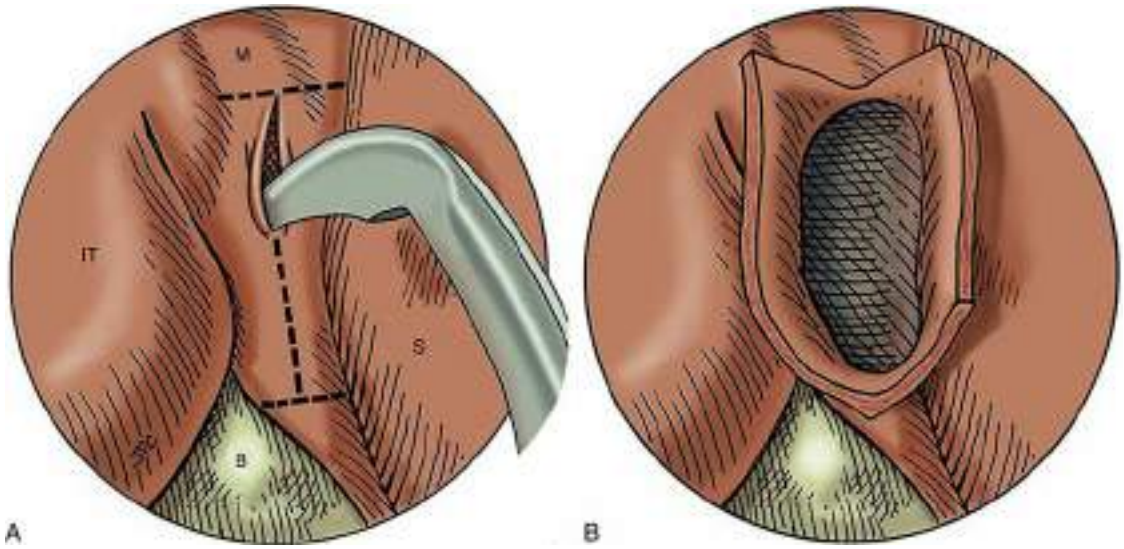

FIG. 189.3 **A,** Endonasal view of mucosal flap creation. Sickle knife used to incise mucosa. *B*, Bone; *IT*, inferior turbinate; *M*, mucosa; *S*, septum. **B,** Cottle elevator used to retract mucosa.

- Hemostasis is achieved with bipolar or suction cautery.
- Nasal cavity and nasopharynx are copiously irrigated with saline to remove all mucous, bone, and debris (Fig. 189.4B).
- Oxymetazoline placed in the nose bilaterally
- Patient extubated and taken to the neonatal intensive care unit (NICU) for postoperative monitoring

Note: Stent Placement: The surgeon may choose to place a nasal stent. A 3.5 mm ETT is cut so that the milled distal edge sits above the palate and the cut edge sites in the vestibule of the nose. One tube is placed in each side of the nose. A small piece of silastic can be placed on both sides of the caudal septum and then the stent is secured through the ETT and silastic pieces using a 4-0 nylon suture. The silastic protects the septum from pressure erosion. The nursing team is then taught to lift the tip of the nostril slightly to then insert the suction catheter through the endotracheal tube lumen. Some authors suggest using an oral-RAE right angle endotracheal tube, because it has a more natural downward curve that follows the nasal curvature of the nose. The timing of stent removal varies. It can range from 5 to 42 days. Most surgeons remove the stents within 7 to 21 days.

Many surgeons choose not to use stents due to the secondary damage they may create. They can damage the nasal mucosa, which then leads to granulation tissue, scarring, crusting, and impaired healing. This all leads to decreased nasal airway patency and possible revision surgery. Other complications such as alar injury, vestibular stenosis, and stent blockage can all occur. A recent meta-analysis[1] showed that success rates were similar with or without nasal stenting but that stents have more complications.

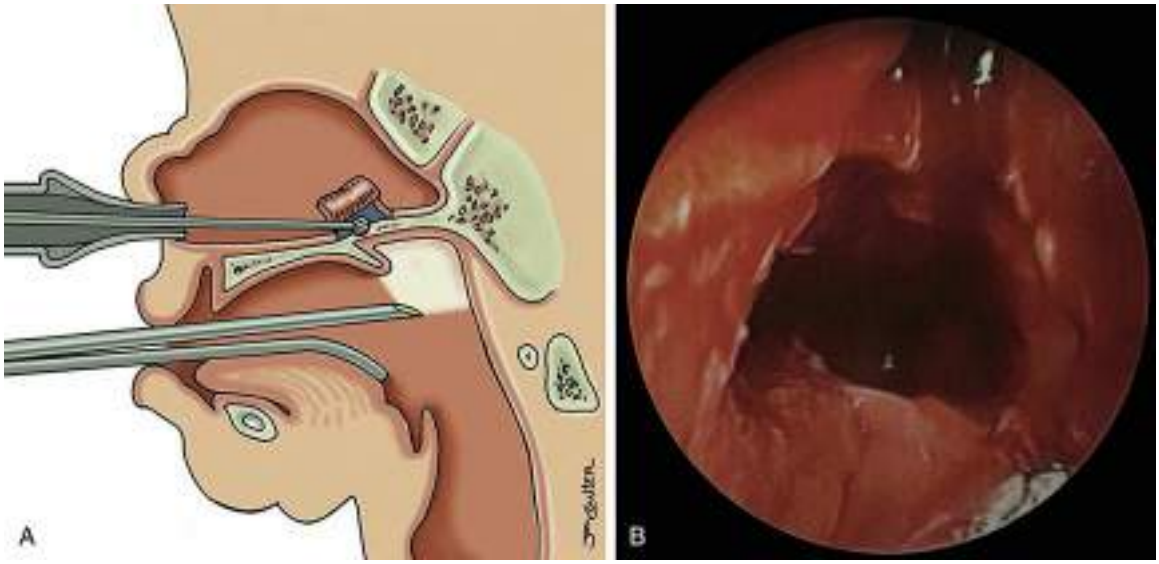

FIG. 189.4 **A,** Transnasal drilling of atretic plate under direct visualization through the endoscope. **B,** Transnasal endoscopic view of the nasopharynx immediately post operation.

b. Transpalatal Technique: indicated when the bony atretic plate is too thick to be punctured with a urethral sound or nasal stenosis does not allow the use of the endoscope within the nasal cavity

- Dingman mouth retractor placed and oral cavity suspended
- Palate injected with 0.5% lidocaine with 1:200,000 epinephrine
- Midline incision made through mucoperiosteum to create a "U" shaped mucosal flap based on the greater palatine vessels
- Mucoperiosteum undermined with Cottle elevator to the junction of the hard and soft palate.
- Care should be taken to preserve the greater palatine arteries—

ligating both arteries will lead to necrosis/poor wound healing due to loss of blood supply to the soft palate

- Muscular aponeurosis and nasopharyngeal mucosa of soft palate is incised transversely
- Palate is retracted posteriorly and superiorly towards the nasopharynx
- Bone of the posterior 1/3 of the hard palate is removed with a rongeur until nasal mucosa can be identified
- Bony atresia plate and posterior 1/3 of the vomer is removed with a rongeur or a curette (Fig. 189.5A and B)
- Preserve nasal mucosal flap to prevent stenosis
- Performed under direct visualization; Can use laryngeal mirror to visualize the atretic plate
- Nasal stents placed bilaterally and sutured to the septum
- Palatal flap is returned to midline anatomic position and closed with 3-0 silk

Note: The transpalatal technique is not considered first line therapy since the widespread use of the endoscopic technique. It has a risk of fistula development, growth retardation of the palate/midface growth, flap necrosis, and a 50% risk of crossbite deformity. High arched palate deformity and need for orthodontic treatment is also seen in this surgical group. It is also associated with longer hospitalization and increased blood loss. It is often only recommended in patients >5 years of age after adequate growth of the palate has occurred.

2. PAS repair

1. Sublabial drill out procedure

- Nasal endoscopy is performed to evaluate the level of nasal obstruction
- The sublabial region is injected with 0.5% lidocaine with 1:200,000 epinephrine
- A needle tip bovie is then used to make a sublabial incision and release of the upper lip frenulum

- The incision is carried down through the bone and then the soft tissue over the maxilla is carefully elevated using a Freer elevator. The soft tissue is elevated superiorly over the nasal spine and this exposes the pyriform aperture bilaterally (Fig. 189.5C)
- The nasal mucosa over the pyriform aperture is then carefully dissected away from the anterior wall of the pyriform aperture using blunt dissection
- An otologic drill with a 1 mm diamond drill burr is then used to reduce the anterior wall of the pyriform aperture.
- Care is taken to avoid entering or injuring the adjacent posterior nasolacrimal duct.
- Hemostasis is obtained with oxymetazoline-soaked Gelfoam
- The sublabial incision is then closed with absorbable sutures (3-0 vicryl and 4-0 chromic).
- A V-Y advancement can be used to close the frenulum site and provide improved length of the upper lip.
- The inferior turbinates should be outfractured using a 2 to 3 mm Hegar cervical dilator or small butter knife to maximize the width of the nasal cavity.
- Short term nasal stenting can be performed bilaterally to help keep the anterior nasal cavity patent during the immediate postoperative window (3 to 5 days)

2. Dilation

- Oxymetazoline soaked pledgets are placed in both nasal cavities
- Nasal endoscopy with a flexible or rigid endoscope is attempted to identify the areas of stenosis
- Hegar cervical dilators and then used to slowly dilate the pyriform aperture and out fracture the inferior turbinates to provide maximal space in the nasal cavity
- Start with 2 mm dilator—using adequate lubrication, it is advanced through the pyriform aperture and into the posterior nasal cavity. Care is taken not to advance the dilator past the nasopharynx and thus prevent any skull base damage

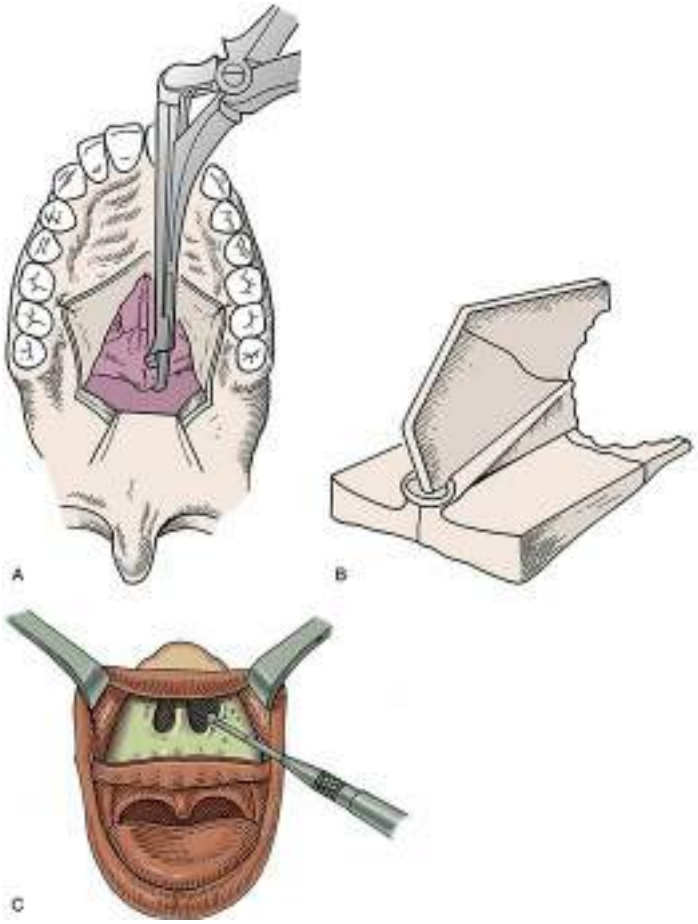

FIG. 189.5 **A,** A rongeur is used to remove the posterior aspect of the hard palate. **B,** Removal of a portion of the hard palate and vomer **C,** Sublabial drill-out procedure for pyriform aperture stenosis: Mucosa elevated and retracted away from pyriform aperture. A 1 mm diamond burr used to open the lateral wall of the pyriform aperture bilaterally.

- Continue bilateral dilation from 2 mm up to 4 to 5 mm dilators.
- The nasal cavity is then suctioned free of all mucous and debris and the endoscope is then advanced into the nasopharynx to confirm an adequate nasal airway
- Patients are then extubated and observed in the neonatal ICU.
- They are continued on oxymetazoline for 5 days, nasal saline drops, nasal corticosteroids, and frequent suctioning to ensure adequate airway

Common Errors in Technique

1. Inadequate width of choana opening leading to re-stenosis

2. Inadequate drilling/removal of the vomer or pterygoid plate can lead to inadequate choanal opening

3. Failure to address the inferior turbinates in PAS can lead to surgical failure

Postoperative Period

Postoperative Management

1. If stent is present: apply ciprodex topical drops three times daily
   a. Q2 hour suctioning
   b. Saline spray Q2 hours
   c. Removal of stent at 5 to 21 days
2. If no stent is present: apply ciprodex topical drops three times daily
   a. Q2 hour suctioning
   b. Saline spray Q2 hours
3. Repeat nasal endoscopy, debridement, and possible balloon or ureteral catheter dilation within the first 7 days to remove crusting, granulations, and early scarring is essential in the non-stent group.
4. Prophylactic anti-GERD management—key risk factor that must be treated
5. Endoscopic surveillance Q2–3 weeks—under anesthesia and then office endoscopy once tolerated.
6. Repeat dilation as needed (urethral sound dilators)
7. Monitor weight gain and respiratory status
8. Management of comorbid medical conditions (CHARGE)
9. Revision surgery is more frequently required in bony atresia compared

to mixed or membranous. Syndromic patients also have higher revision rates.

10. Mitomycin C has been used in the past to help prevent tissue regrowth and decrease revision rates. The literature does not currently support routine use of Mitomycin C. However, it should be considered in neonates.

Complications

1. Restenosis of choana: Risk factors: bilateral choanal atresia, pure bony atresia, associated congenital anomalies/syndromes, low body weight, age <10 days at surgical procedure all have higher rates of restenosis

2. Restenosis of pyriform aperture

3. Respiratory distress requiring intubation or other airway management

4. Poor weight gain/inability to feed

5. Nasal cavity stenosis

6. Long term—external nasal deformity

Alternative Management Plan

1. PAS: trial of medical management initially

2. Delayed surgical management of choanal atresia if other medical comorbidities do not allow immediate repair. Some patients may require tracheostomy for airway management until surgical repair.

Discussion

Evidence-Based Medicine Question

Is stenting required postoperatively after repair of bilateral choanal atresia?

A recent meta-analysis of the published literature concluded that: success rates were similar with and without the use of nasal stents. The

use of nasal stents can be associated with additional nasal complications. Also, the use of mitomycin C has not been proven as a success therapeutic adjunct in the postoperative management of choanal atresia.[1]

Editorial Comment

The evaluation, diagnosis, and treatment of choanal atresia and pyriform aperature stenosis are essential in all neonates who present with nasal obstruction. A complete evaluation including imaging and evaluation for comorbid conditions/syndromes is imperative to making appropriate management decisions for the patient. Timely relief of their nasal obstruction via noninvasive measures, dilation, or surgical repair can allow the neonate to grow and thrive. Close postoperative monitoring and consideration of other airway lesions will ensure of the best outcome for the patient.

Review Questions

1. What other syndrome is associated with choanal atresia?

   a. Pierre-Robin sequence

   b. **CHARGE syndrome**

   c. Hemifacial microsomia

   d. Beckwith-Wiedemann syndrome

2. What other anomalies can be associated with PAS:

   a. Lateral incisor syndrome

   b. Neural tube defects

   c. **Holoprosencephaly**

   d. Down syndrome

3. What is the normal width of the pyriform aperture at birth?

   a. 4 to 6 mm

b. 6 to 8 mm

c. 8 to 10 mm

d. **>11 mm**

4. What is the most common type of choanal atresia?

a. Membranous

b. Bony

c. **Mixed: Membranous-bony**

5. Mitomycin C has been shown to decrease scarring and decrease restenosis rates in choanal atresia repair?

a. True

b. **False**

Midline Nasal Masses

Todd M. Wine

Introduction

Midline nasal masses and nasolacrimal duct cysts (NLDC) are pathologies that afflict infants and children. The pathophysiology of the midline nasal masses and NLDC is distinct, and the treatment of each of them is just as distinct. When a child presents with a mass near or within the nose, congenital nasal masses and NLDC are in the differential diagnosis.

NLDC are intranasal cysts occurring in the inferior meatus. NLDC occur when a dacryocystocele expands into the nasal cavity under the inferior turbinate. A dacryocystocele forms when there is distal obstruction of the valve of Hasner and proximal dysfunction of the valve of Rosenmeuller.[1] NLDC should be ruled out in any infant presenting with a dacryocystocele, dacryocystitis, or nasal obstruction.

Congenital midline nasal masses consist of multiple pathologies, but for the purposes of this chapter, I will discuss nasal dermoid cyst, glioma, and encephalocele, due to their similarities in anomalous embryogenesis of the anterior neuropore.[2,3] These masses can present as an external or intranasal mass, and there can be intracranial extension. Other lesions included in the differential diagnoses are tumor, hemangioma, and vascular malformation.

Nasal dermoid cyst is a congenital cyst that can occur externally anywhere from the tip of the nose to the glabella and internally, along the nasal septum, prenasal space, at the level of the skull base near the foramen cecum and crista galli, and intracranially. This is the most common midline nasal mass, and theoretical embryogenesis is related to failure of dural and dermal precursors to detach from one another, resulting in dermal elements becoming trapped. Intracranial extension of

this mass occurs about 20% of the time.[4]

Glioma is also known as glial heterotopia. Gliomas are composed of neural tissue without direct intracranial connection, although they may connect to the intracranial space through a fibrous stalk.[2] These masses commonly occur near the glabella and can be midline or off midline externally. Externally, they can be smooth, noncompressible masses, but intranasally they can also occur as a pale mass.

Unlike nasal dermoid cysts or glial heterotopia, encephaloceles have a communication with the intracranial space. An encephalocele will contain cerebrospinal fluid, meninges, and neural tissue herniating through a defect in the skull base. This can result in an external or intranasal mass. Encephaloceles can occur through many different defects in the skull base. Frontonasal encephaloceles are those occurring via a defect in fonticulus frontalis, while nasoethmoidal encephaloceles protrude via the foramen cecum.[2] Other encephaloceles occur in various regions of the skull base.

Key Operative Learning Points

- Always assess the contralateral nasal cavity for an occult NLDC.
- Preoperative imaging is mandatory in the assessment of congenital nasal masses and allows for a more accurate surgical plan.
- A variety of approaches could be used in each mass encountered. Consider using the approach that best allows visualization, exposure, and minimization of morbidity. Sometimes a combination of approaches provides the best solution.
- Do not biopsy a midline nasal mass prior to imaging studies.

Preoperative Period

History

- When was the mass recognized? How long has it been present? Most midline nasal masses will be noticed at birth but not necessarily. External nasal masses can be more easily seen, but even external nasal

dermoid cysts can be present but escape notice by the parents. NLDC are located within the nasal cavity and will usually not present unless they obstruct the nasal cavity.

- What color is the mass?
- Is there any nasal obstruction or breathing problems?
- Is there difficulty feeding?
- Does the patient have epiphora, eyelid swelling, redness?
- Has there been any recent infection?
- Has there been any trauma to that area of the face?
- Is there an opening or pit in the skin? Has drainage from it been noticed?
- Is there any change to the mass induced by crying (i.e., increased intracranial pressure)?

Physical Examination

- NLDC
  - Facial examination: The facial examination will often be abnormal, especially if the infant is presenting with dacryocystitis. If there is no dacryocystitis, there can still be a mild abnormal swelling near the medial canthus of the eye.
  - Nasal examination: NLDC will be visualized in the inferior meatus. When it is associated with acute infection, the cyst can be more forceful and displace the inferior turbinate superiorly (Fig. 190.1).
  - Ocular examination: This is most important when there is an infected dacryocystocele. This can cause erythema and edema of the inferior eyelid, and a proper ophthalmologic examination is important to rule out other ocular pathology.
- Congenital nasal mass
  - Examination of the face: A mass in the face can often by missed by parents. It is important to look for a mass along the dorsum of the nose from the nasal tip to the glabella. Most often the mass will be in

the midline, but paramedian locations can also occur. Hypertelorism can also occur. Discoloration of the lesion is more consistent with a glioma. A positive Furstenberg sign occurs if crying or occlusion of the jugular vein results in enlargement of the mass. This suggests that there is an intracranial communication related to the mass. The presence of a pit or sinus in the skin, with or without a hair, suggests a nasal dermoid cyst is suspected (Fig. 190.2A and B).

- Examination of the nose: It is always important to make sure that there is no evidence of an intracranial portion of the mass. Some masses can be solely intranasal, some combined intranasal and extranasal, and some entirely extranasal.
- Examination of the oral cavity: In very large midline nasal masses, there can be extension of the mass into the oral cavity. Examine for a cleft in the hard or soft palate, as it could be an associated defect of the midline.
- Examination of the eyes: This is usually normal, but assessment for hypertelorism is important.

Imaging

- NLDC
  - Imaging studies are not warranted for most presentations of NLDC, as there will be a cyst visualized in the middle meatus in a patient presenting with nasal obstruction or dacryocystitis. If the presentation seems atypical, however, imaging with facial computed tomography (CT) or magnetic resonance imaging (MRI) is recommended.

FIG. 190.1 Intranasal endoscopy demonstrating a large nasolacrimal duct cyst *(arrow)* in the inferior meatus causing superior-medial displacement of the inferior turbinate *(asterisk)*.

- Midline nasal mass
  - Plain films: not indicated
  - Ultrasound: not indicated
  - Computed tomography scan of the face and brain: Computed tomography (CT) highlights the ossified bony anatomy and can also depict the mass. The anterior midline skull base is not ossified at birth, and interpretation of the integrity of the skull base requires knowledge of the normal ossification pattern and timing of the anterior skull base (Fig. 190.3).[2]
  - Magnetic resonance imaging of the face and brain: Magnetic resonance imaging (MRI) is the imaging modality of choice for frontonasal congenital masses. MRI differentiates tissue type better than CT, can more likely identify a tract, and can assess for concomitant intracranial anomalies.[2]

Indications

- NLDC: Once diagnosed, surgery is recommended.
- Nasal dermoid cyst: nasal mass that causes deformity and may carry the risk of meningitis if there is an intracranial connection
- Nasal glioma: nasal mass
- Nasal encephalocele: nasal mass carrying the risk of meningitis and progressive craniofacial deformity

Contraindications

- Severe medical comorbidities that prevent general anesthesia
- Active infection with/without meningitis for glioma, dermoid, or encephalocele

Preoperative Preparation

- NLDC: Consultation with an Ophthalmologist is recommended. This will allow concurrent probing of the lacrimal duct and the placement and management of lacrimal duct stents.
- Midline nasal mass: Preoperative imaging is mandatory, and this allows proper surgical planning. The preoperative imaging guides the approach and the extent of surgery. As such, consider consultation with neurosurgery and craniofacial surgery as indicated.

FIG. 190.2 **A,** Preoperative photograph of child with

active drainage from the midline sinus tract of a nasal dermoid cyst. **B,** Small punctum noted near nasal tip *(arrow)*.

Operative Period

Anesthesia

- NLDC: General endotracheal anesthesia
- Midline nasal mass: General endotracheal anesthesia

Positioning

- Patients are placed in the supine position.

Perioperative Antibiotic Prophylaxis

- NLDC: not indicated
- Midline nasal mass: If there is an external skin incision only and the case remains a clean procedure (not clean-contaminated), antibiotic prophylaxis is not necessary. The risk of clean surgeries in the head and neck (particularly if not related to cancers) having a surgical wound infection is less than 1%.[5] If there is an external incision only and craniotomy, cefazolin or clindamycin is recommended.
- Midline nasal mass with intracranial extension: If exposure to intranasal/sinus cavity and craniotomy, prophylaxis is recommended. Ampicillin-sulbactam or cefazolin (or cefuroxime) plus metronidazole.[5] Clindamycin is an alternative for the aerobic and anaerobic portion of this coverage in those with β-lactam allergy.

Monitoring

- NLDC: No monitoring is needed.
- Midline nasal mass without intracranial involvement: No monitoring is necessary.

- Midline nasal mass with intracranial involvement: No monitoring is necessary.

FIG. 190.3 Computed tomography scan of the skull base in a child with a congenital nasal mass. *Arrow* points to the region of the anterior skull base that is not ossified.

Instruments and Equipment to Have Available

- NLDC:
  - Pediatric sinus or otology instrument set
  - Microdébrider equipped with 3 mm sinus microdébrider or an inferior turbinate blade
  - Lacrimal duct probes: Probing the lacrimal duct can confirm the location of the cyst and aid in adequate removal of the cyst. It is more important to consider this in cases of dacryocystitis. This portion of the surgery will often be performed by an Ophthalmologist.
  - Nasolacrimal duct stent: This may be recommended by the Ophthalmologist.

- Nasal dermoid cyst without intracranial extension or nasal glioma on the surface of face/nose:
  - Facial plastics instruments are necessary if an external incision is required. This would include an open septorhinoplasty set.
  - Endoscopic sinus instruments including zero- and 30-degree endoscopes and sinus instruments
  - Image guidance systems could also be considered, depending on the case.
- Nasal dermoid cyst with intracranial extension:
  - Facial plastic surgery set
- Nasal encephalocele:
  - Facial plastics instruments are necessary for the external approach.
  - If the encephalocele is large, and an osteotomy is required, then a sagittal saw, piezoelectric system is needed.
  - If a craniotomy is required, a neurosurgical set, including a saw and plating system, is necessary.
- Intranasal midline mass without intracranial extension:
  - Rhinoplasty set
  - Endoscopic sinus set

Key Anatomic Landmarks

- NLDC:
  - Inferior meatus: The nasolacrimal duct drains into the space between the inferior turbinate and the lateral nasal wall. An NLDC will often fill this space and will herniate from this space into the nasal cavity and often elevate the inferior turbinate superiorly (Fig. 190.1). An NLDC can cause varying degrees of nasal obstruction.
  - Valve of Rosenmueller: This is the proximal valve between the canaliculi and the lacrimal sac. This valve is dysfunctional in dacryocystocele but not in routine nasolacrimal duct obstruction commonly seen in newborns.

- Valve of Hasner: This is the distal valve of the nasolacrimal duct. Obstruction at the level of this valve causes engorgement of the nasolacrimal duct and sac and is the cause of nasolacrimal duct obstruction often seen in infancy. If this occurs with dysfunction of the valve of Rosenmueller, a dacryocystocele can form.[1]

- Midline nasal mass with intracranial extension:
  - Prenasal space: This is a funnel-shaped dural projection in the midline. It extends from the crista galli and nasal cartilage to the posterior aspect of the nasal bones (Fig. 190.4).[2] This space is often traversed by a fibrous tract that extends to the foramen cecum or intracranially through the foramen cecum.
  - Foramen cecum: This is an embryologic communication that extends from the intracranial region into the prenasal space to what becomes the skin over the dorsum of the nose. The mass can extend through this region (Fig. 190.5).
  - Fonticulus frontalis: Transient fontanelle between the inferior frontal bone and the nasal bones. This is an embryologic space that should become obliterated, but in some cases of a nasal mass, an intracranial connection can occur through this space (Fig. 190.6A and B).

FIG. 190.4 Sagittal computed tomography scan of the

face highlighting the prenasal space highlighted by an *arrowhead*.

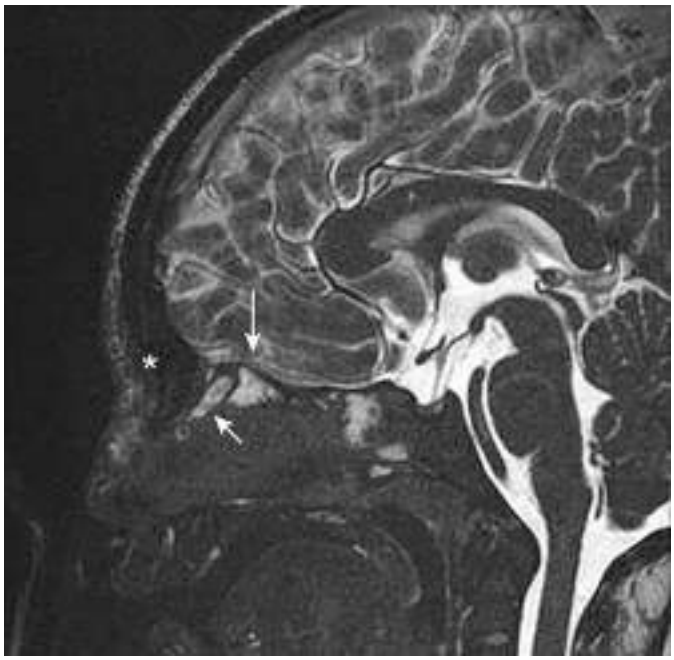

FIG. 190.5 Sagittal magnetic resonance imaging of the face demonstrating the extension of the mass *(small arrow)* through the foramen cecum. *Large arrow* points to the crista galli. The nasal bones are represented by the *asterisk*.

- Nasal bones: In some nasal masses, the intracranial tract will extend through the prenasal space under the nasal bones heading toward the foramen cecum. Following the tract to the intracranial space may require mobilization of the nasal bone to allow better visualization.
- Crista galli: A bifid crista galli can signify that there is a nasal dermoid cyst present at that location.

- Nasal glioma: Similar to midline nasal mass with a possible tract extending to the foramen cecum or the fonticulus frontalis. The anatomy will be varied based on the particular mass.
- Nasal encephalocele: The importance of the anatomic landmarks will vary based on the location of the defect in the skull base associated with the encephalocele, but the anatomic concepts listed previously

apply. Encephaloceles are defined by the location of the defect in the skull base. Frontonasal encephaloceles will extend through the fonticulus frontalis into the region of the glabella, while frontoethmoidal encephaloceles occur through the foramen cecum and will extend into the prenasal space and then present on the dorsum of the nose or intranasally.[2]

Prerequisite Skills

- NLDC: Intranasal examination and surgery. Endoscopic skills are helpful.
- Midline nasal masses: The skills necessary are varied and are dependent on the approach used to remove the mass.
  - Endoscopic surgery skills are necessary for any intranasal portion of the mass. Endoscopic surgery skills are also helpful when dissecting in the prenasal space or assessing the facial side of the skull base.
  - Open rhinoplasty and lateral rhinotomy skills: Open rhinoplasty is a good surgical approach to masses of the nose and is particularly well suited for masses without an external sinus and for masses that are more distal in their location on the nose. Lateral rhinotomy can be helpful in certain circumstances for similar reasons.
  - Bifrontal craniotomy: This is essential for the intracranial portion of a nasal dermoid cyst or for encephaloceles.
  - Skull base reconstruction. This is always necessary when there is a defect of the skull base, which is present with every encephalocele and in those nasal dermoid cysts with intracranial extension. Reconstruction of the skull base depends on the technique used to extirpate the intracranial portion of the mass.
  - Craniofacial reconstruction: In more severe cases of frontonasal encephalocele, correction of the midline defect may require more extensive craniofacial procedures and manipulation of the anterior craniofacial skeleton.

Operative Risks

- NLDC:
    a. Recurrence, injury to nasolacrimal duct, scar formation
- Midline nasal mass: recurrence, scar, infection, bleeding, anosmia, cerebrospinal fluid leak, meningitis, encephalitis, encephalomalacia, and stroke

Surgical Technique

The surgical technique used to treat NLDC and other midline nasal masses is dissimilar. Most NLDC are addressed in a routine manner. The other congenital nasal masses will require a more individualized approach to their surgical treatment based on physical examination and preoperative imaging. The surgical approaches include transcutaneous alone, intranasal alone, combined transcutaneous and intracranial, and combined transcutaneous/intranasal and intracranial. Despite having numerous variations, there are key principles that can help frame the understanding of these varied procedures.

- NLDC: The surgical treatment of NLDC features marsupialization of the NLDC.[1,6]
    - Topical vasoconstriction with oxymetazoline is performed. This allows mucosal decongestion and better visualization of the anatomy and pathology of the nasal cavity.

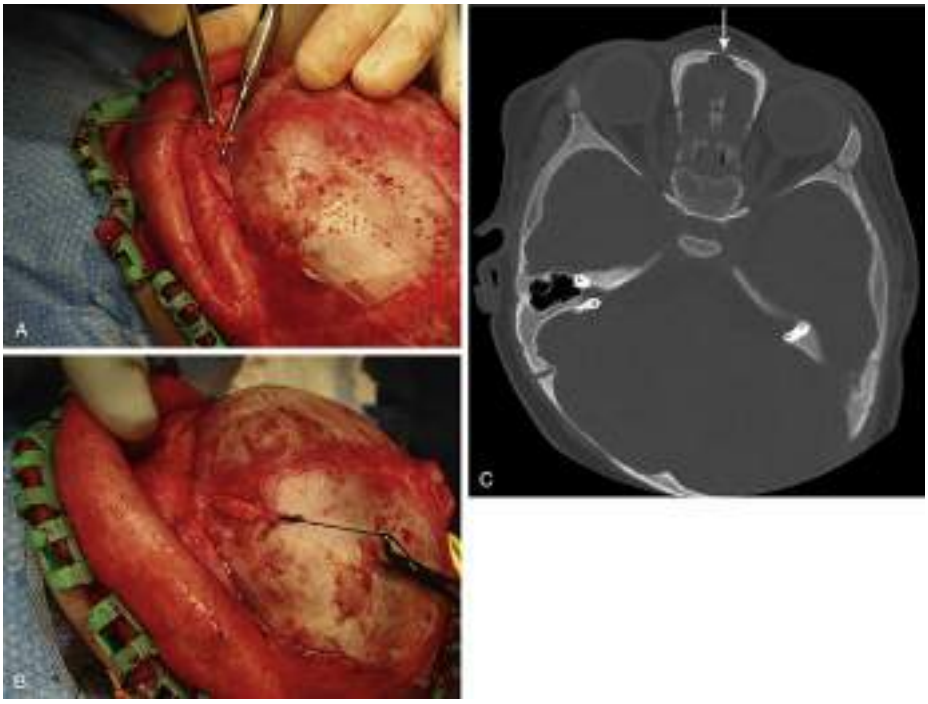

FIG. 190.6 **A,** Photograph of a dermoid cyst involving the skin and dermis and traversing through a defect located at the fonticulus frontalis. **B,** Photograph of a dermoid cyst with a suture tied to the distal aspect. **C,** Computed tomography scan of the face demonstrating the defect *(arrow)*.

- The nasal cavities are examined using bilateral nasal endoscopy, which allows assessment of the NLDC. Even in the setting of unilateral NLDC, contralateral nasal endoscopy is recommended to evaluate for asymptomatic NLDC.
- Marsupialization of the NLDC is performed. This can be carried out with 45-degree up Blakesley forceps, small cup forceps, or a microdébrider with 2-mm turbinate blade or smallest sinus blade (Video 190.1).
- Probing of the lacrimal duct. This is performed by the ophthalmologist before, during, and/or after marsupialization of the NLDC. It should always be performed following marsupialization, as it can allow identification of tissue that will benefit from further débridement (see Video 190.1).
- Irrigation of the nasolacrimal duct
- Placement of the nasolacrimal duct stent is determined by the ophthalmologist (Fig. 190.7).

- Nasal dermoid cyst with a cutaneous sinus tract:
  - A fusiform incision is placed around the sinus. Alternatively, consideration can be given to using a smaller incision around the fistula (to minimize the scar on the nasal dorsum) and dissecting the dermoid cyst through an open rhinoplasty or lateral rhinotomy approach. Inject the planned incision site with lidocaine with epinephrine.
  - Through this incision, elevate skin flaps allowing dissection of the underlying dermoid cyst. Take care to avoid rupturing the cyst wall.
  - Dissection of the cyst. If there is no evidence of a deeper tract or intracranial tract, remove the cyst in its entirety by circumferential dissection.
  - Irrigate and close the incision using standard facial plastic wound techniques for skin closure.
- Nasal dermoid cyst with cutaneous sinus and deeper tract extending toward the skull base or intracranially:
  - Complete the steps listed previously.
  - At the deeper aspect, dissect the tract toward the skull base. Preoperative imaging may allow planning of the dissection to occur in the direction of the foramen cecum or the fonticulus frontalis (Fig. 190.6A).
    1) If the dissection takes place in the prenasal space, disarticulation of the nasal bones will allow better exposure of the tract toward the foramen cecum. The use of endoscopes can also be helpful in this situation, since the external view is limited. Once the skull base is reached, the external component is excised. If a residual tract extends intracranially, proceed with the operative plan for the intracranial component. Consider frozen section pathology analysis of residual tissue at/on the skull base. This provides more certainty that there is no further intracranial portion.

FIG. 190.7 Endoscopic placement of the stent following removal of a nasolacrimal duct cyst.

FIG. 190.8 Nonlinear bicoronal incision is used.

2) If the dissection of the tract extends toward the fonticulus frontalis, follow the tract toward the defect in the frontal bones, place a suture ligature around the tract as it enters the intracranial space, and excise the external cyst and tract.

- Intracranial component: The intracranial component has classically been addressed through a bifrontal craniotomy performed by a neurosurgeon. A nonlinear incision (Fig. 190.8) should be used for a

bifrontal craniotomy incision as the resultant scar and alopecia will be less noticeable. The frontal lobes are able to be retracted to allow visualization of the cranial defect (Fig. 190.9). Once the neurosurgeon removes the intracranial portion, inspect the communication from the intracranial space and external wound for evidence of any residual cyst. Thoroughly irrigate the wound. Repair of the skull base is performed as indicated.

1) If an intracranial portion exists, the chief alternatives to frontal craniotomy are more direct approaches to the skull base. These include endoscopic, direct excision, subfrontal craniotomy, and direct craniotomy through a small window osteotomy.[7-10] Use of these approaches requires the ability to address CSF leak, repair dural defects, and reconstruct skull base defects via this extended external approach. The primary advantages to these approaches are potentially less neurologic morbidity and avoidance of a large bifrontal craniotomy incision.

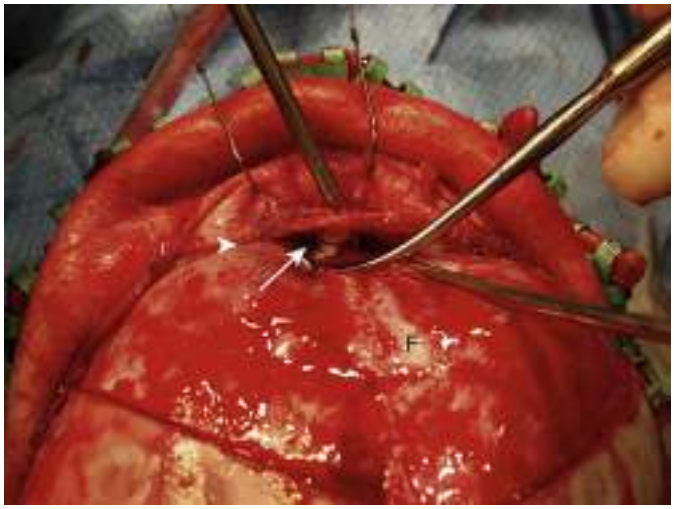

FIG. 190.9 The intracranial portion of the dissection is shown with retraction of the frontal lobes. *Arrow* points to dermoid extending through the frontal defect at fonticulus frontalis. *Arrowhead* points to the margin of the frontal bone osteotomy. *F* indicates the frontal lobe.

- Close the external portion of the incision using standard facial plastic wound closure techniques.

- Glioma in an external location:
  - Plan the excision of the mass to occur using an open rhinoplasty, lateral rhinotomy, or direct incision over or near the lesion. Consider the cosmetic outcome of the scar and the possibilities of complete excision of the mass when selecting a technique. Using an incision that is not along the nasal dorsum helps adhere to the subunit principles of external nasal incisions. If feasible, consider an endoscopic approach.
  - Circumferential dissection of the glioma and the tract is performed, and the specimen is removed en bloc.
  - Close the wound using standard facial plastic wound closure techniques.
- Nasal encephalocele:
  - See the previous section on intracranial components. With encephaloceles, there can be a much larger bony skull base defect and more significant effect of the mass on the craniofacial skeleton. As such, removal of the encephalocele is only part of the procedure. Should a very large encephalocele be present, craniofacial reconstruction is part of the procedure.
- Intranasal midline nasal mass:
  - Endoscopic intranasal techniques, open rhinoplasty, or midface degloving techniques may all be appropriate. With the advancement of endoscopic anterior skull base surgery, consider the endoscopic approach to intranasal congenital midline nasal masses.
    1) If there is an intracranial portion, this can be addressed with endoscopic techniques or standard bicoronal craniotomy.

Common Errors in Technique

- NLDC:
  - Failure to inspect an asymptomatic contralateral side could lead to a symptomatic NLDC that could have been addressed under the same general anesthetic.
  - Failure to adequately marsupialize the cyst

- Midline nasal masses:
  - Inadequate exposure of the tract extending to the skull base. This may compromise dissection of the tract. If dissecting in the prenasal space, better exposure can be achieved by disarticulating the nasal bones. Consider the use of nasal endoscopes when following the tract in order to aid with exposure.
  - Dissection of the tract through an external incision that is too small can lead to inadvertent cutaneous tear of the skin of the nasal dorsum, converting a linear scar to an irregular or T-shaped scar.

Postoperative Period

Postoperative Management

- NLDC:
  - Use saline drops to help prevent crusting in the nasal cavity. This will help the infant continue to have good nasal respiration.
  - Continue antibiotics if there was an infected dacryocystocele.
  - Postoperative pain is not severe, and usually acetaminophen is sufficient. Narcotics are not usually necessary.
- Midline nasal mass:
  - Recommend local wound care depending on the wound closure technique.
  - Control pain using acetaminophen as first-line therapy. Further pain control should be using narcotic at low doses, unless the infant is older than 6 months and ibuprofen can be given more safely.

Complications

- NLDC:
  - Epistaxis that can quite easily be controlled by topical decongestion and/or oxymetazoline or phenylephrine- soaked nasal pledgets if needed

- Recurrence of cystic intranasal swelling
- Injury to the nasolacrimal duct causing epiphora

- Midline nasal masses:
  - Hemorrhage. This could occur externally, intranasally, or intracranially.
  - Wound infection
  - Widened scar
  - Cerebrospinal fluid leak
  - Meningitis
  - Stroke
  - Encephalomalacia
  - Recurrence

Alternative Management Plan

- NLDC: If the infant is tolerating feedings, breathing well, and without acute dacryocystitis, it may be tempting to observe for resolution of the cyst. This is unlikely to treat the cyst and would likely delay the recommended marsupialization.
- Midline nasal mass with intracranial communication. Alternatives to surgical excision of a midline nasal mass depend on the nature of the mass. If there is an intracranial component to the mass, the only realistic alternative to proceeding with surgery as soon as possible is to educate the family that delaying surgical repair places their child at risk for meningitis and its concomitant morbidities and potential for mortality.
- Midline nasal mass without intracranial extension: Medical observation is reasonable, assuming there is no significant risk for intracranial infection. This occurs most commonly after initial diagnosis and workup, particularly if the infant is very young. In this age group, waiting until the patient is 18–24 months old may help decrease some of the perioperative risks. Waiting does carry the potential risk of further enlargement of the mass and disfigurement of the native

craniofacial structures.

Discussion

Evidence-Based Medicine Question

What is the recommended first-line antimicrobial prophylaxis for excision of a nasal dermoid without intracranial or intranasal extension?

Surgical antibiotic prophylaxis has guidelines outlining proper usage.[5] The guidelines account for the location of the surgery and the classification of the wound created. Excising a midline nasal mass could be either a clean wound or a clean-contaminated wound. If the wound breaches the nasal epithelium, the wound classification would be clean-contaminated and comparable to rhinoplasty or septoplasty in terms of risk of infection. If there is intracranial extension of the mass, the wound classification does not change, but the location of the tissue includes the intracranial space, and thus new consideration is required.

Excising a dermoid cyst or glioma (neither with intranasal or intracranial extension), surgical antibiotic prophylaxis is not needed, as it is a clean wound within the head and neck.[5] In the head and neck, a clean wound has a very low rate of infection (<1%).

If the midline nasal mass extends to involve the nasal mucosa, the use of prophylaxis is harder to determine. Traditionally, antibiotics are given for clean-contaminated procedures of the head and neck, but they are not routinely given for septoplasty and tonsillectomy. Since no literature specifically addresses midline nasal masses, individual judgment is required. First-line therapy for clean-contaminated wounds in the head and neck are cefazolin plus metronidazole or ampicillin-sulbactam.

If the mass extends into the intracranial space, antibiotic prophylaxis is unequivocally recommended.[5] Typically, prophylaxis for a craniotomy involves coverage of typical skin flora (i.e., cefazolin). If the wound is clean-contaminated due to the nasal cavity, it is reasonable to broaden the coverage to include gram-positive and gram-negative bacteria (cefazolin + metronidazole or ampicillin-sulbactam).[5]

Editorial Comment

In evaluating a child with a midline nasal mass, one must avoid biopsy of the mass prior to imaging studies, which demonstrates a lack of intracranial extension. CT scan and MRI are complementary, and thus obtaining both studies is often ideal for evaluation. There have been significant improvements in surgical instruments, including endoscopes, powered instrumentation, and image guidance, which have facilitated surgical excision of these lesions. Many of the midline masses can be excised without an external scar, by using the external rhinoplasty or facial degloving approach and endoscopes. Close collaboration with our neurosurgical colleagues is crucial in addressing the intracranial extensions of these lesions. A surgeon must keep in mind that the first excision offers the best chance at a complete excision. Finally, meticulous attention is needed in reconstructing the skull base in order to prevent serious postoperative complications.

Review Questions

1. Which statement best describes the underlying valvular malfunction that is necessary to create an NLDC?

   a. **The distal valve of Hasner is obstructed, and the proximal valve of Rosenmueller is dysfunctional often creating a functional or mechanical obstruction**

   b. The distal valve of Hasner is obstructed, and the proximal valve of Rosenmueller is functioning normally.

   c. The valve of Hasner is normal, and the proximal valve of Rosenmueller has a functional obstruction.

   d. Both valves are normal, and the cyst occurs due to an anatomic abnormality of the inferior meatus and inferior turbinate.

2. What is the proper terminology referring to the physical examination finding that the midline nasal mass does not increase in size with internal jugular vein occlusion or crying?

a. Positive Tullio phenomenon

b. Negative Hennebert sign

c. Positive Histelberger sign

d. **Negative Furstenberg sign**

3. What imaging study is indicated for a patient presenting with dacryocystitis and evidence of a cyst in the inferior meatus?

a. MRI face

b. CT face

c. Combine CT and MRI face

d. **No imaging study is indicated**

4. What is the name of the space that is directly posterior to the nasal bones, through which a tract can extend from the dorsum of the nose to the foramen cecum?

a. Fonticulus frontalis

b. Cribriform plate

c. **Prenasal space**

d. Fovea ethmoidalis

5. In which of the following pathologies is frozen section analysis during the surgery potentially helpful?

a. Dissection of encephalocele

b. Dissection of glioma

c. **Dissection of tract of nasal dermoid cyst toward the skull base**

d. Marsupialization of the NLDC

Adenoidectomy

Kitirat Ungkanont

Introduction

The adenoid is a part of the Waldeyer's ring of lymphoid tissue, which consists of palatine tonsil, adenoid or pharyngeal tonsil, tubal (eustachian) tonsil, and lateral pharyngeal band. The adenoid is a single, lobulated lymphoid tissue located on the roof of the nasopharynx. The entire nasopharynx is lined by respiratory epithelium, which covers the adenoid and the eustachian tube to the tympanic cavity. There are variations in shape and size of the adenoid, which can occupy some part of the nasopharynx or fill the entire nasopharyngeal cavity and obstruct the view of the choanae. The adenoid is the lymphatic tissue without the afferent lymphatic channel. The efferent drainage is to the retropharyngeal lymph nodes to the upper deep cervical lymph nodes and posterior triangular lymph nodes.

Adenoid tissue consists mainly of lymphocytes. The percentage of adenoid lymphocytes is highest in children age 0 to 5 years (about 75%), and it decreases with time, with significant decrease in children after 10 years of age.[1] The subpopulations of lymphocytes are approximately 50% B cells and 30% T cells. The adenoid is considered to be the gatekeeper of the upper respiratory tract, performing both protective and immunologic function. The microorganisms entering the airway are presented as antigens to the adenoid. The lymphoid cells in the adenoid are then stimulated, resulting in continuous immunologic reactions. B cells are transformed into plasma cells that produce antibodies. T-helper cells stimulate B cells in the transforming process and cytotoxic T cells (CD8) kill antigen by releasing cytokines. The adenoid and the tonsils are involved in both local and systemic immunity. In addition, the adenoid is different from the tonsils in that it produces local mucosal antibody, secretory IgA, with the secretory component that does not exist in the

tonsil. Adenoid surface secretion contains antibody-secreting cells, which produce IgG and IgA against pathogenic bacteria. The function of the adenoid is active in children, but its role decreases in adolescence.

The adenoid is the reservoir of bacteria in the nasopharyngeal area, including *Streptococcus pneumoniae*, nontypable *Haemophilus influenzae*, and *Moraxella catarrhalis*, which are common pathogenic bacteria for otitis media and sinusitis. The location of the adenoid is in the vicinity of the Eustachian tube and the ostiomeatal complex so that the bacteria in the adenoid is the contributing factor for infections of the middle ear and sinuses. The bacterial load in the adenoid, particularly *H. influenzae*, stimulates the lymphoid cells, causing increased activity of the antigen-stimulated B lymphocyte and polyclonal B-cell proliferative response. Adenoid hypertrophy causes nasal obstruction and obstructive sleep disorders in children, when accompanied by tonsillar hypertrophy. Adenoidectomy is recommended in the guidelines for the treatment of pediatric otitis media with effusion (OME) and sinusitis, to eliminate the source of infection.[2,3] Adenoidectomy or adenotonsillectomy is recommended in hypertrophic adenoid for chronic infection, nasal obstruction, or obstructive sleep apnea (OSA) in children.

Key Learning Points

1. The adenoid is located on the roof of the nasopharynx, which is attached to the base of the skull under the sphenoid bone. The floor of the nasopharynx is the upper surface of the soft palate.

2. The anterior boundary of the nasopharynx is the choanae, which is a continuation from the nasal cavity. The posterior boundary of the nasopharynx is the pharyngeal wall, which consists of the mucosa, the pharyngobasilar fascia, and the superior constrictor muscle.

3. The *torus tubarius* is the nasopharyngeal end of the Eustachian tube, which opens into the lateral wall of the nasopharynx on both sides of the adenoid. The slit-like recess formed by the Eustachian tube and the concave upper border of the superior constrictor muscle is called the pharyngeal recess or the fossa of Rosenmùller. Hypertrophic adenoid can extend laterally, encroaching upon the torus tubarius, which is the nasopharyngeal prominence overlying the cartilage of the Eustachian tube, and care must be taken to avoid injury to the Eustachian tube while

removing the adenoid.

4. Bleeding from adenoidectomy is mostly raw surface bleeding. Hemostasis is achieved by electrocautery and nasopharyngeal packing with vasoconstrictors. The blood supply of the adenoid is from the ascending palatine branch of the facial artery, ascending pharyngeal artery, pharyngeal branch of the internal maxillary artery, and ascending cervical branch of the thyrocervical trunk. Venous drainage is through the pharyngeal plexus to the pterygoid plexus, facial vein, and internal jugular vein.

Preoperative Period

Adenoidectomy is a surgical procedure that is performed mostly in children. Adenoidectomy is usually done for the relief of nasal obstruction or elimination of the source of infection. According to the guidelines,[2,3] adenoidectomy is done in pediatric patients with OME, chronic sinusitis, or OSA. Each condition has its own indications for adenoidectomy, but there usually are overlapping conditions in the same patient since the pathogenesis of otitis media, sinusitis, and obstructive adenoid hypertrophy may originate from chronic infection of the adenoid. Sometimes one condition contributes to the timing of surgery for another condition. For example, in a child who reaches the indication for myringotomy for having middle ear fluid for more than 90 days, adenoidectomy should be done in the same setting if the child also has the problem of adenoid obstruction or chronic sinusitis. Performing adenoidectomy with myringotomy and ventilation tube insertion eliminates the source of infection for both conditions and decreases the need for multiple general anesthesias.

History

1. History of present illness

- Persistent middle ear effusion for more than 90 days
- Hearing loss
- Speech delay
- Chronic rhinorrhea

- Chronic cough
- Chronic nasal obstruction, snoring
- OSA
- Behavioral issues that may be the result of OSA: Daytime sleepiness, irritability or hyperactivity, nocturnal enuresis

2. Past medical history

- Allergic rhinitis
- Asthma
- Cardiac conditions that may be the complications of OSA: Pulmonary hypertension, right ventricular hypertrophy, cor pulmonale
- Previous surgery, abnormal bleeding during surgery, or family history of abnormal bleeding
- Medications: Anticoagulants, oral or intranasal steroids

Physical Examination

- Adenoid facies: Patients with long-standing nasal obstruction from adenoid hypertrophy may have the appearance of "adenoid facies," which is the result of chronic mouth breathing. Malocclusion, excessive showing of the upper gum, and lack of lip seal are characteristics of adenoid faceies.
- Hyponasal speech
- Presence of middle ear effusion
- Abnormality of the tympanic membrane: Retraction, decreased mobility of the tympanic membrane by pneumatic otoscopy
- Visible hypertrophic adenoid: The adenoid can be visualized through anterior rhinoscopy or endoscopy if the turbinate is not congested. An obstructing adenoid can sometimes be seen protruding through the choanae (Fig. 191.1).
- Postnasal drip and nasopharyngeal discharge are seen in chronic adenoid infection.
- Nasal discharge at the middle meatus is suggestive of sinusitis.

FIG. 191.1 Preoperative adenoid mass: Endoscopic view of hypertrophic adenoid protruding through the choana.

Imaging

- Chest radiograph
- Lateral nasopharyngeal radiograph

Evaluation of the adenoid size is done by radiographic imaging or imaging obtained from nasal endoscopy. Plain lateral radiograph of the nasopharynx is used for the measurement of the adenoid-nasopharyngeal (A/N) ratio. The most popular method is the measurement by Fujioka et al. used since 1979.[4] A/N ratio is the ratio of the distance from the maximal convexity of the adenoid to the anterior margin of basiocciput (adenoid width) divided by the distance between the posterior edge of the hard palate to the anteroinferior edge of the sphenooccipital synchondrosis (nasopharyngeal width). An average value of normal A/N ratio is 0.63 to 0.73.

The ratio of the adenoid tissue to the choanal opening is measured from the image obtained by the zero degree rigid nasal endoscope. The ratio of the area of the adenoid to the choanal opening is calculated by the Photoshop program. A/N ratio was found to have good correlations with nasal endoscopic examination and intraoperative mirror examination.

Surgical Indications

Adenoidectomy in Otitis Media With Effusion

- Adenoidectomy is done with the first set of tympanostomy tube insertion if the patient has the concurrent problem of the adenoid such as chronic nasal obstruction, OSA, or chronic sinusitis.[2]
- For the patients who do not have problems with the adenoid, adenoidectomy is indicated for OME when myringotomy is done for the insertion of the second set of tympanostomy tubes, regardless of the size of the adenoid, provided that the patient does not have any contraindications for adenoidectomy.

Adenoidectomy in Chronic Sinusitis

- Chronic or recurrent sinusitis that fails medical management[3]: Adenoidectomy is the first-line surgical management of chronic sinusitis in children before functional endoscopic sinus surgery, especially in children aged up to 6 years. In children aged 6 to 12 years, adenoidectomy is also considered effective as a first-line treatment according to the clinical consensus statement in pediatric chronic rhinosinusitis.[5]

Adenoidectomy in Obstructive Sleep Apnea

- Adenotonsillar hypertrophy with symptoms and signs of OSA

Contraindications

- Cleft palate
- Submucous cleft palate and velopharyngeal insufficiency (VPI): Adenoidectomy can cause worsening of VPI and hypernasal speech; therefore it should be avoided. If necessary, superior pole adenoidectomy can be done in some cases.
- Hematologic conditions causing coagulopathy: Some of the conditions can be reversed before surgery and therefore are considered as relative

contraindications, such as in patients who are using anticoagulants, which should be withdrawn 7 to 14 days before surgery. Consultation with a hematologist should be obtained in patients with von Willebrand disease and other coagulopathy.

Preoperative Preparation

- Informed consent
- Routine preoperative laboratory preparation with special attention to coagulation profile and special screening test for von Willebrand disease in patients with history of abnormal bleeding or have family history of abnormal bleeding
- Preoperative physical examination: Patients must be free from upper respiratory tract infections (URIs) at least 2 weeks before surgery to avoid acute inflammation of the tissue that may lead to excessive bleeding during surgery.
- Investigation for OSA
  - Polysomnography: To assess the severity of the disease. Patients with severe symptoms should have polysomnography to evaluate the apnea-hypopnea index (AHI) and degree of oxygen desaturation.
  - Investigation for complications of OSA: Physical examination of the cardiovascular system and echocardiogram to rule out right ventricular hypertrophy, pulmonary hypertension, and systemic hypertension
- Admission for postoperative monitoring is required for high-risk patients.
- Investigation for special populations: Special populations such as patients with Down syndrome, craniofacial, or syndromic anomalies should have specific preoperative investigations according to their conditions. Patients with Down syndrome should have an evaluation of the cervical spine to rule out subluxation because the surgery is done with neck extension. Patients with craniofacial anomalies or obesity who have OSA should have polysomnography to assess the degree of severity and desaturation.

Operative Period

Anesthesia

- Preoperative sedation should be avoided in children with OSA.
- The anesthesiologist should be notified in advance if the patients have severe OSA or have problems that will increase risks of general anesthesia.
- General anesthesia is done with oral endotracheal intubation.
- The endotracheal tube should be secured in the midline position, especially when tonsillectomy is to be performed with adenoidectomy.
- Once the patient's neck is extended, the anesthesiologist should check the position of the endotracheal tube. Stability of the endotracheal tube and airway pressure should be checked again after the placement of the mouth gag.

Positioning

- Supine position with neck extension on a shoulder roll (Rose position)
- A head ring is placed to stabilize the head of the patient.
- The eyes are protected with eye ointment and taped shut.
- The head and part of the face are draped, protecting the eyes and leaving the exposure for the nose and the oral cavity.

Perioperative Antibiotic Prophylaxis

- Perioperative antibiotics are not routinely administered.
- Antibiotics prophylaxis for bacterial endocarditis can be given to patients with underlying cardiac disease as necessary.

Monitoring

- Routine anesthesia monitoring

Instruments and Equipment to Have Available

- The complete set of instruments for conventional technique of adenoidectomy is shown in Fig. 191.2.
- Adenoid curettes are available in different widths and angles (Fig. 191.3). The curette is used with a nasopharyngeal mirror for the removal of the adenoid under the direct vision.
- St. Clair Thompson adenoid forceps are used for grasping the tissue or cutting with its sharp inner surface (Fig. 191.4).
- Suction electrocautery

FIG. 191.2 Complete set of instruments for conventional adenoidectomy. Adenoid curettes and adenoid forceps are used for removal of the adenoid.

FIG. 191.3 Various sizes of adenoid curettes.

FIG. 191.4 St. Clair Thompson adenoid forceps.

FIG. 191.5 Palpation of the palate to rule out submucous cleft.

Key Anatomic Landmarks

- The choana: The vomer and posterior end of the turbinates
- The roof of the nasopharynx
- The torus tubarius and the eustachian tube

Prerequisite Skills

- Nasopharyngeal mirror examination
- Nasal endoscopy
- Suction cautery
- Special skills for specific instruments (optional): Coblator, microdebrider, harmonic scalpel

Operative Risks

- Eye injuries, especially corneal injuries, are preventable by taping the eyes shut with caution. When the head is draped, be careful not to place the catheters or instruments such as towel clips or clamps over the eye area.
- Injuries to the lips, upper teeth, mucosa of the oral cavity, and posterior pharyngeal wall can occur during endotracheal intubation and during the application of the mouth gag.
- Injury to the torus tubarius and the Eustachian tube
- Bleeding from the nasopharyngeal bed

Surgical Technique

- The McIvor mouth gag with a slotted tongue depressor is inserted and the mouth is opened. The mouth gag is suspended to the Mayo stand.
- Palpation of the palate to rule out the submucous cleft (Fig. 191.5). Bifid uvula, notched hard palate, and absence of the muscle of the soft palate (zona pellucida) are signs of submucous cleft palate.

FIG. 191.6 Patient positioning and soft palate retraction for adenoidectomy.

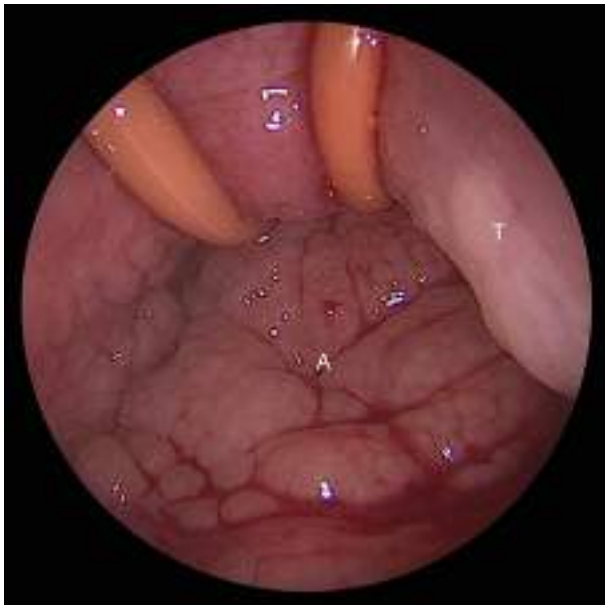

FIG. 191.7 Adenoid in the operative site: The soft palate is retracted by the red rubber catheters; adenoid mass *(A)* is exposed with the torus tubarius *(T)* on the lateral side.

- The throat is packed with roll gauze to prevent the blood from entering the larynx. A few drops of 0.025% of oxymetazoline are put in the nostrils to decongest the nasal cavity.
- A red rubber catheter (Fr 6 or 8) is passed through each nostril to the nasopharynx and retrieved through the oral cavity. The catheter is clamped on both ends to retract the soft palate and passed over the head drape (Fig. 191.6).
- The adenoid is then visualized through a nasopharyngeal mirror, and both sides of the torus tubarius are identified (Fig. 191.7).
- The nasopharyngeal mirror is held in the left hand, and the adenoid curette is applied by the right hand using the right thumb as a fulcrum. The adenoid curette is used to remove the adenoid under vision. Most of the adenoid mass is removed through the first few swipes using the wide-shaped adenoid curette. The removed adenoid is shown in Fig. 191.8.
- The rest of the nasopharyngeal lymphoid tissue is removed with the smaller sized curette or the adenoid forceps and suction cautery.

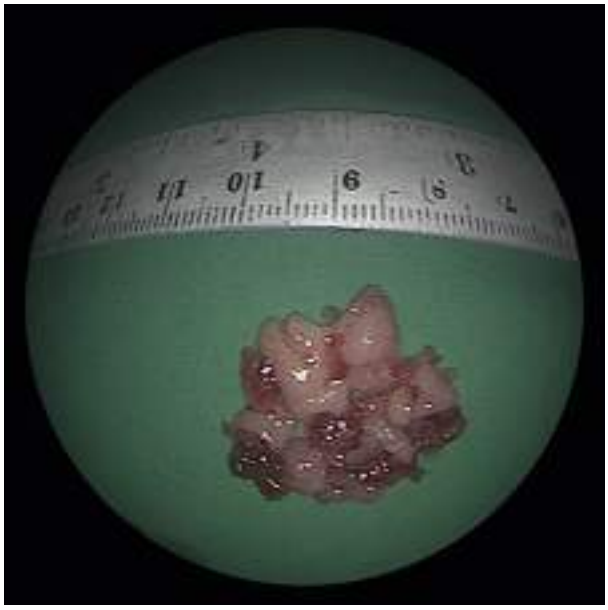

FIG. 191.8 The removed adenoid mass.

BOX 191.1 Hint and Tips

1. Identify both torus tubarius before curetting the adenoid.
2. Visualize the adenoid and the nasopharyngeal bed with nasopharyngeal mirror during the cutting; do not cut blindly when there is bleeding in the nasopharyngeal bed.
3. Bleeding is mostly from the raw surface; hemostasis is achieved with electrocautery and adequate nasopharyngeal packing.
4. Complete view of the choana should be visualized at the end of the procedure.

- Normal saline is irrigated through the nose and suctioned out of the oropharynx to provide the clear view of the nasopharyngeal cavity.

- Bleeding is stopped with gauze packing soaked with oxymetazoline.
- Hints and tips for the procedure are shown in Box 191.1.
- Other techniques or instruments: Electrocautery, coblator, microdebrider, harmonic scalpel, laser

Trends of the instruments used in adenotonsillectomy changed over time. A survey by Walner et al.[6] showed that the most popular instrument was electrocautery, followed by coblation, cold dissection with electrocautery, and cold dissection with bipolar electrocautery. The techniques and instruments for adenoidectomy had been compared to each other in many studies. Cold curettage was done with less mean operative time but more blood loss when compared to coblation. Rate of revision surgery was not different between suction coagulation and cautery compared to the microdebrider. Adenoidectomy by suction coagulation provided less blood loss when compared to a historical control group of adenoidectomy by cold curettage.

Common Errors in Technique

- Injury to the torus tubarius is most likely to occur during the removal of large adenoid pads that obscure the view of the nasopharynx.
- Curetting too deep in the nasopharynx may cause excessive bleeding.

Postoperative Period

Postoperative Management

- Admission and postoperative monitoring is required in the high-risk patients.

Adenoidectomy can be performed as a day surgery in healthy children not younger than 3 years old with no underlying diseases or suspicious history of abnormal bleeding.

High-risk patients with OSA undergoing adenotonsillectomy, according to the guideline,[7] are children younger than 3 years, patients with severe OSA diagnosed by polysomnography, patients with cardiac

complications of OSA, patients with underlying craniofacial anomalies or neuromuscular disorder, and patients with obesity or failure to thrive.

- Close observation for airway obstruction: The patients should be placed in semiprone position with continuous monitoring of vital signs and oxygen saturation. The effect of residual sedative medication after the operation should be monitored to avoid respiratory depression.
- Assessment for bleeding: Periodic examination of the oropharynx should be done to assess bleeding dripping down from the nasopharynx. Vasoconstrictor nose drops can be administered as necessary for minor bleeding.
- Pain control: Acetaminophen should be administered. The guideline for tonsillectomy[8] suggests that acetaminophen with codeine is not superior to acetaminophen alone. The use of nonsteroidal anti-inflammatory drugs is controversial. Pain from adenoidectomy without tonsillectomy is not severe, so nonsteroidal anti-inflammatory drugs may not be necessary.
- Intravenous fluid is routinely administered in the postoperative period. Without tonsillectomy, the patients usually tolerate oral intake well because there is no wound in the oral cavity.

Complications

Complications of adenoidectomy are divided into perioperative and delayed complications.

Perioperative Complications

- Trauma or burns to the facial and oropharyngeal area: Eye injuries, injuries to the lips, upper teeth, and mucosa of the oral cavity and posterior pharyngeal wall
- Malposition or obstruction of the endotracheal tube after extension of the neck or after the insertion of the mouth gag
- Airway complications during the induction of general anesthesia: In patients with OSA, desaturation and airway obstruction may occur during induction period.

- Pulmonary edema: In patients with prolonged history of airway obstruction from adenotonsillar hypertrophy, sudden relief of airway obstruction during endotracheal intubation can result in acute pulmonary edema and desaturation. Treatment is endotracheal intubation with positive end-expiratory pressure (PEEP) ventilation. Patients with preoperative pulmonary hypertension or high AHI are at risk for pulmonary edema.
- Hemorrhage is an important perioperative complication of adenoidectomy. Bleeding from the nasopharyngeal bed is mostly raw surface bleeding, which is usually stopped by cautery and nasopharyngeal packing with the use of a vasoconstrictor. Avoid dissection too deep in the nasopharyngeal mucosa to prevent excessive bleeding. Good visualization allows for precise hemostasis.
- Injury to the Eustachian tube: The adenoid and the Eustachian tube should be visualized clearly for the precise cut.

Delayed Complications

- Regrowth of the adenoid: Incidence of symptomatic regrowth of the adenoid in the literature is less than 1% to 3%. Rate of revision surgery is approximately in the same range for all of the popular instruments: for microdebrider, 0.84%; for suction coagulator, 1.5% to 1.7%; and for curettage, 1.6%.
- Nasopharyngeal stenosis is a rare complication of adenoidectomy resulting from inflammation of nasopharyngeal raw surface followed by fibrosis of the nasopharynx. Symptoms are recurrences of nasal obstruction or OSA. The onset of symptoms varies from 3 to 10 weeks after surgery. Laser adenoidectomy by potassium titanyl phosphate (KTP) laser was reported in the literature to cause seven cases of nasopharyngeal stenosis. VPI was mentioned in the literature as a possible complication of adenoidectomy. This can be avoided by a careful history taking and preoperative physical examination. History suggestive of VPI includes nasal regurgitation and hypernasal speech. Physical examination can reveal cleft palate or short, tight soft palate, or bifid uvula.
- Grisel syndrome is one of the rare complications that can occur after

adenotonsillectomy or other surgical procedures of the head and neck. It occurs mostly in children. The pathology is nontraumatic atlanto-axial subluxation due to an inflammation in the prevertebral area. Periligamentous inflammation of the anterior transverse ligament causes laxity of the ligament and imbalance of the cervical spine. Nasopharyngeal infection/inflammation and other infections such as otitis media, tonsillitis, and surgical procedures such as mastoidectomy had been reported to be the cause of Grisel syndrome, which occurs within a week after surgery or infection. The patient presents with painful torticollis and limited neck motion. The patient should be evaluated with imaging of the cervical spine and neurosurgical consultation. Treatment includes conservative management with anti-inflammatory drugs, antibiotics, and immobilization. Surgical management can be considered if the condition progresses.

Alternative Management Plan

- Antibiotics
- Intranasal steroid
- Leukotriene antagonist (montelukast)

Discussion

Evidence-Based Medicine Question

What is the outcome of adenoidectomy for otitis media with effusion, obstructive sleep apnea, and chronic sinusitis?

There was a Cochrane review confirming the benefit of adenoidectomy in the resolution of OME. The benefit is not confirmed in acute otitis media (AOM). There has been a review in 51,373 children in Australia who had adenoidectomy with their first myringotomy; the odds for subsequent myringotomy are less than the group of first myringotomy without adenoidectomy[9] (odds ratio 0.61, 95% CI 0.52 to 0.72, P <.001).

The relationship between the adenoid and pediatric sinusitis was proven by the correlation of bacteria in the middle meatus and the

adenoid. There was a report of significant reduction of recurrent sinusitis and obstructive sleep disorder after adenoidectomy.[10] Meta-analysis showed that the pooled effect of symptomatic relief of pediatric sinusitis after adenoidectomy was 69.3%.

Editorial Comment

Adenoidectomy has been performed for over two centuries. During this period, new tools and technologies have been introduced, but the basic technique of adenoidectomy has remained unchanged. The indications for the procedure, however, have been revised based on scientific evidence. Although considered to be a simple procedure, there may be significant complications, both immediate and delayed. The surgeon should be aware of these complications and have a comprehensive discussion with the patient's family prior to embarking on surgery.

Review Questions

1. Which of the followings is *not* an indication for adenoidectomy?

   a. **Recurrent acute otitis media**

   b. Persistent middle ear effusion for more than 90 days

   c. Chronic sinusitis that fails medical management

   d. Obstructive sleep apnea from adenoid hypertrophy

2. Which of the following structures can be injured during adenoidectomy?

   a. Vomer

   b. **Torus tubarius**

   c. Middle turbinate

   d. Nasolacrimal duct

3. Which of the following patients is a high-risk patient that needs

admission for close observation?

a. A 5-year-old boy with delayed development

b. A 4-year-old boy with adenotonsillar hypertrophy

c. **A 9-year-old obese girl with severe obstructive sleep apnea**

d. A 6-year-old girl with immotile cilia syndrome

Tonsillectomy

Phillip Huyett, and Joseph E. Dohar

Introduction

Tonsillectomy was first performed over 2000 years ago, with the oldest reference to the procedure dating back to 1000 BC.[1] As the safety and indications evolved, so did the popularity of tonsillectomy. Most notably, the 1970s and 1980s saw a transition of the most common indication for tonsillectomy from recurrent throat infections to sleep-disordered breathing (SDB).[2,3] Today, more than 500,000 tonsillectomies are performed annually in the United States, making it the most common major surgery and the second most commonly performed procedure on children behind myringotomy with tube insertion.[4] As a consequence, tonsillectomy has garnered significant attention in the literature with high-quality evidence in the form of randomized controlled trials, systematic reviews, and the 2011 clinical practice guideline (CPG) published by the American academy of otolaryngology-head and neck surgery (AAO-HNS).[5]

Unless otherwise specified, tonsillectomy refers to the removal of the palatine tonsils bilaterally. Continuous with the adenoids, lingual tonsils, Eustachian tonsils, and lateral pharyngeal bands, the palatine tonsils make up Waldeyer's ring, a collection of lymphoid organs belonging to the secondary immune system. This lymphoid tissue is ideally situated to serve as a first barrier for sampling of antigens entering the upper aerodigestive tract. The tonsils have deep, epithelial-lined crypts that significantly enhance interaction between antigen-presenting cells and foreign substances. The peak immune activity and size of the palatine tonsils occurs between age 3 and 10 years.[6] Such a proposed function notwithstanding, there is little to no evidence to suggest that children who undergo bilateral pharyngeal tonsillectomy sustain clinically

significant immune deficiency.[7]

Key Operative Learning Points

- Tonsillectomy is most commonly indicated for SDB and recurrent pharyngotonsillitis.
- Identification of the plane between the capsule of the tonsil and the constrictor muscle will facilitate the procedure.

Preoperative Period

History

History of Present Illness

In patients referred for the evaluation of SDB, sleep symptoms such as enuresis, snoring, gasping, choking, coughing, and frank apneas are reported by the caregiver. The treating physician can confirm this with sleep video-sonograms readily recorded by caretakers given the widespread availability of cellular telephone video cameras. Caregivers and schoolteachers may also report a range of nonsleep manifestations and consequences including poor school performance, growth failure, and behavioral problems such as aggression, hyperactivity or hypersomnolence, and depression.

The otolaryngologist is rarely consulted for recurrent tonsillitis in the midst of an acute episode of pharyngotonsillitis. Hence, to meet evidence-based criteria to justify tonsillectomy, each episode of sore throat must be documented by the primary care physician with accompanying fever greater than 38.3°C, positive group A β-hemolytic streptococcal (GABHS) culture, tonsillar exudate, tender cervical lymphadenopathy, or lymph nodes greater than 2 cm. Primary care records are often no longer a single source of documentation with the evolution of acute care (express and urgent care centers) where health care providers diagnose and treat this common disorder. Patients may also present with complaints of chronic halitosis, recurrent tonsil stones, dysphagia, or muffled voice.

Past Medical History

- Prior treatment
  - Multiple courses of oral systemic antibiotics
  - Continuous positive airway pressure (CPAP)
  - Other surgeries (see Alternative Management Plan)
- Past medical history
  - Bleeding disorders or signs of easy bleeding or bruising (given the risk of posttonsillectomy hemorrhage)
- Family history
  - A family history of rheumatic fever or heart disease should prompt a discussion of tonsillectomy in a child with GABHS pharyngotonsillitis, regardless of the frequency.
  - Because this often represents a child's first operation, family history of excessive bleeding or adverse reactions to anesthesia should be queried.
- Medications
  - Medications with anticoagulant activity should be noted and, if possible, discontinued prior to and immediately following surgery.
- Allergies
  - Patients who have developed multiple antibiotic allergies during the treatment of recurrent pharyngotonsillitis may be offered tonsillectomy.

Physical Examination

- Tonsils are most commonly graded from 0 to 4+, based on their position relative to the tonsillar pillars and oropharyngeal opening (Fig. 192.1).[8] Interestingly, Brodsky tonsil size (see Fig. 192.1) does not correlate with the severity of obstructive sleep apnea (OSA); however, patients with larger tonsils are more likely to have complete resolution of SDB after removal.[9]

- The examiner should carefully evaluate for the presence of a bifid uvula, zona pellucida, and notch of the posterior hard palate bearing, in mind that even in the absence of any of these oropharyngeal stigmata of submucous cleft palate, an occult submucous cleft palate may nonetheless be present and may become symptomatic following an their adenoidectomy.
- A narrow hard palate in a child with OSA may require palatal expansion in addition to adenotonsillectomy.
- A patient with adenoid hypertrophy, which frequently coexists with tonsillar hypertrophy, may exhibit an elongated face, open mouth breathing, and hyponasal speech.

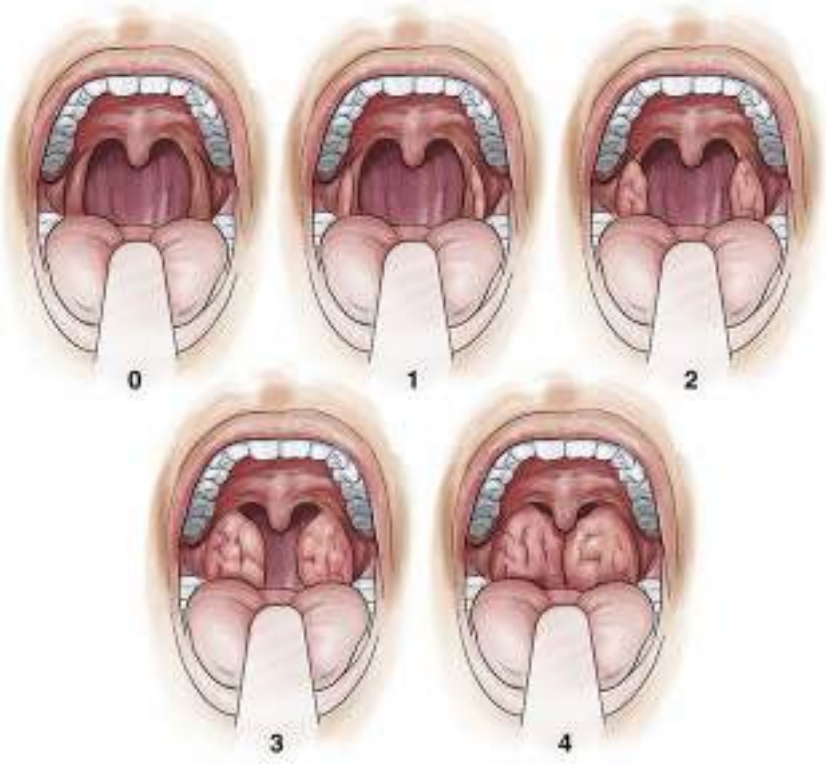

FIG. 192.1 Brodsky tonsillar grading system. From Baugh RF, Archer SM, Mitchell RB, et al.: Clinical practice guideline: Tonsillectomy in children. *Otol Head Neck Surg* 144(1 Suppl):S1-S30, 2011, with permission.

- If adenoidectomy is being considered, nasal endoscopy, a lateral neck radiograph, or physical examination at the time of tonsillectomy can reveal adenoid hypertrophy.

Imaging/Diagnostics

1. No imaging is indicated prior to routine tonsillectomy.

2. Flexion/extension cervical spine films should be obtained in Down syndrome children due to the risk of C1-C2 subluxation.

   a. Alternative: Cervical spine magnetic resonance imaging (MRI)

   b. The appropriate age at which such evaluations are appropriate and the most cost-effective studies are subjects of ongoing debate.

   c. Many experts consider clinical manipulation of the neck in the office to elicit symptoms and no evaluation at all to be sufficient.

   d. Shoulder roll should be avoided regardless.

3. A computed tomography (CT) angiogram may be pursued in a child with 22q11.2 syndrome to assess the degree of carotid artery medialization.[10]

4. In-lab overnight polysomnography (PSG) is the gold standard for the diagnosis of OSA.

   a. Home sleep study has not yet been approved for the diagnosis of pediatric OSA.

   b. An apnea-hypopnea index (AHI) of 1 to 5 represents mild OSA, 5 to 15 moderate OSA, and greater than 15 severe OSA.

   c. O_2 saturation of less than 92% is considered abnormal in children.

   d. PSG is indicated in children with a discordance between reported severity of signs/symptoms and tonsil size as well as those with complex medical histories such as Down syndrome, obesity, craniofacial abnormalities, sickle cell anemia, neuromuscular disorders, or mucopolysaccharidoses.

5. Drug-induced sleep endoscopy (DISE) is a useful adjunctive tool in children with OSA but an uncertain level of obstruction.

6. Sleep cine-MRI has been suggested as a valuable diagnostic means by which to investigate patients with persistent OSA despite adenotonsillectomy surgery.

Indications

- SDB describes partial or complete upper airway obstruction during sleep and affects approximately 12% of children. The condition ranges from nonobstructive snoring to OSA, which occurs in about 1% to 3% of children. Adenotonsillar hypertrophy is the most common cause of SDB in children and thus SDB represents the most common indication for pediatric tonsillectomy.
  - An AHI greater than 1 and oxygen desaturations below 92% are indications for tonsillectomy, but the decision to proceed with surgery should be made in the context of the history and physical examination.
  - Children with a history strongly suggestive of SDB or OSA and physical examination revealing tonsillar and/or adenoid hypertrophy do not necessarily require a preoperative PSG. Indeed, about 90% of children proceed to tonsillectomy based on clinical history and physical examination alone.

TABLE 192.1

Paradise Criteria

Criterion	Definition
Minimum frequency of sore throat episodes	7 or more episodes in the preceding year, OR
	5 or more episodes in each of the preceding 2 years, OR
	3 or more episodes in each of the preceding 3 years
Clinical features (sore throat plus the presence of one of more qualifies as a counting episode)	Temperature >38.3°C, OR
	Cervical lymphadenopathy (tender lymph nodes or >2 cm), OR
	Tonsillar exudate, OR
	Positive culture for group A β-hemolytic streptococcus
Treatment	Antibiotics were administered in conventional dosage for proved or suspected streptococcal episodes.
Documentation	Each episode and its qualifying features were substantiated by contemporaneous notation in a clinical record, OR
	If not fully documented, subsequent observance by the clinician of 2 episodes of throat infection with patterns of frequency and clinical features consistent with the initial history*

* This last statement allows children who meet all other criteria for tonsillectomy except documentation to nonetheless qualify for surgery if the same pattern of reported illness is observed and documented by the clinician in two subsequent

episodes. Because of this tendency to improve with time, a 12-month period of observation is usually recommended prior to consideration of tonsillectomy as an intervention.

From Baugh RF, Archer SM, Mitchell RB, et al.: Clinical practice guideline: tonsillectomy in children. Otolaryngol Head Neck Surg, 2011.

- **Recurrent pharyngotonsillitis** represents the second most common indication for tonsillectomy. The definitions for a sore throat episode and requirements for tonsillectomy are based on randomized controlled trial data from 1984 (Table 192.1).
  - The "Paradise criteria" state that at least seven documented episodes of pharyngotonsillitis in 1 year, five in each of the last 2 years, or three in each of the last 3 years should be present to perform tonsillectomy for recurrent pharyngitis. There should be complete medical record documentation rather than caregiver report.
- There are several other infectious indications for tonsillectomy that are less stringently defined (Table 192.2):
  - Acute or Quinsy tonsillectomy for **acute tonsillitis** or peritonsillar abscess, generally when causing severe illness, airway obstruction, or refractory to incision and drainage.
  - Interval tonsillectomy for recurrent **peritonsillar abscesses** (PTAs), generally after two or more. Once the tonsils are removed, recurrent PTA is exceptionally rare.
  - In **Lemierre syndrome** (thrombophlebitis of the internal jugular vein most often related to tonsillitis and peritonsillar abscess), it is reasonable to perform tonsillectomy following acute treatment with antibiotics and incision and drainage, although there is scant evidence on the incidence of recurrence of Lemierre syndrome.
  - Tonsillectomy is an effective treatment for periodic fever, aphthous stomatitis, pharyngitis and adenitis **(PFAPA)** and reduces the number, frequency, duration, and severity of episodes as well as the need for steroids.
  - In pediatric autoimmune neuropsychiatric disorders associated with streptococcal **(PANDAS)** infections, the role of tonsillectomy is not as clear.
  - A child with **tonsillar asymmetry** alone is not a candidate for

tonsillectomy in the absence of other indications or signs and symptoms concerning for lymphoma.

- Acute **upper airway obstruction** due to tonsillar enlargement is most often seen in **infectious mononucleosis.** Acute tonsillectomy for this indication has been shown to reduce the number subsequent episodes of tonsillitis.

- Many indications lack concrete evidence and require thorough clinical evaluation and documentation (Table 192.2):
  - Excessive illness requiring significant missed school time
  - Febrile seizures related to tonsillitis
  - The development of multiple antibiotic allergies related to treatment of recurrent tonsillitis
  - Severe halitosis
  - Recurrent **tonsillithiasis** is an indication in patients in whom improved oral hygiene and self-removal techniques have failed.
  - Malocclusion related to tonsillar hypertrophy
  - Guttate psoriasis

Contraindications

- In patients with significant bleeding disorders, tonsillectomy is not contraindicated but the risks should be adequately justified by the benefits and clearly outlined to the patient and family.

Preoperative Preparation

- Informed consent from the caregiver and assent from the patient where appropriate should include the major risks described in the following sections. The child should plan to miss 1 to 2 weeks of school.
- When a personal or family history is suggestive of a bleeding disorder, serologic coagulation testing with consideration of a hematology consultation should be obtained.
- Routine blood tests are not cost-effective.

Operative Period

Anesthesia

- General anesthesia
- Oral intubation
- Endotracheal tube is centered on the base of tongue and taped in the midline to the mentum.
- After positioning, confirm that the endotracheal tube was not inadvertently removed or kinked.
- Fraction of inspired oxygen (FiO_2) less than 30% if electrocautery is to be used to avoid an airway fire

Positioning

- The bed is rotated such that the surgeon sits or stands above the head of the patient.

TABLE 192.2

List of Indications

Airway	Infectious	Quality of Life
• Sleep-disordered breathing • Airway obstruction • Tonsillar asymmetry • Removal of foreign body	• Recurrent pharyngotonsillitis • PFAPA • Recurrent peritonsillar abscess • Lemierre syndrome • Psoriasis (guttate) • Severe illness • Febrile seizures • Significant missed school time • PANDAS	• Severe halitosis • Tonsillithiasis • Malocclusion • Dysphagia

PANDAS, Pediatric autoimmune neuropsychiatric disorders associated with streptococcal; *PFAPA,* periodic fever, aphthous stomatitis, pharyngitis, and adenitis.

- In the absence of a contraindication (Down syndrome), a shoulder roll is placed.
- An appropriately sized McIvor or Crowe-Davis mouth gag is placed and suspended from a Mayo stand to displace the tongue and

endotracheal tube inferiorly.

- The rubber portion of the curved wire should be hooked on the lateral incisors or canines of the maxillary dentition and not the upper lip, being mindful of the presence of loose teeth.
- A plastic lip-cheek retractor or moist gauze may be placed to protect the lips and perioral soft tissue from thermal burns.
- The endotracheal tube should adequately protected within the midline groove of the tongue blade.
- Most of the tongue base is covered by the blade. If there is excessive tongue base or lateral tongue herniating into the field, the blade of the mouth gag is too small.
- If the tongue prolapses around the blade, it may become necessary to position the blade for removal of the first tonsil and then reposition it for removal of the second tonsil.
- Draping is based on surgeon preference, but taping and protecting the eyes with a blue towel are recommended at a minimum.
- We discourage the use of a throat pack to eliminate the potential for a retained/airway foreign body.
- This combination of positioning facilitates visualization of the palatine tonsils, especially the inferior pole (Fig. 192.2).

Perioperative Antibiotic Prophylaxis

- Preoperative antibiotics are strongly recommended against based on the lack of apparent benefit with risks including rash, allergy, gastrointestinal upset, and antimicrobial resistance.[5]
- The CPGs[5] also strongly recommend the administration of intravenous steroids intraoperatively. There is a reduction in postoperative nausea, vomiting, time to resuming oral diet, and pain. Generally, 0.15 to 1.0 mg/kg of dexamethasone is given in a single dose.

Monitoring

- No routine monitoring

Instruments and Equipment to Have Available

- Standard tonsillectomy and adenoidectomy set, which typically includes a mouth gag, different-sized tongue blades, a Hurd retractor, Allis clamp, Yankauer suction, laryngeal mirror, forceps, and clamps by preference
- Tonsil balls, red rubber catheters, and a plastic cheek retractor are often used.
- The advantages and disadvantages of different tonsillectomy instruments are summarized in Table 192.3.

FIG. 192.2 Positioning of the McIvor mouth gag.

Key Anatomic Landmarks

- The tonsils are bounded by the palatoglossus muscle anteriorly and palatopharyngeus muscle posteriorly. Along with the overlying mucosal covering, these muscles make up the anterior and posterior tonsillar pillars, respectively.

- Lateral to the tonsillar capsule is the superior constrictor muscle, and the loose areolar tissue between constitutes the peritonsillar potential space.
- The blood supply arises from the ascending palatine, lingual (dorsal lingual), facial (tonsillar and ascending palatine), and maxillary (descending/lesser palatine) arterial branches of the external carotid system. Venous drainage is via the tonsillar veins of the external palatine, pharyngeal, and facial veins.
- The internal carotid artery lies 2 to 2.5 cm posterolateral to the tonsil in the poststyloid parapharyngeal space.
- Sensation from this region is transmitted via the lesser palatine (V2) and glossopharyngeal nerves. Branches of the glossopharyngeal nerve to the tongue base pass deep to the palatine tonsil to provide sensation and taste.
- Lymphatic drainage is to level 2 and retropharyngeal lymph nodes.

Prerequisite Skills

- Bimanual dexterity allows the surgeon to remove each tonsil with the hand that is ipsilateral to it.

TABLE 192.3

Comparison of Methods for Tonsillectomy and Tonsillotomy

Method	Advantages	Disadvantages
Monopolar electrocautery	Low cost, short operative time	Increased postoperative pain
Coblation	Reduced pain	Increased cost, possible higher rate of late PTH
Cold steel	Inexpensive, lower PTH, compatible with medical devices, decreased pain	Increased intraoperative bleeding and operative time
Diode laser	Decreased operative time and blood loss	Increased postoperative pain
Bipolar scissors	Ease of use, decreased operative time	Increased cost and PTH
Harmonic scalpel	Decreased intraoperative bleeding and post op pain	Increased cost
LigaSure	Decreased intraoperative bleeding, operative time and postoperative pain	Increased cost
Tonsillotomy (CO_2 laser, microdébrider, radiofrequency ablation, coblation)	Less pain and bleeding risk, similar reduction in infectious, sleep, quality of life, and behavioral symptoms	Risk of symptom recurrence, tonsil regrowth, relative contraindication for recurrent tonsillitis

PTH, Posttonsillectomy hemorrhage.

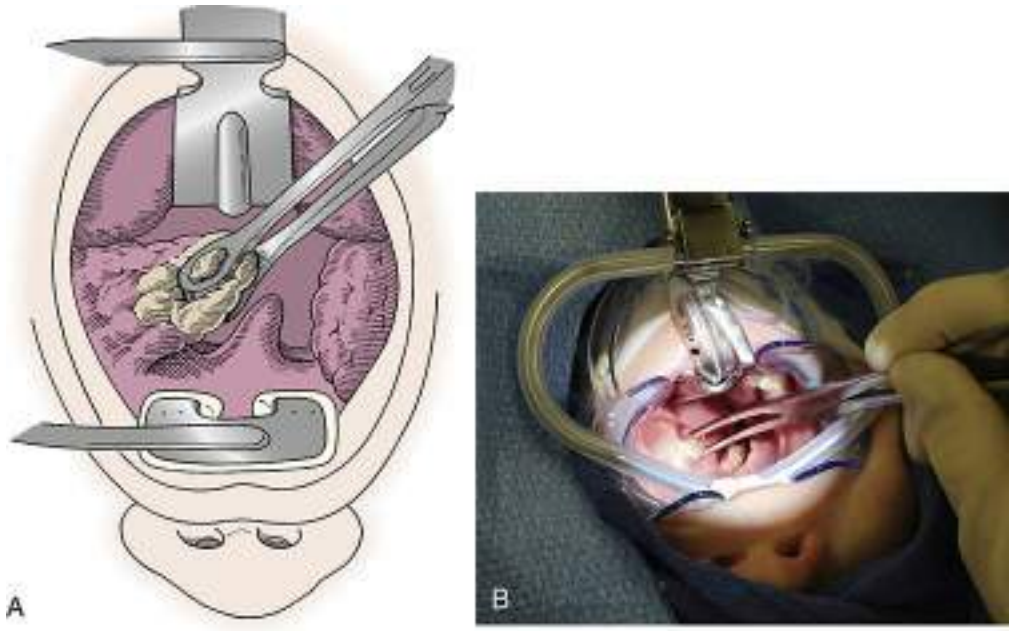

FIG. 192.3 Grasping the tonsil and retracting inferomedially. *(**A,** Redrawn from Hibbert J: Tonsils and adenoids. In Evans JNG, [ed]: Pediatric Otolaryngology. In Kerr AG, [ed]: *Scott Brown's Otolaryngology*. London: Butterworth-Heinemann; 1987, pp 368-383.*

Operative Risks

- Temporomandibular joint dislocation or condyle fracture
- Airway fire
- Intraoperative bleeding
- Vascular injury
- Burns or trauma to lips, teeth, gums, or soft palate
- Laryngospasm
- Dysgeusia

Surgical Technique

Tonsillectomy

- Regardless of the dissection instrument used (summarized in Table 192.3), the goal of tonsillectomy is to identify the tonsillar capsule and dissect between it and the superior constrictor muscle.
- The tonsil is grasped and retracted medially with a curved Allis forceps (Fig. 192.3). This is generally held with the hand opposite the tonsil being removed (e.g., left hand for right tonsil).
- By increasing and decreasing the force of retraction, the surgeon gets a sense of the depth of the tonsillar tissue.
- Enter the mucosal reflection of the anterior tonsillar pillar superolaterally. Here the palatoglossus muscle can be identified and preserved to prevent increased collapsibility of the soft palate, potentially worsening OSA (Fig. 192.4).
- With inferomedial retraction, the tonsillar capsule is readily identified deep to this initial incision.
- After repositioning the Allis clamp to the exposed superior pole and providing a more inferior vector of retraction, the tonsil is dissected from superior to inferior while rolling medially toward the posterior pillar along the capsular plane.
- Countertraction provided by the palate itself can be augmented by an assistant with a Yankauer suction.
- As the tonsil is dissected along a broad front, blood vessels are readily identified and controlled with electrocautery, clips, or ties prior to hemorrhage (Fig. 192.5).
- The loose areolar tissue between the tonsillar capsule and the constrictor muscle should be left in the patient because this likely reduces pain and bleeding associated with exposed muscle fibers.
- Keep the line of the mucosal incision directly adjacent to the tonsil because deviating from this approach results in unnecessary mucosal loss and pain.

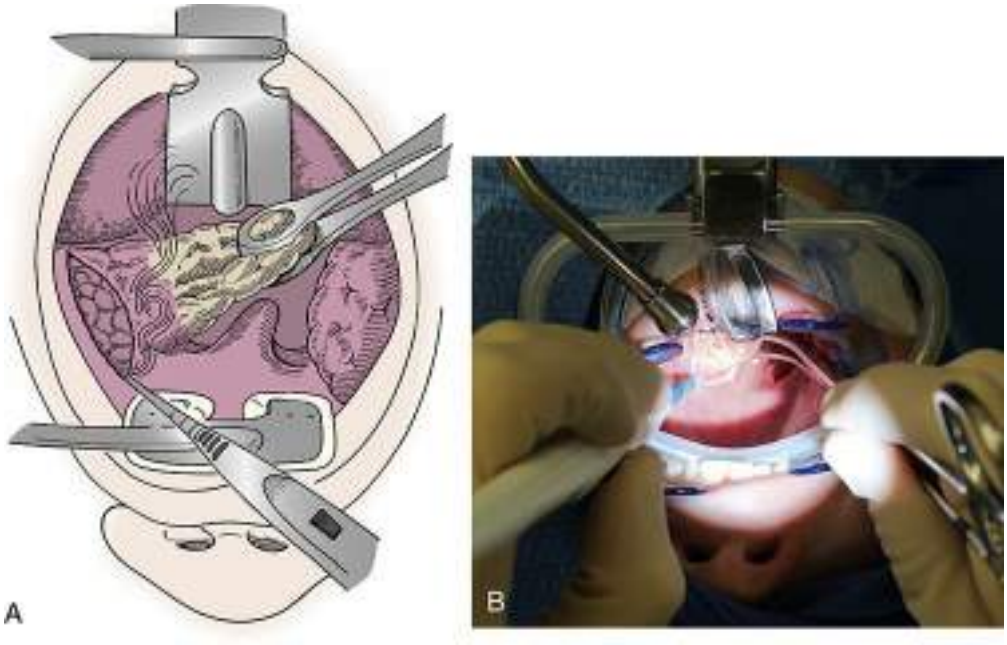

FIG. 192.4 Dissection through the anterior pillar mucosa, preserving the palatoglossus muscle and finding the capsule of the tonsil. *(**A,** Redrawn from Hibbert J: Tonsils and adenoids. In Evans JNG, [ed]: Pediatric Tolaryngology. In Kerr AG, [ed]: *Scott Brown's Otolaryngology*. London: Butterworth-Heinemann; 1987, pp 368-383.*

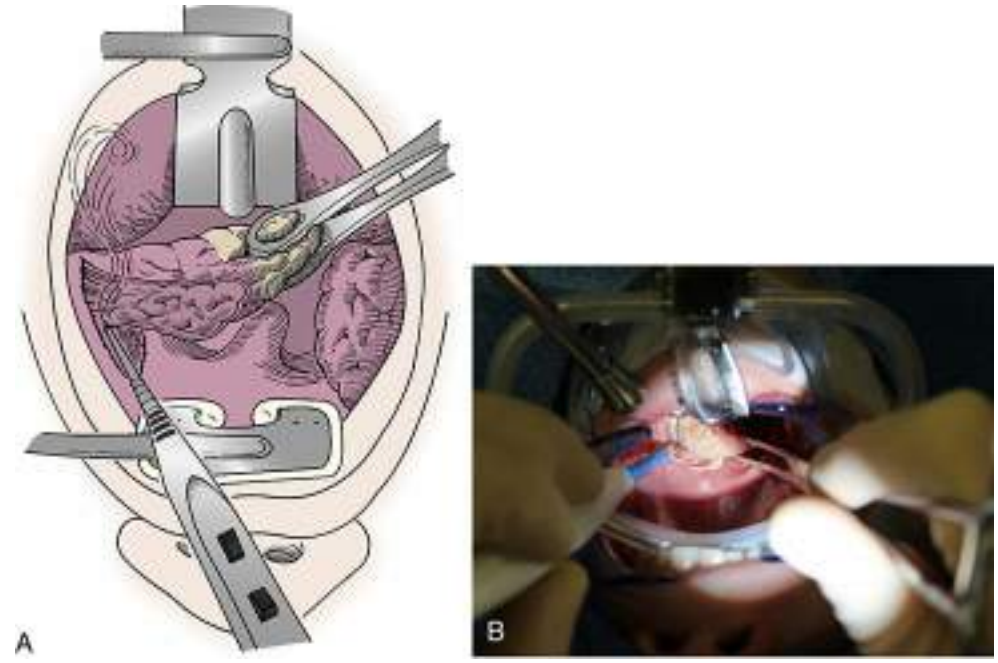

FIG. 192.5 Dissection continues along the plane of the capsule of the tonsil, cauterizing blood vessels as they

are encountered. The inferior pole is arbitrarily divided because there is often not a distinct division between the palatine and lingual tonsils. (***A***, Redrawn from Hibbert J: Tonsils and adenoids. In Evans JNG, [ed]: Pediatric Tolaryngology. In Kerr AG, [ed]: *Scott Brown's Otolaryngology*. London: Butterworth-Heinemann; 1987, pp 368-383.

- When the inferior pole is poorly defined, an arbitrary end point is chosen to avoid extending the dissection to the tongue base or hypopharynx.
- There is often increased vasculature inferiorly, which can present a challenge to control postoperatively, so careful coagulation of these vessels is optimally done at the time of amputation of the tonsil while the vessels are stretched.
- The same procedure is performed on the contralateral tonsil.
- The pharynx is irrigated with saline solution and the stomach suctioned with an orogastric tube.
- The mouth gag should be closed and left open for a few moments to ensure that bleeding is not evident because of vessel stretch and collapse resulting from mouth gag compression.
- Bleeding of any kind should be controlled immediately. Thus it is critical that the operating room team not remove electrocautery devices or the suction tubing before the patient exits the operating room.
- Difficult emergence from anesthesia and extubation with coughing, "bucking," or laryngospasm triggered by blood and secretions on the vocal cords can result in immediate postoperative bleeding and occasionally airway catastrophe. The surgeon should remain in the OR until the patient has been safely extubated and is comfortably and spontaneously ventilating.
- Should nasal or oral airways be needed to prevent airway obstruction, it is preferable for the surgeon to place these devices between the fresh surgical beds.
- At our institution, tonsils are routinely sent for gross pathologic examination individually, although the utility of this has been questioned. Routine microscopic analysis of all tonsillectomy specimens is not cost-effective. Asymmetric or otherwise concerning

tonsillar specimens should be sent fresh for histopathologic evaluation as lymphoma represents the most common occult malignancy in pediatric tonsillectomy specimens.

Intracapsular Tonsillectomy (Tonsillotomy)

- Intracapsular tonsillectomy or tonsillotomy was introduced in the mid-1990s in Sweden by Densert and coauthors under the hypothesis that a subtotal tonsillectomy would reduce postoperative morbidity while still relieving upper airway obstruction in children with SDB/OSA.
- Indeed, many studies have demonstrated equivalent efficacy, less postoperative bleeding and pain, with shortened recovery times and fewer readmissions for dehydration as compared to traditional tonsillectomy.
- As this inherently leaves tonsillar tissue behind, this procedure is generally not performed for recurrent tonsillitis and results in approximately 6% tonsillar regrowth.
- Tonsillar regrowth can be treated with observation if objective OSA is absent or with traditional tonsillectomy.
- The technique was initially described using a CO_2 laser but has been successfully performed with a microdébrider, diathermy scissors, radiofrequency ablation, coblation, and others.
- Tonsillotomy uses the same surgical setup as described earlier for tonsillectomy.
- The tonsil is grasped and retracted medially while the dissecting instrument removes the tonsil medial to the tonsillar capsule.
- Alternatively, the tonsillar tissue may be reduced with the dissecting instrument, ending the dissection medial to the tonsillar capsule.

Control of Posttonsillectomy Hemorrhage

- Active bleeding in the oropharynx should be treated as an airway emergency. This is most commonly first encountered by the emergency room physician who should consider the possibility of intubation prior to further management.

- If the airway is not secured, leaning over a kidney basin will help divert blood away from the airway.
- A hemoglobin and hematocrit should be measured and intravenous access obtained.
- If the patient is old enough and the bleeding is minor or a clot is present, examination and control with silver nitrate cautery at the bedside may be possible.
- More commonly, the child is unwilling to allow adequate examination, let alone intervention.
- In our institution, all actively bleeding children are brought to the operating room for emergent and definitive control. The presence of a blood clot requires a 24-hour admission and observation for further bleeding at a minimum.
- The anesthesiologist will often perform a rapid sequence induction and intubation because the patient has likely ingested significant quantities of blood and is in NPO (nothing by mouth) violation.
- The otolaryngologist must be present, gloved, gowned, and equipped with a headlight during the intubation because the procedure is made more difficult by bleeding. The room should be fully set up with two suctions readily available.
- Once the patient is safely intubated, the surgeon positions the child as if performing primary tonsillectomy.
- The pharynx is thoroughly irrigated to remove old blood and clots. Most often, the source of bleeding is active or has a fresh appearing clot overlying it.
- If bleeding is profuse, it may be controlled with direct pressure applied by a tonsil ball with or without a vasoconstricting substance while a plan is established.
- Generally, suction electrocautery is sufficient to clear bleeding and control ruptured vessels.
- Occasionally, a figure-of-eight suture is needed to oversew the vessel. Typically, an absorbable suture on a tapered needle is used.
- Once active bleeding is controlled, it is advisable to identify other

potential sites of bleeding. This can be performed by "roughing up" the tonsillar fossae with the Hurd retractor or tonsil ball.

- The stomach must be suctioned of blood contents because this is likely to cause significant nausea and vomiting, the retching associated with which can instigate further bleeding. As the blood clots in the stomach frequently block the suction, repositioning of the orogastric tube and irrigation with saline are often needed to completely evacuate and decompress the stomach.

Common Errors in Technique

- Failure to grasp a large enough bite of tissue will lead to excessive bleeding or loss of plane from regrasping or tearing tonsillar tissue.
- Failure to identify the proper plane of dissection may result in cumbersome bleeding.
- "Chasing" inferior pole tonsillar tissue rather than creating an arbitrary transition between tonsillar lymphoid tissue and lingual lymphoid tissue may result in troublesome immediate and delayed bleeding.
- Excessive removal of mucosa and exposure of the superior constrictor muscle will result in increased postoperative pain.

Postoperative Period

Postoperative Management

- Criteria for inpatient admission postoperatively include OSA (AHI >10 and/or O_2 nadir <80%), younger than 3 years of age, obesity, cardiopulmonary comorbidities, neuromuscular disorders, failure to thrive, recent illness, and craniofacial abnormalities.[5]
- Patients with poor oral intake or oxygen desaturations in the Post-Anesthesia Care Unit (PACU) should also be admitted.
- In keeping with the CPG recommendations against the use of codeine, there have been several studies relating the efficacy and safety of alternating liquid acetaminophen (15 mg/kg every 4 hours, maximum

of 5 doses/24 hours) and ibuprofen (10 mg/kg every 6 hours) for postoperative pain management. Be mindful of maximum daily doses.

- Nonsteroidal anti-inflammatory drugs (NSAIDs), with the exception of ketorolac, have not been shown to increase posttonsillectomy hemorrhage rates.
- Maintaining adequate hydration and administering medication on a scheduled basis are strategies to minimize pain.
- When a child is refusing by-mouth (PO) intake, rectal formulations of acetaminophen may be tried.
- If stronger pain medication is needed, we generally use a hydrocodone- or oxycodone-based elixir.
- There have been mixed results when examining the efficacy of postsurgical antibiotics in reducing pain. When analyzed together, the data suggest that routine prescription of postoperative antibiotics should not be given.
- There may be a role for postoperative oral steroids, because reduction in pain and improvement in activity, PO intake, and tonsillar fossa epithelialization were demonstrated when compared to children who did not receive oral steroids.
- The role of other adjunctive medications such as mouth rinses and sprays is less clear and generally prescribed in a provider-preference fashion.

Complications

- The number and severity of posttonsillectomy complications (Table 192.4) highlight the misconception that tonsillectomy is a minor procedure.
- Nausea, vomiting, and dehydration/poor PO intake represent the most common complications of tonsillectomy and are most often related to inadequate pain control.
- Posttonsillectomy hemorrhage (PTH) is the most commonly encountered serious complication after tonsillectomy.

- Bleeding occurring during the first 24 hours is known as primary PTH and occurs approximately 0.2% to 2.2% of the time.
- Primary PTH is probably due to inadequate hemostasis at surgery.
- Secondary PTH occurs after 24 hours but tends to peak at 7 to 10 days postoperatively. The cause of late bleeding is unclear but is believed to be related to the shedding of eschar formed at the time of surgery. Secondary PTH occurs 0.1% to 3% of the time.
- In a large review from the United Kingdom, patients with recurrent tonsillitis (3.7%) had higher bleeding rates than those with OSA only (1.4%). The highest rates were in patients undergoing a Quinsy tonsillectomy (5.4%).
- The method of tonsillectomy and PTH rates have been scrutinized with conflicting results. In general, "hot" surgical techniques (coblation, monopolar cautery) have increased secondary PTH rates when compared to cold steel techniques with packing or ligature. This is likely related to the vessel injury and eschar formed by the electricity, which becomes exposed in a delayed fashion.
- As mentioned earlier, there is no increased rate of PTH associated with NSAIDs in tonsillectomy; however, there may be an increased rate in tonsillotomy.

- Post-obstructive or negative pressure pulmonary edema is the sudden onset of pulmonary edema following the relief of obstruction. It may occur following the relief of an acute obstruction (e.g., laryngospasm, strangulation) and rarely occurs following the relief of chronic upper airway obstruction as seen in tonsillectomy. The diagnosis is made by history, physical, and chest radiograph and, once recognized, is treated with supportive care (diuretics, supplemental oxygen, and positive airway pressure).
- Death is exceptionally rare following tonsillectomy (1/16,000 to 1/35,000) and is most often related to severe hemorrhage, aspiration, cardiopulmonary failure, or electrolyte imbalance.

Alternative Management Plan

- CPAP and watchful waiting for SDB/OSA

- Although tonsillectomy and adenoidectomy are considered first-line surgical treatment for SDB/OSA, several other procedures are successfully used in appropriately selected children with persistent OSA following tonsillectomy and adenoidectomy:
  - Lateral pharyngoplasty
  - Lingual tonsillectomy
  - Lingualplasty
  - Laser/radiofrequency/coblation midline glossectomy
  - Maxillomandibular advancement
  - Transpalatal advancement pharyngoplasty
  - Mandibular distraction osteogenesis
  - Uvulopalatopharyngoplasty
  - Nasal septoplasty and inferior reduction turbinoplasty
  - Supraglottoplasty
  - Genioglossal advancement with hyoid myotomy or thyrohyoid suspension
  - Tracheotomy
- In the absence of coindications of recurrent tonsillitis discussed earlier (peritonsillar abscess, significant school absenteeism), observation for at least 12 months may be appropriate due to the lack of available data on performing tonsillectomy prior to 1 year of recurrent tonsillitis. Many patients with recurrent tonsillitis will resolve spontaneously within this time frame.

Discussion

Evidence-Based Medicine Question

Is tonsillectomy an effective treatment for SDB/OSA?

In 2015 Cochrane meta-analyses of the Childhood Adenotonsillectomy Trial (CHAT), Goldstein et al. and Sudarsan et al. found moderate quality evidence that children with mild to moderate OSA benefit from early

adenotonsillectomy in objective quality of life measures and caregiver-reported symptoms and behavior. There was high-quality evidence that adenotonsillectomy improves polysomnographic results. The comparison groups in these studies were watchful waiting or children treated with CPAP. In practice, the success of tonsillectomy is most often measured by reported improvement in symptoms by caregivers. In otherwise healthy children, postoperative PSG is only pursed on the basis of persistent symptoms or moderate to severe pretonsillectomy OSA. Additionally, a postoperative PSG should be repeated in children with obesity, craniofacial anomalies, and neurologic disorders.

Is Tonsillectomy an Effective Treatment for Recurrent Tonsillitis?

Since the introduction and near-universal adoption of the Paradise criteria, there have been many studies conveying the success rate of tonsillectomy for recurrent infectious pharyngotonsillitis. One systematic review of tonsillectomy for recurrent infections found that the frequency of infections was reduced by 43% compared to nonsurgical intervention. A recent Cochrane review found that tonsillectomy reduced the frequency and duration of sore throat in the first year following surgery. The success rate of tonsillectomy for recurrent throat infections depends on adherence to Paradise criteria, because the more relaxed the indications, the lower the benefit.

TABLE 192.4

List of Complications

• Pain • Nausea and vomiting • Poor feeding/dehydration • Electrolyte imbalance • Voice changes • Primary or secondary hemorrhage • Death (aspiration, cardiopulmonary failure) • Post–obstructive pulmonary edema • Laryngospasm	• Airway fire • Condyle fracture, TMJ dysfunction • Subcutaneous emphysema • Dysgeusia/ageusia/phantogeusia • Tongue paresthesia • Grisel syndrome • IJV thrombosis • Vascular injury • Trauma or burns to lips/teeth/gums pharyngeal wall, soft palate

IJV, Internal jugular vein; *TMJ,* temporomandibular joint.

Editorial Comment

I am pleased to write an editorial for this excellent chapter on tonsillectomy because it gives me an opportunity to reflect on my 50-plus years of experience with this procedure. In the early 1960s, I performed tonsillectomy primarily at the Children's Hospital of Pittsburgh, for what I thought were reasonable indications, because at that time there were no published evidence-based indications. Then in 1971, my colleague in pediatrics, Jack Paradise, called me about a child he thought might benefit from the procedure and when he asked my opinion I replied that I wasn't sure. Jack then said, "Let's do a clinical trial," which I gladly accepted. When we met in 1971 to establish the indications to be studied, he suggested seven episodes of throat infections in one year, five or more per year for 2 years, or three or more per year for 3 years. I thought they were too stringent because a third-party carrier had recommended that four episodes in 1 year was an indication. Jack replied that if the stricter indications were effective, then the next step would be to address more moderate rates.

In 1973, we were awarded a grant from the National Institutes of Health (NIH) to study the problem. In 1975, I was asked by the Centurion Society, an otolaryngology society that no longer exists, to convene a workshop on tonsillectomy and adenoidectomy. The deliberations were published but it was received with some derision by those who commissioned it, because our conclusion stated that at that time, the indications were "uncertain." In 1978 the first publication from our NIH-funded trial revealed that undocumented histories where unreliable to warrant tonsillectomy and we strongly recommended that clinical trials were sorely needed to determine strict criteria for indications.

In 1984, our first trial was published confirming that the strict criteria were effective. Then in 2002, the next trial addressed my concerns about children who were only moderately affected, which did not find tonsillectomy to be efficacious.

In 2011 the American Academy of Otolaryngology–Head and Neck Surgery published its Clinical Guideline for Tonsillectomy; this guideline accepted our 1984 indications, which had not been the case before. Then my colleague Jack Paradise called me and said, "Finally, your august Academy accepted our guideline." I replied, "Jack, it only took 27 years for it to sink in, whereas in the 1840s when Ignaz Philipp Semmelweis (1818–65) pleaded with obstetricians to wash their hands before

delivering babies to prevent puerperal sepsis and probable death and it took over 40 years until Lister recommended handwashing before performing surgery. Sometimes it takes medicine a long time to catch on."

I'm proud that the relatively recent dramatic reduction in the frequency of tonsillectomy is due to awareness on the part of physicians and third-party carriers of our guidelines for the surgery when recurrent throat infection is the reason to consider it.

Review Questions

1. Which artery does not typically provide blood supply to the palatine tonsil?

   a. Facial artery

   b. Lingual artery

   c. Ascending pharyngeal artery

   d. **Occipital artery**

   e. Maxillary artery

2. Which item meets the Paradise criteria as an indication for tonsillectomy?

   a. 7 sore throat episodes over 2 years

   b. 3 sore throat episodes in each of last 2 years

   c. 5 sore throat episodes in 1 year

   d. **6 sore throat episodes in each of last 2 years**

   e. 2 sore throat episodes over 1 month

3. Which medication is not recommended for posttonsillectomy pain control?

   a. Acetaminophen

b. **Codeine**

c. Ibuprofen

d. Oxycodone

Laryngomalacia

Prasad John Thottam, and Sukgi Choi

Introduction

Laryngomalacia-associated breathing was first described in 1851 by the French physician Rilliet in a case report of a benign inspiratory noise from an infant. This sound was subsequently termed stridor in 1853 by Rilliet and Barthez in their textbook, *Of Diseases of Children*. It was not until 1897 that the laryngoscopic physical findings associated with this disorder were accurately described in 16 patients by Sutherland and Lack as congenital laryngeal obstruction, while the actual term "laryngomalacia" ("malacia," Greek *malakia*—softening of part of tissue) was not used until 1942 when Chevalier Jackson described this disorder.

The underlying etiology for laryngomalacia remains relatively unknown. The predominant underlying concepts to explain this supraglottic instability are excess redundant mucosa, poor cartilaginous support, and/or abnormal neurologic laryngeal tone.[1] Kletzker observed mucosal hypertrophy in histologic normal supraglottic tissues and proposed that pulsion forces from the back and forth of mucosa on overlying cartilage resulted in hypermobility and redundancy, which then becomes obstructive.[2] The lack of cartilaginous support (chondromalacia) theory has become controversial by histologic studies demonstrating similar cartilage in patients having laryngomalacia when compared to controls.[1,3]

The predominant theory to date is that laryngomalacia may be a result of delayed neurologic function and tone in the supraglottic laryngeal structures.[3] The work by Thompson correlated increased laryngopharyngeal sensory testing thresholds with laryngomalacia severity,[3] while a recent supraglottic histologic study demonstrated increased neural perimeter and surface area innervation by the superior

laryngeal nerve branch of vagus in patients with laryngomalacia when compared to controls.[4] This information supports altered vagal neuronal innervation and stimulation in this patient population.

Laryngomalacia affects approximately 35% to 75% of infants presenting with stridor and is the most common cause of stridor in the pediatric age group.[1] This disorder primarily presents with inspiratory stridor as early as 2 weeks of age, with progressive worsening up to 4 to 8 months and resolution typically by 12 to 18 months without requiring surgical intervention. Respiratory symptoms are often exacerbated with feeding, exertion, and supine positioning. Swallowing dysfunctions (penetration or aspiration) have been reported in up to 88% of patients with severe laryngomalacia.[5] A discoordinated suck, swallow, breath sequence can result in respiratory distress and arrest, insufficient weight gain/failure to thrive, feeding complications, poor quality of life, and high parental anxiety.[6]

Clinically, this condition is often separated into mild, moderate, and severe categories based on feeding and obstructive symptomatology.[3] Mild disease is described as inconsequential intermittent stridor and sporadic feeding difficulties, and moderate disease presents with dyspnea and consistent feeding difficulties.[3] Severe laryngomalacia is present in approximately 20% of infants with stridor and is characterized by recurrent cyanosis, apneic events, and difficulty with feeding, often with associated penetration/aspiration and failure to thrive.[3]

Anatomically, laryngomalacia is described as the collapse of supraglottic tissue with associated inspiratory stridor and upper airway obstruction.[1] This supraglottic dysfunction is primarily represented by prolapse of arytenoid cartilage or redundant tissue (Figs. 193.1 and 193.2), foreshortened aryepiglottic (AE) folds (Fig. 193.3; also see Fig. 193.2), and/or epiglottal prolapse/omega-shaped epiglottis (see Fig. 193.3).[7] This prolapse of tissue causes obstruction of the glottic introitus upon inspiratory associated negative pressure, resulting in airway distress.

First described in 1922 by Iglauer, supraglottoplasty is a generalized term used to describe a surgical technique in which the supraglottic structures of the larynx are altered in a manner to prevent further collapse and subsequent obstruction of the glottic introitus. This technique did not replace the tracheostomy for relief of laryngomalacia

until the 1980s when refined and modernized by Drs. Lane and Seid.

Supraglottoplasty has a reported success rate of over 90% in otherwise healthy children with this disease.[8] Infants with underlying neurologic conditions require surgical intervention at higher rates and have higher failure rates.[9] As high as 70% of neurologically delayed children with laryngomalacia will require revision supraglottoplasty, and up to 60% of supraglottoplasty failures in the neurologically delayed may require tracheostomy.[9]

Today the modern supraglottoplasty is considered the standard of care in the treatment of severe laryngomalacia. This procedure is performed transorally using suspension laryngoscopy and microlaryngeal instruments. It has a high success and a low morbidity rate, making it a first-line option for the otolaryngologist.

Key Learning Points

1. Laryngomalacia is the most common cause of stridor in the pediatric age group.

2. Laryngomalacia is predominately self-limiting, with resolution typically by 18 months of age.

3. Children with laryngomalacia can present with various aerodigestive complaints that can affect overall child health as well as child and parental quality of life.

4. Supraglottoplasty is a surgical technique reserved for severe laryngomalacia and is a safe procedure.

5. Supraglottoplasty is the surgical treatment of choice when conservative therapy fails.

Preoperative

History

1. Complete prenatal and birth history should be obtained:

   a. Were prenatal visits and care completed?

b. Maternal exposure to alcohol, tobacco, drugs, or teratogens

c. Birthing history (complications, cesarean section, vaginal delivery)

d. Full or preterm birth—number of weeks

e. APGAR score

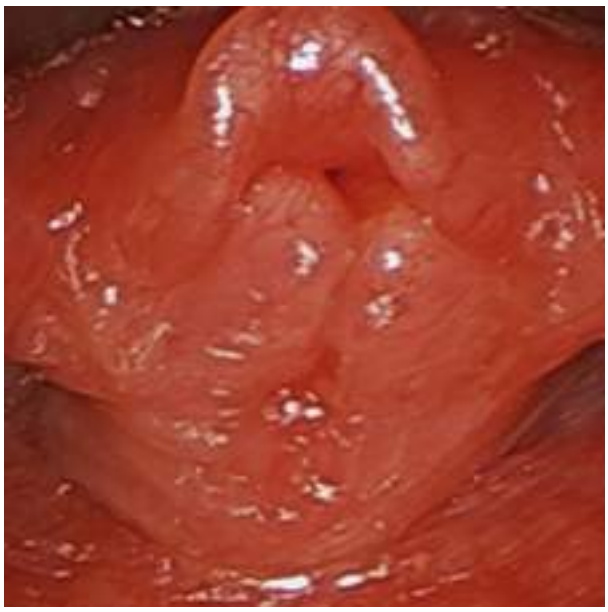

FIG. 193.1 Arytenoid prolapse obstructing the glottis introitus.

FIG. 193.2 Shortened aryepiglottic folds.

f. Intubation history, ICU stay, and any further interventions should be documented.

g. Congenital anomalies and syndromes

1) Estimated in 8% to 20% of patients with laryngomalacia and up to 40% in patients diagnosed with severe laryngomalacia[3,8]

2) Down syndrome is the most common associated genetic disorder.[3,8]

2. Questions directed toward laryngomalacia and airway complaints

a. When did the breathing problems begin?

b. Does the child having any problems feeding?

c. Can you please describe the stridor?

1) Inspiratory: Caused by obstruction above the vocal folds and is most commonly secondary to laryngomalacia

FIG. 193.3 Omega-shaped epiglottis.

2) Biphasic: Caused by obstruction or narrowing at or directly below the vocal folds and is demonstrated in vocal fold

immobility, croup, or subglottic stenosis

3) Expiratory: Caused by proximal and distal trachea pathology and most commonly a sign of tracheomalacia

d. Is patient's breathing or stridor worsened with head or body position?

1) Laryngomalacia-associated stridor and respiratory distress are worsened with head flexion and when lying in the supine position. They are often improved with head extension and prone positioning.[3]

e. Please describe any other situations in which stridor or breathing is worsened?

1) Classically, laryngomalacia-associated complaints are worse with agitation, excitement, and feeding.

f. The presence of GERD and swallowing dysfunction–associated signs and symptoms as well as possible treatments should always be questioned in these patients.

1) Coughing or choking with or after feeds, frequent regurgitation, presence of agitation or back arching when lying supine

3. Medications

a. Antireflux therapy

1) The high incidence of GERD in patients having laryngomalacia suggests that antireflux medication and feeding modification are essential in these patients prior to and after both conservative and surgical therapy.

b. Antiplatelet medications and herbal supplementation associated with increased bleeding should be discontinued prior to surgical intervention.

4. Prior treatment

a. If GERD is present, it should be controlled prior to supraglottoplasty.

1) Gastroenterology consult should be considered if reflux is not controlled with conventional management.

2) Nissen fundoplication can be considered for most severe cases of GERD with laryngomalacia.

5. Family history

a. No significant link to family history of laryngomalacia

Physical Examination

1. General

a. Patient's general appearance and overall well-being should be examined.

1) Patient size and weight for age

b. Patient's respiratory status should be evaluated.

1) How audible and consistent is the stridor?

2) Presence of tachypnea or dyspnea

3) Cyanosis of lips and/or extremities

2. Nasal examination

a. Assess for nasal flaring and proper air movement.

b. Piriform aperture stenosis, choanal stenosis, and choanal atresia should be ruled out by nasal endoscopy or at the minimum cannulation with a 6- or 8-French nasogastric tube.

3. Oral examination

a. Assess for micro- or retrognathia.

1) Patients often will have airway obstruction secondary to retro-displacement of tongue.

b. Assess for macroglossia.

1) Patients can have airway obstruction secondary to enlargement of the tongue.

c. Assess the size of the tonsils.

4. Neck and chest examination

a. Assess for supra-, inter-, and/or substernal retractions.

b. A stethoscope can be placed over the neck, specifically over the supraglottis, glottis, subglottis, and over the thorax to localize stridor and/or wheezing.

c. Assess for pectus excavatum.

1) Defined as concavity of sternocostal cartilage of the anterior chest wall

2) Can be associated with laryngomalacia and primarily seen in moderate and severe cases

5. FFL ± fiberoptic endoscopic examination of swallowing (FEES)

a. Allows for complete evaluation of upper airway

b. Allows for examination of supraglottic structures on inspiration and associated pathology contributing to laryngomalacia

c. GERD changes can be demonstrated by arytenoid, postglottic, and vocal fold edema and/or erythema.

d. FEES can be performed to assess swallowing status.

1) This can be performed with a speech pathologist.

2) Aids in assessment of disease severity and effect on swallowing

3) Allows for assessment and management of safe consistencies for feeding in order to prevent aspiration and penetration

Imaging/Further Diagnostic Evaluation

None

In most situations, clinical history and physical examination provide adequate information for the nonsurgical or surgical management of laryngomalacia.

Polysomnogram—optional

Patients with laryngomalacia often demonstrate associated sleep apnea and hypopnea. A polysomnogram (PSG) allows the physician to document the degree of disease and can provide objective information of apnea status for poor historians—clinical histories that do not correlate with anatomic findings and vice versa. It is also

useful when treating patients with associated comorbidities and/or SALs, as you can objectively follow the course of the disease and response to treatment.

Modified barium swallow (MBS) study—optional

MBS can be used to assess aspiration and penetration status in patients that do not tolerate FEES, have an incomplete FEES, or if the status is questionable.

Indications

1. Severe laryngomalacia

2. Direct laryngoscopy and bronchoscopy with possible supraglottoplasty should be performed on all of the following:[7]

a. Infants with laryngomalacia and severe respiratory distress, failure to thrive, apnea events, or recurrent pneumonia

b. Infants with symptoms that do not match the degree of laryngomalacia noted on flexible fiberoptic laryngoscopy (FFL) to rule out synchronous airway lesions (SALs)

Contraindications

1. Medical comorbidities with increased risk of anesthesia and inability to tolerate spontaneous ventilation

2. Patients currently intubated or tracheostomy tube dependent secondary to ventilator dependence (e.g., bronchopulmonary dysplasia)

3. SALs of higher contribution to airway obstruction

a. SALs are present in 27% of patients with laryngomalacia[10]

Preoperative Preparation

1. Respiratory and swallowing status should be stabilized to the best scenario prior to surgery (supplemental oxygen, hospital admission, thickening of feeds, and nasogastric tube feeding).

2. GERD should be controlled prior to surgery.

3. Discontinuation of any anticoagulants at appropriate time or reversal

4. Complications and indications of the procedure should be discussed at length with responsible individuals.

Operative

Anesthesia

General with spontaneous or jet ventilation

Combustion precautions taken if lasers are used (oxygen <30%)

Positioning

Supine, shoulders elevated, and neck extended with suspension laryngoscope secured on Mayo stand

Medication Prophylaxis

No antibiotics

Dexamethasone 0.5 mg/kg up to 20 mg pre- or intraoperatively

Monitoring

Pulse oximetry

Instruments and Equipment to Have Available

1. Lindholm, Parson, or Dedo suspension laryngoscope

2. Lewy or Benjamin-Parson laryngoscope holder

3. Mayo stand

4. Microlaryngeal cup forceps

5. Microlaryngeal scissors (curved or straight)

6. Zero degree rigid endoscope (4-mm 0 Hopkins rod) or surgical microscope with 400-mm objective lens

7. Optional: CO_2 laser (2 to 4 watts) or KTP laser (1 to 2 watts)

8. Optional: Angled tip laryngeal microdébrider

Key Anatomic Landmarks

1. AE fold

2. Arytenoid cartilage

3. Cuneiform cartilage

4. Corniculate cartilage

5. Epiglottis

Prerequisite Skills

1. Basic microsuspension laryngoscopy

2. Direct laryngoscopy and bronchoscopy

Operative Risks

1. Intraoperative bleeding and airway occlusion
   a. To avoid this, a long laryngeal suction and an appropriate-sized endotracheal tube should be available.

2. Airway fire (when laser or electrocautery is utilized)
   a. Heat-based instruments should only be used when oxygen is below 30%.
   b. Bulb syringe with normal saline should be readily available for copious irrigation.

3. Supraglottic swelling and associated obstruction

a. Ensure good position prior to suspension with release during prolonged cases.

b. Intravenous dexamethasone can be utilized prior, during, and post surgery to decrease swelling.

Surgical Technique

1. Direct laryngoscopy and laryngotracheal anesthesia

   a. Using a laryngoscope in the left hand, the oral cavity is entered from the right side medial to the oral commissure. The tongue is then swept to the left, and the laryngoscope is inserted into the vallecula.

   b. Using an anterior superior motion, the tongue is brought out of view, the epiglottis is moved to the anterior superior position, and all supraglottic structures are now in view.

   c. Once in position, laryngotracheal anesthesia is administered using a composition of topical 4% lidocaine HCl solution.

      1) Lidocaine HCl topical solution should be less than 300 mg lidocaine and should not exceed 4 mg/kg of body weight.

   d. Bronchoscopy should be performed prior to supraglottoplasty in order to rule out SALs.

2. Laryngoscope position and suspension laryngoscopy

   a. Once in proper/desired view of the supraglottic anatomy, the laryngoscope holder is then connected, and the stabilizing arm is lowered onto the Mayo stand to secure the suspended view.

      1) Jet ventilation or passive oxygen can be administered through side ports on certain laryngoscopes.

      2) If a laser is being used, suction can be administered through side ports on certain laryngoscopes for smoke evacuation and oxygen administered should be below 30%.

      3) The microscope should be adjusted to provide proper view of the supraglottic anatomy while allowing adequate distance for operating.

3. Incision of foreshortened AE folds (laryngomalacia type I)

a. Ensure proper view of AE folds.

b. Using cup or grasping forceps, apply adrenaline-saturated pledgets to area of planned incision.

1) The planned incision should be at the anterior aspect of the AE fold where it attached to posterior aspect of the epiglottis.

FIG. 193.4 Incision of the right aryepiglottic fold using microlaryngeal scissors and a microlaryngeal cup-forcep.

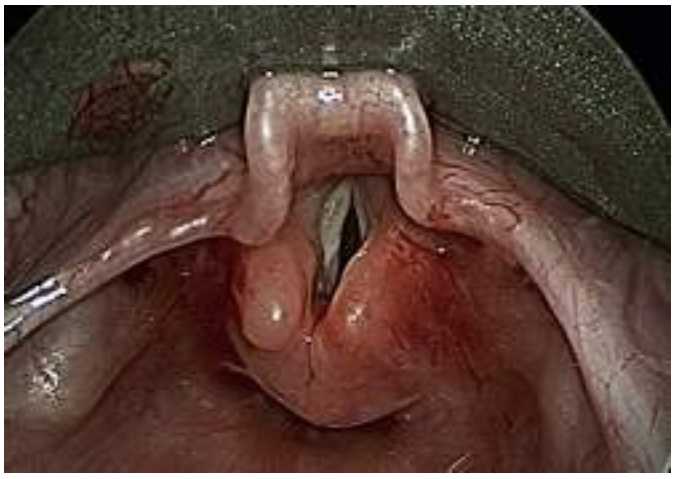

FIG. 193.5 Supraglottis after bilateral incisions of the aryepiglottic folds.

c. Using microlaryngeal scissors, divide the AE fold down to the level of the false vocal fold (Fig. 193.4).

1) Using a two-handed instrumentation technique, the opposing hand can be used to assist in tensing the AE fold mucosa by grasping the mucosa of the ipsilateral posterior arytenoid and

providing opposing posterior force.

d. Control any bleeding with adrenaline-soaked pledgets and microlaryngeal suction.

e. Repeat on the contralateral side.

f. Fig. 193.5: Supraglottis postincision of AE folds

4. Excision of redundant arytenoid mucosa (laryngomalacia type II)

a. Ensure proper view of the arytenoids with focus on the posterior lateral aspects.

b. Using cup or grasping forceps, apply adrenaline-saturated pledgets to area of planned excision.

1) The planned excision should be at the posterior lateral aspect of the superior portion of the arytenoid mucosa.

c. Using microlaryngeal scissors and cup forceps, the redundant mucosa on the arytenoid is removed in a medial to lateral, inferior to superior fashion (Fig. 193.6).

5. Epiglottopexy (laryngomalacia type III)

a. The laryngoscope is positioned to ensure proper view of the lingual surface of the epiglottis and the base of the tongue.

b. Needle-point cautery (CO_2 or KTP laser could also be used) is used to remove mucosa from both the lingual surface of the epiglottis and the base of the tongue.

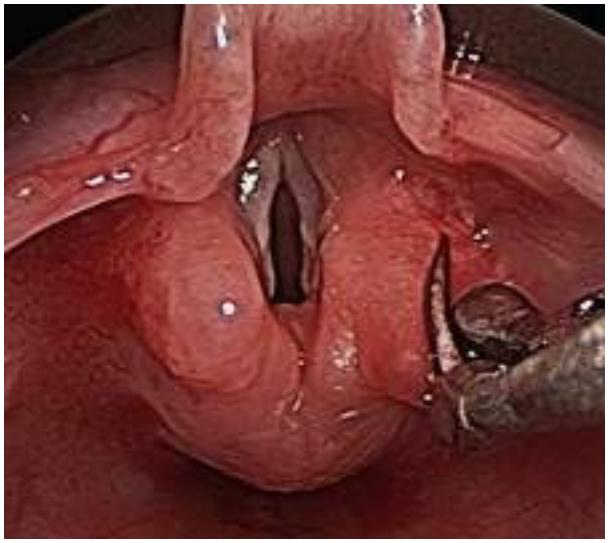

FIG. 193.6 Excision of redundant right arytenoid tissue using curved microlaryngeal scissors and a microlaryngeal cup forcep.

c. Sutures are placed through the superior aspect of the denuded lingual surface of the epiglottis and then through the base of the tongue.

1) For this procedure, 5-0 polydioxanone suture (PDS) on a P-2 needle is used.

d. Knots are secured with an endoscopic knot-pushing instrument.

e. Two to three sutures are usually adequate for desired result.

Common Errors in Technique

1. Inadequate release/incision of AE folds or inadequate excision of redundant mucosa

a. Without proper release and incision down to directly above the false vocal folds, incomplete results can occur.

b. This often requires revision supraglottoplasty.

2. Overly aggressive excision of supraglottic tissue

a. Supraglottic stenosis can occur as a result of overly aggressive excision of supraglottic tissue. This occurs when excision of redundant arytenoid mucosa is performed in a medial direction toward the glottis introitus and/or toward the interarytenoid region.

b. Aspiration or penetration can result from overly aggressive surgery in which the supraglottic mucosa has decreased sensation or too much tissue and associated protective elements are removed.

3. Prolonged suspension

a. Care must always be taken to release the suspension element and ensure that excessive and prolonged pressure are not placed on delicate tissue. When in suspension, check lips, tongue, and supraglottic tissue position.

1) A 20-minute maximum suspension time is often used to prevent pressure necrosis and/or related swelling.

Postoperative

Postoperative Care

1. It is routine for patients after supraglottoplasty to be observed overnight in the intensive care unit (ICU).

2. O_2 level should be monitored using continuous pulse oximetry.

3. Dexamethasone can be administered every 6 to 8 hours for airway edema.

4. Optional: On postoperative day 1, a bedside swallowing evaluation by a speech pathologist can be performed to evaluate safety of oral intake.

5. Patient can be discharged after 24 hours if stable.

Complications

1. Postoperative edema and associated airway obstruction

2. Dysphagia

3. Aspiration or penetration

4. Residual laryngomalacia

5. Supraglottic stenosis

Alternative Management Plan

1. Observation is the most appropriate form of management for the majority of non life-threatening cases of laryngomalacia, as most symptoms will resolve by 18 months of age. During this time, associated factors such as reflux can be managed conservatively.

2. Historically, tracheotomy was the standard therapy for severe laryngomalacia, though this is now only used in as an absolute last resort after failed supraglottoplasty attempts and is primarily performed on children with other comorbidities.

Discussion

Evidence-Based Medicine Questions

1. Are laryngomalacia and gastroesophageal reflux disease related? How do they affect each other?

Gastroesophageal reflux disease (GERD) has been reported in up to 70% of patients with laryngomalacia and has been suggested as a potential causative factor in laryngomalacia exacerbation. GERD prevalence in laryngomalacia may be the result of two distinct factors. The lower esophageal sphincter (LES) is theorized to have similar vagal innervation as the supraglottic and thus decreased tone in children with laryngomalacia. Anatomically, the augmented labored respiratory pattern and increased intrathoracic pressure generated in these patients may encourage extraesophageal reflux. GERD in such situations can result in worsening of laryngomalacia by causing increased edema of the supraglottic tissue and further desensitization.

2. When is supraglottoplasty indicated, and how successful is supraglottoplasty in the treatment of laryngomalacia?

Supraglottoplasty is the mainstay of surgical treatment for laryngomalacia.[1] Though the decision as to who requires surgical intervention is surgeon dependent, absolute indications include severe airway obstruction with witnessed apneas or retractions, cor pulmonale, development of pectus excavatum, and failure to thrive.[1] Relative

indications are aspiration with recurrent pneumonia, weight loss, and difficulty with feeding despite reflux management.[1] In patients with both clinical and anatomic findings consistent with laryngomalacia, supraglottoplasty success rates have been reported to be as high as 94% in otherwise healthy infants.[8] Failure and revision rates are reported to be between 19% and 45% and are directly related to associated comorbidities.[3] Proper parental/guardian education must be performed preoperatively.

3. Does supraglottoplasty increase the risk of aspiration or penetration postoperatively?

A study published in 2009 sought to answer this question.[5] In the study, after supraglottoplasty, no patients demonstrated new onset of aspiration or penetration, while 82% had resolution of their preoperative swallowing dysfunction.[5]

Editorial Comment

Laryngomalacia is the most common cause of pediatric stridor and is a disease that is encountered by all clinicians involved in the care of children. Though primarily self-limiting, the surgical indications for supraglottoplasty have increased over the past decade as more has been learned about this disease and its global effect on the upper aerodigestive system. Laryngomalacia has been demonstrated to be associated with swallowing dysfunction, GERD, OSA, child and caregiver quality of life, as well as more traditional respiratory complaints. Supraglottoplasty is a relatively safe procedure and can improve or resolve all the above ailments when properly performed on indicated children.

Review Questions

1. What is the most common cause of infant stridor?

a. Subglottic stenosis

b. Tracheomalacia

c. **Laryngomalacia**

d. Croup

2. Laryngomalacia primarily presents with what type of stridor?

a. **Inspiratory**

b. Biphasic

c. Expiratory

d. None

3. What are the two most common medical comorbidities associated with laryngomalacia?

a. Asthma and neurologic disease

b. **GERD and neurologic disease**

c. Congenital heart disease and GERD

d. Genetic disorders and congenital heart disease

4. The success rate of supraglottoplasty in uncomplicated patients is approximated as

a. 30%

b. 50%

c. 70%

d. **>90%**

Subglottic Stenosis

Renee E. Park, and Sukgi Choi

Introduction

Subglottic stenosis (SGS) used to be primarily congenital in etiology, and managed conservatively with a tracheostomy tube. Long-term intubation, especially in premature infants, was introduced in the latter part of the 20th century and resulted in increasing rates of acquired SGS, which was associated with worse outcomes as compared with congenital SGS. Laryngotracheal reconstruction (LTR) was introduced in the 1970s, and has expanded to include various open and endoscopic techniques.

The larynx provides several functions, including air transport, phonation, and airway protection during deglutition. As in all surgical intervention, the sequelae of surgery must be weighed carefully, and patient selection is paramount. It is critical to ensure a safe and secure airway. Expansion of a stenotic airway should not come at the cost of dysphonia or dysphagia.

A diagnostic airway endoscopy is required in the evaluation of SGS to assess the location and severity of stenosis, as well as to identify synchronous lesions. Potential causes of airway obstruction must be evaluated, including choanal atresia, piriform aperture stenosis, adenotonsillar hypertrophy, microretrognathia, macroglossia, lingual tonsillar hypertrophy, hypotonia, laryngomalacia, vocal cord paralysis, vascular ring, or tracheobronchomalacia. The Myer-Cotton grading scale is used to describe the severity of SGS (Table 194.1).[1] During endoscopy, a nasopharyngeal and/or tracheal culture can be obtained to test for methicillin-resistant *Staphylococcus aureus* (MRSA).[2] It is important to ensure adequate pulmonary function. An evaluation of swallow function is also recommended with a functional endoscopic evaluation of swallow (FEES) or modified barium swallow (MBS). Esophagoscopy with biopsy

may also be considered to be sure that reflux esophagitis or eosinophilic esophagitis (EE) are not present prior to reconstruction, as they are associated with granulation, restenosis, or failed decannulation.

To ensure a safe airway, prerequisite skills include basic endoscopic airway techniques including suspension laryngoscopy, management of airway foreign bodies, cricothyroidotomy, and tracheotomy. Direct laryngoscopy with microscopic or endoscopic assistance improves visualization and enables photographic documentation. Bronchoscopy can be performed with either a telescope alone or a rigid bronchoscope. The diameter of the telescope alone is smaller than the bronchoscope, limiting tissue trauma. However, the rigid bronchoscope allows for passive oxygen insufflation, suctioning, or other endotracheal manipulations. Close communication with the anesthesiology team is required to ensure safety, since throughout the various portions of the procedures, it may be required to occlude the airway or tolerate intermittent apnea.

TABLE 194.1

Myer-Cotton Subglottic Stenosis Grading System

Grade	Percent of Subglottic Stenosis
I	<50%
II	51%–70%
III	>70% with any detectable lumen
IV	No lumen

A leak (10–25 cm H_2O) should be encountered with the appropriately sized endotracheal tube.[2]

Endoscopic approaches to SGS are most appropriate for low-grade stenosis, and for immature stenosis. Continuous radial expansion (CRE) balloons have replaced traditional rigid laryngeal dilators secondary to decreased shearing trauma. Radial incisions (laser or cold knife) of the stenosis can be considered prior to dilation. Preservation of healthy mucosa between incisions aids in preventing cicatricial scarring. When serial dilations fail in an infant with SGS after prolonged intubation, an anterior cricoid split may be an option to expand the airway enough to allow for extubation and to avoid tracheostomy tube placement. This can be done endoscopically if exposure is adequate,[3] or transcervically, as originally described.[4] However, in higher grade or mature stenosis, LTR or cricotracheal resection (CTR) should be considered.

LTR creates vertical incisions of the anterior and/or posterior cricoid cartilage ring, and augments the diameter of the airway with cartilage grafts. This can be done as a single or multistaged procedure. Single-stage LTR (SS-LTR) requires prolonged sedation and hospitalization, whereas double-stage LTR (DS-LTR) maintains a tracheostomy tube after the first procedure, and places a trans-laryngeal stent that requires subsequent procedures for stent removal and eventual decannulation. DS-LTR is considered for patients with multilevel stenosis, high-grade stenosis, difficult oral intubation due to craniofacial anomalies or cervical spinal disorders, or patients with significant pulmonary disease.

Various cartilage donor sites have been described, but the most common are the thyroid ala or costal cartilage. The thyroid ala is accessible within the surgical site, but is best suited for patients age 2 or younger because of the limited size. When a larger graft, or both anterior and posterior grafts are required, costal cartilage is ideal. Often a single rib is adequate; a second rib is more likely to be required in patients less than 1-year-old due to size.

Restenosis is a risk, and more likely with higher Myer-Cotton grades. An alternative to LTR is partial CTR, in which the anterior cricoid and stenotic laryngotracheal segment is excised, resulting in thyrotracheal end-to-end anastomosis.[5] This is more effective in high grade stenosis, but introduces the risk of dehiscence and increased risk of injury to the recurrent laryngeal nerve (RLN). CTR has been found to be more effective for Myer-Cotton grade 3 or 4, but may not be suitable in a high level or long-segment stenosis. A minimum distance between the stenotic segment and the true vocal folds of 3 mm,[6] and resection length no greater than 30% of the trachea, has been recommended.[7] Tension-free anastomosis is paramount for success.

Operative risks are numerous and include scarring, infection, dehiscence of the anastomosis, recurrent stenosis including posterior glottic stenosis, inability to extubate or decannulate, airway obstruction, pneumonia, pneumomediastinum, hypoxia, and cardiorespiratory arrest. Airway obstruction can occur due to occlusion or aspiration, edema, granulation tissue, or graft dislodgment. The RLN can be injured during dissection or retraction. Dysphonia and dysphagia may occur. Risks of costal cartilage harvest include scarring, infection, and pneumothorax. Postoperative myopathy and opioid withdrawal is common after

prolonged sedation.

Proper postoperative management is critical. Patients who have had minor endoscopic procedures such as dilation may be observed overnight. Procedures that incise the airway and expose cartilage often require prolonged sedation to promote graft healing. Single-stage procedures require intubation for 7 to 10 days, which allows for stenting while securing the airway. During this time, daily sedation holidays with lifting of neuromuscular blockade limits muscle atrophy and atelectasis. Multistaged procedures create immature tracheostoma, with tube change planned on postoperative day 5. Antibiotic prophylaxis and proton-pump inhibitor treatment is recommended during the period of sedation/intubation or until graft mucosalization. Repeat endoscopy is recommended 2 weeks after extubation for single-stage procedures, and 4 weeks after multistaged procedures for removal of the stent.

Several alternative or adjuvant treatments are available. Topical Mitomycin C is an antineoplastic agent that prevents fibroblast proliferation, and has been used in the prevention of granulation and scarring. Several small studies have suggested improved healing, but a randomized control trial failed to demonstrate a discernible benefit.[8] In addition, risks include myelosuppression, pulmonary toxicity, and possible carcinogenicity. Systemic or topical corticosteroids may improve inflammatory stenosis. Perioperative administration of Decadron is helpful as an adjuvant to airway procedures, and can facilitate extubation. Injection of corticosteroids into SGS is also a common adjuvant treatment. Finally, a tracheostomy may be required if the patient is not a candidate or fails reconstruction, or if the patient is unable to be decannulated.

Key Operative Learning Points

- Important goals are to create a safe airway, alleviate airway obstruction, and eliminate tracheostomy tube dependence, while preserving swallowing and phonation.
- Appropriate patient selection, preoperative evaluation, and surgical planning are critical.
- Daily sedation and paralytic holidays after reconstruction are

important to limit muscular atrophy and atelectasis in the perioperative period.

Preoperative Period

History

1. Respiratory history
    a. Stridor, dysphonia, dyspnea, retractions, cyanosis, and respiratory failure
    b. Ventilator dependence
2. Dysphagia history
    a. Dysphagia, coughing or choking with feeds, failure to thrive
    b. Reflux or EE, including symptoms of frequent spit-up, emesis, food impaction, or atopy
3. Neonatal history
    a. History of prematurity, low birth weight, neonatal intensive care unit (NICU) admission
4. Past medical history
    a. Pulmonary status, including a history of chronic lung disease, aspiration, recurrent pneumonia, reactive airway disease.
    b. Comorbidities such as gastroesophageal reflux disease (GERD), diabetes, or congenital syndromes
5. Past surgical history
    a. Prior intubations, prior surgeries, or trauma, including a history of cardiac or thyroid surgery
6. Medications
    a. Reflux medication
    b. Chronic use of steroids

Physical Examination

1. General
    a. Syndromic features
    b. Failure to thrive, low weight
2. Head and neck examination, assessing for upper airway obstruction
    a. Microretrognathia
    b. Macroglossia
    c. Adenotonsillar hypertrophy
    d. Dysphonia
    e. Health of tracheostomy site, if present
3. Respiratory
    a. Respiratory distress, retractions, stridor
    b. Hypoxia, cyanosis
    c. Ventilator dependence
4. Flexible fiberoptic laryngoscopy
    a. Assess vocal fold mobility
    b. Evaluate for synchronous lesions

Imaging

1. MBS or FEES

2. A computed tomography (CT) may be required if laryngotracheal stenosis is too narrow to allow for bronchoscopy,

Indications

1. Endoscopic dilation
    a. Initial
    b. Low-grade stenosis
2. Anterior cricoid split

a. Failed extubation

b. Adequate pulmonary reserve

c. Isolated SGS

3. Posterior cricoid split + graft

a. Posterior stenosis or bilateral true vocal fold paralysis

4. LTR

a. SS-LTR

1) Medium grade stenosis (Grade 2 or 3)

2) No other site of airway obstruction

3) Adequate pulmonary reserve to tolerate prolonged sedation and atelectasis

b. DS-LTR

1) Glottic lesion requiring stenting

2) High grade stenosis (Grade 3 or 4)

3) Complex reconstruction

4) Potentially difficult oral reintubation

5) Family is able to care for a tracheostomy tube or T-tube.

5. CTR

a. High grade stenosis (Grade 3 or 4) with 3 mm distance between the vocal folds and stenosis

b. Tracheal stenosis length ≤30%

c. Failed LTR

Contraindications

1. Active infection such as croup or tracheitis

2. Poor pulmonary function

Relative Contraindications

1. Uncontrolled GERD

2. EE

3. Cardiovascular or endocrine conditions that would preclude corticosteroid administration

4. Chronic respiratory failure and ventilator dependence

5. The lack of a facility adept at postoperative care of critically ill pediatric patients

Preoperative Preparation

1. Diagnostic direct laryngoscopy, bronchoscopy, esophagoscopy with biopsy

2. Treatment of comorbidities such as GERD, EE, dysphagia, or aspiration

3. Endoscopic airway procedures that do not expose cartilage generally do not require antibiotic prophylaxis. An airway procedure with cartilage exposure is considered clean/contaminated, and coverage for oral flora, anaerobes, and pseudomonas is recommended.[9,10] MRSA prophylaxis if positive preoperative culture.

Operative Period

Endoscopic Dilation

1. **Anesthesia**
   a. General mask or IV anesthesia with spontaneous ventilation
   b. Lidocaine is used to topically anesthetize the larynx and trachea
2. **Instruments and Equipment to Have Available**
   a. Laryngoscope
   b. Bronchoscope
   c. Suspension microlaryngoscopy

d. CRE balloon dilator

3. **Surgical Technique**

a. Place the patient into suspension using an appropriately sized laryngoscope.

b. Consider triamcinolone injection within the submucosa of the stenotic segment.

c. Consider radial incisions in the area of stenosis from medial to lateral, avoiding the party wall.

d. Dilate with appropriately sized CRE balloon, holding for 60 seconds or until desaturation. May repeat to achieve effect.

4. **Postoperative care**

a. Consider overnight observation in selected patients.

b. Repeat endoscopy 1 to 4 weeks postoperatively.

Anterior Cricoid Split

1. **Anesthesia**

a. General mask or IV anesthesia with spontaneous ventilation

b. Lidocaine is used to topically anesthetize the larynx and trachea.

2. **Instruments and Equipment to Have Available**

a. Laryngoscope

b. Bronchoscope

c. Suspension microlaryngoscopy

d. CRE balloon dilator

3. **Surgical Technique**

a. Endoscopic

1) Place the patient into suspension using an appropriately sized laryngoscope.

2) Incise the anterior cricoid in the midline using a sickle knife. Counterpressure on the anterior neck is helpful.

3) Dilate with CRE balloon approximately 2 mm greater in diameter than normal subglottic size, holding for 60 seconds or until desaturation.

4) Reintubate the patient orotracheally or nasotracheally

5) Stent for 7 days with endotracheal tube one-half size greater than normal; then wean to extubate.

b. Transcervical

1) Create a horizontal skin incision, and elevate subplatysmal flaps.

2) Divide the strap muscles in the midline, and expose the thyroid and cricoid cartilages and proximal trachea.

3) Sharply incise the anterior cricoid cartilage lamina and the proximal two tracheal rings, and distract apart.

4) Loosely reapproximate the strap muscles, and close the skin over a Penrose drain.

5) The patient is reintubated orotracheally or nasotracheally with one-half size larger than normal endotracheal tube for 7 days, followed by extubation, direct laryngoscopy, and bronchoscopy.

4. Dressings, drains only for transcervical approach

a. Penrose drain removed on POD3

b. Nonocclusive cervical dressing

5. **Postoperative care**

a. Repeat endoscopy 1 week postoperatively, with possible repeat dilation

Cartilage Harvest

1. **Anesthesia**

a. General anesthesia

b. Local anesthetic is injected into the planned skin incisions.

2. **Instruments and Equipment to Have Available**

a. Doyen elevator

b. Soft tissue set

3. **Surgical Technique**

a. Thyroid ala (Fig. 194.1)

1) Expose thyroid lamina from the midline to the oblique line.

2) Incise the superior border of the alar perichondrium.

3) Retract lamina laterally with a skin hook.

4) Incise a fusiform graft, ensuring that the incision is above the true vocal cords.

5) Elevate cartilage off the deep perichondrium with a Cottle elevator.

b. Costal cartilage

1) Size of graft is determined at preoperative endoscopy, or after anterior cricoid incision is created and measurements are taken.

2) Sterilely prepare and drape the chest as a separate surgical site.

3) A skin incision is made along the expected inframammary crease or just overlying the rib. The fifth and sixth ribs are the most common donor sites for costal cartilage, and an incision is commonly created at the anticipated inframammary crease in girls.

4) Muscle is divided using electrocautery until the perichondrium is identified.

5) The intercostal muscles are then dissected off of the perichondrium.

6) A 22-gauge needle is useful to identify the lateral bony-cartilaginous junction.

7) The perichondrium is incised at the superior and inferior border of the rib.

8) A Freer or Cottle elevator is used to elevate the posterior perichondrium off of the cartilage.

9) Once a perichondrial tunnel has been elevated, a Doyen

elevator can be used to elevate the remainder.

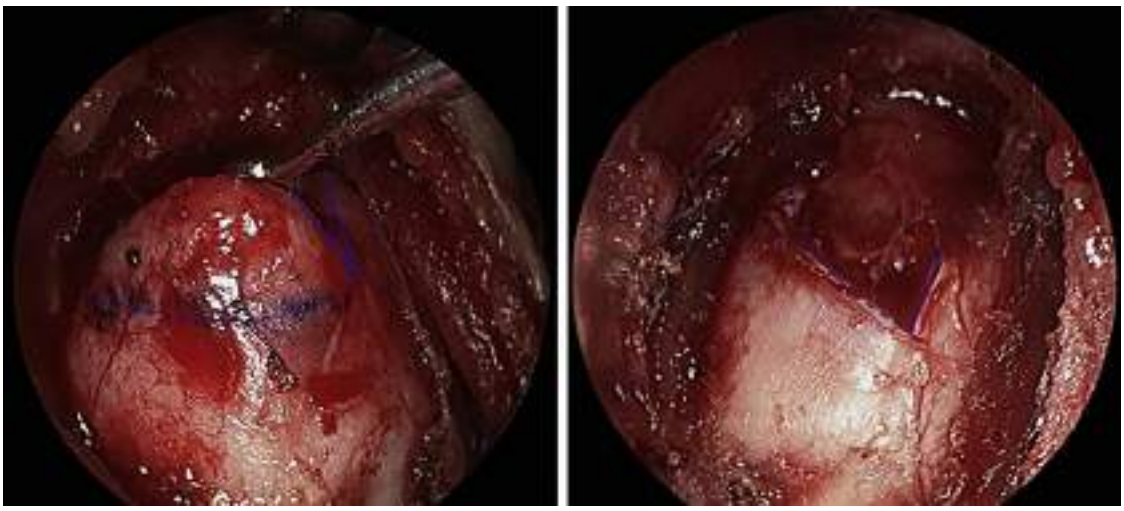

FIG. 194.1 Thyroid ala graft.

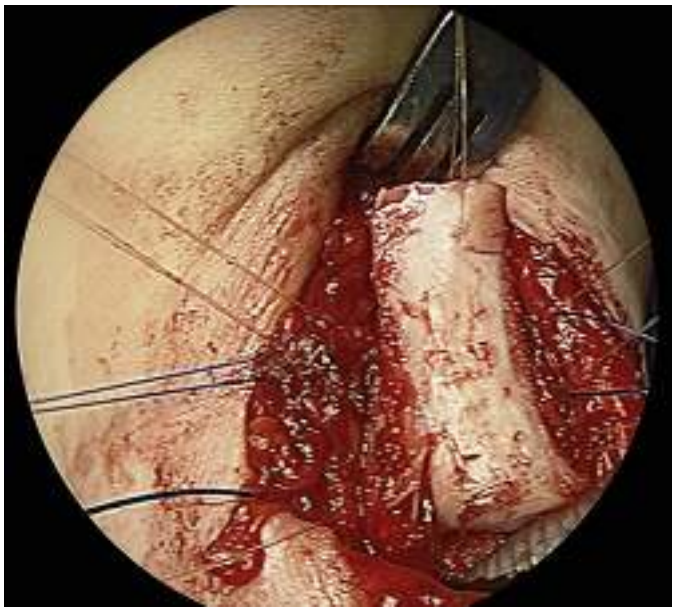

FIG. 194.2 Costal cartilage harvest.

10) Using the Doyen elevator to protect the pleura, the lateral bony-cartilaginous junction is sharply divided.

11) A skin hook is then used to retract the costal cartilage medially, to expose the undersurface of the graft and allow preservation of the perichondrium (Fig. 194.2).

12) The cartilage is then divided at the medial aspect at the appropriate length.

13) A second rib graft may be required.

14) Fill the wound with saline and hold Valsalva to test for an air leak.

15) Place a Penrose drain, reapproximate the muscular layer, close the skin, and apply a sterile dressing.

16) The preserved perichondrium will be used within the lumen of the airway.

17) Shape the cartilage and keep it moist.

a) The anterior graft is shaped with a circumferential shelf of 1 to 2 mm, with a fusiform or hexagonal shape for SS-LTR and a pentagon for DS-LTR (Fig. 194.3).

b) The posterior graft is shaped like a trapezoid to allow the graft to snap into position (Fig. 194.4).

4. Dressings, drains

a. Penrose drain in thoracic incision removed on POD2

b. Sterile dressing over thoracic incision

Posterior Cricoid Split With Graft

1. **Anesthesia**

a. General mask or IV anesthesia with spontaneous ventilation

b. Lidocaine is used to topically anesthetize the larynx and trachea.

c. Local anesthetic is injected into the planned skin incisions.

2. **Instruments and Equipment to Have Available**

a. Laryngoscope

b. Bronchoscope

c. Suspension microlaryngoscopy set

d. CO_2 laser

e. Costal cartilage tray

3. **Surgical Technique**

a. Endoscopic

1) Place the patient into suspension using an appropriately sized laryngoscope.

2) Using the CO_2 laser, divide the posterior cricoid lamina preserving the posterior perichondrial layer.

3) A previously harvested costal cartilage posterior graft is shaped.

4) A subperichondrial pocket is carefully elevated with microlaryngeal instruments.

5) A right-angle clamp is used to distract the cricoid, and the graft is placed into the pocket with perichondrium facing the lumen.

6) The patient is intubated orotracheally or nasotracheally for 7 days.

7) Extubation, direct laryngoscopy, and bronchoscopy is then planned for 1 week after the initial procedure.

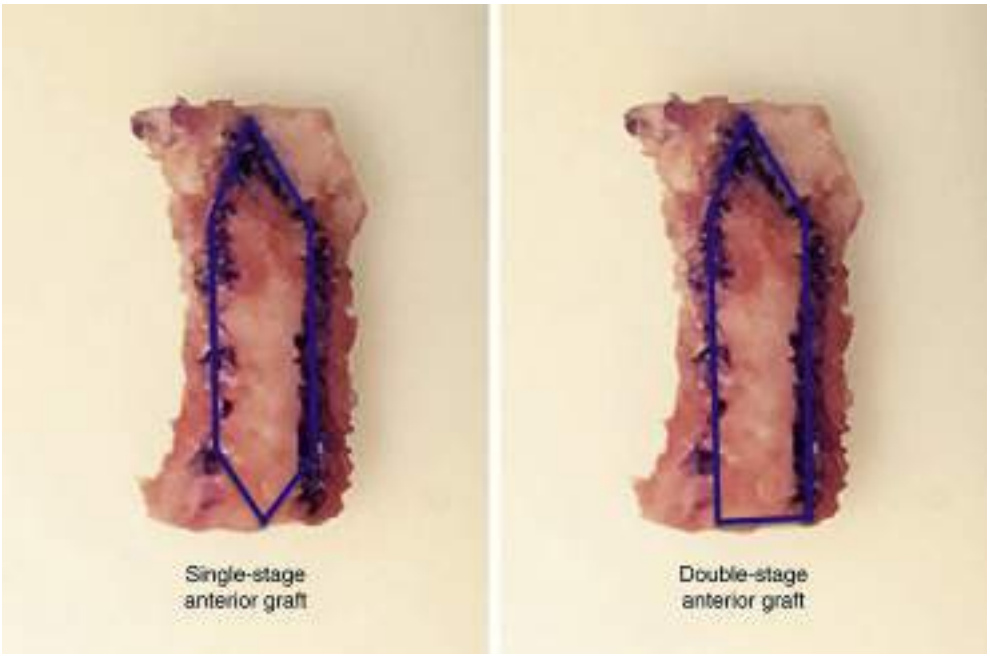

FIG. 194.3 Anterior graft for single-stage and double-stage

laryngotracheal reconstruction.

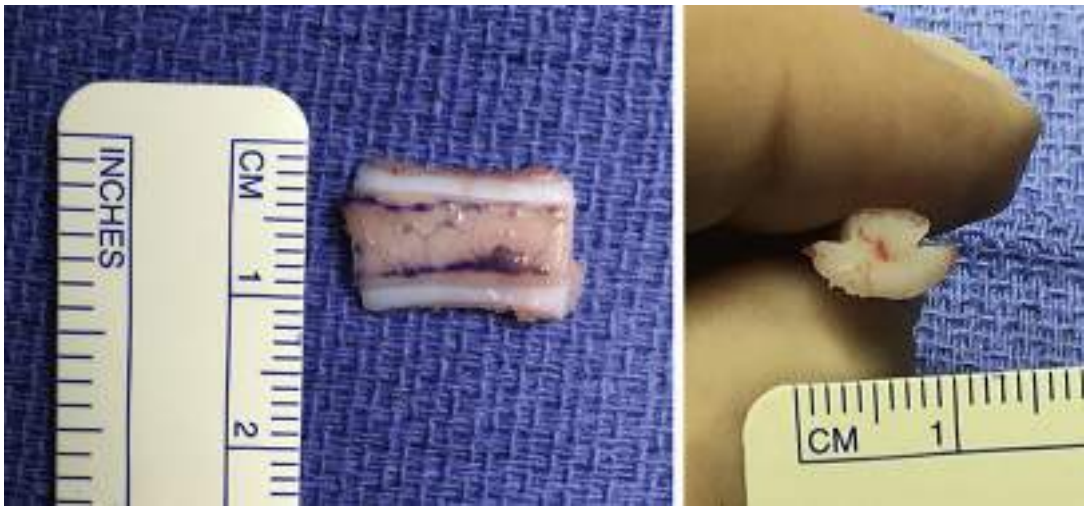

FIG. 194.4 Posterior graft.

b. Transcervical

1) Create a horizontal skin incision and elevate subplatysmal flaps.

2) Divide the strap muscles in the midline, and expose the thyroid and cricoid cartilages.

3) Incise vertically the cricothyroid membrane, and the inferior thyroid cartilage in the midline, taking care to stop inferior to the anterior commissure. Complete laryngofissure is not necessary.

4) If no tracheostomy tube is present, the patient may need to be reintubated through the surgical site at this time. Intermittent apnea may be required to ensure adequate exposure of the posterior cricoid lamina.

5) Divide sharply the posterior cricoid lamina.

6) A previously harvested costal cartilage posterior graft is shaped.

7) A subperichondrial pocket is carefully elevated with a Cottle elevator.

8) The cricoid is distracted, and the graft is placed into the pocket, with the perichondrium facing the lumen.

9) Reintubate the patient orotracheal or nasotracheally.

10) Reapproximate the thyroid cartilage and secure with interrupted 3-0 PDS sutures

11) Loosely reapproximate the straps, and close the skin over a Penrose drain.

12) The patient is intubated for 7 days, followed by extubation, direct laryngoscopy, and bronchoscopy.

4. Dressings, drains

a. Penrose drain in thoracic incision removed on POD2

b. Penrose drain in cervical incision removed on POD3

c. Sterile dressing over thoracic incision

d. Nonocclusive cervical dressing

e. Consider the placement of a postpyloric feeding tube.

5. Postoperative care

a. Repeat endoscopy 1 week postoperatively, with possible dilation

Single-Stage Laryngotracheal Reconstruction

1. **Anesthesia**

a. General inhalation or IV anesthesia via endotracheal tube secured in the existing tracheostomy or in a separately placed inferior tracheostomy incision

b. Local anesthetic is injected into the planned skin incisions.

2. **Instruments and Equipment to Have Available**

a. Laryngoscope

b. Bronchoscope

c. Suspension microlaryngoscopy

d. Costal cartilage set

e. Head and neck set

3. **Surgical Technique**

a. Anterior graft

1) Create a horizontal skin incision through the tracheostoma if a tracheostomy tube is present, or at the inferior border of the cricoid if no tracheostomy tube is present.

2) Elevate subplatysmal skin flaps from the hyoid to the sternal notch.

3) Divide the strap muscles in the midline, and retract laterally.

4) Isolate and divide the thyroid isthmus, exposing the larynx and trachea.

5) Generally the RLNs do not require identification if care is taken to remain on the trachea and limit lateral dissection.

6) Enter the area of stenosis vertically, and extend the incision superiorly through the anterior cricoid. Inspect the lumen of the trachea and extend the incision to the inferior border of the stenosis. If the location and length of the stenosis is difficult to determine externally, perform a bronchoscopy and insert 25-gauge needles to identify the borders of the stenosis.

7) Intubate the patient through the operative site or an inferiorly placed tracheostomy incision.

8) Place the carved anterior graft into position, with the perichondrium facing the lumen.

9) 4-0 PDS interrupted or horizontal mattress sutures are then placed. The needle starts laterally on the outside of the trachea, and advances through the submucosa to the cartilage graft.

a) For a thyroid ala graft, the needle travels under the perichondrium and through the cartilage graft.

b) For a costal cartilage graft, the needle pierces the intersection of the hexagon and the shelf, and comes through the cartilage graft (Fig. 194.5).

10) Circumferential sutures are placed around the graft.

11) The patient is reintubated nasotracheally.

12) The graft is then parachuted into position (Fig. 194.6). The

sutures are then tied over the trachea to ensure maximal vascularity to the free cartilage graft.

13) The wound is filled with saline and a Valsalva is held to identify any leaks around the cartilage graft, which are then reinforced with interrupted 4-0 PDS sutures until no leak is identified.

14) Loosely reapproximate the strap muscles, and close the skin over a Penrose drain.

15) Place a nonocclusive dressing.

b. Posterior graft

1) Start with harvesting the cartilage and dividing the anterior cricoid, as described previously.

2) The patient is intubated, and the posterior cricoid lamina is identified and incised in the midline.

3) Posterior perichondrial flaps are elevated with a Cottle elevator to create a tight pocket.

FIG. 194.5 Suture placement of the anterior graft.

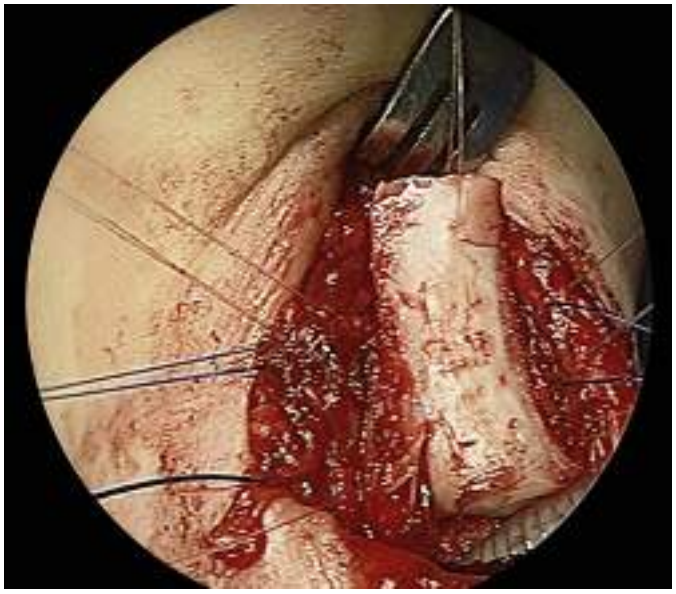

FIG. 194.6 Parachuting of anterior graft into position.

4) Distract the posterior cricoid and place the graft in place. It should snap securely into position (Fig. 194.7).

5) Anterior graft sutures are placed circumferentially.

6) The patient is intubated nasotracheally.

7) The anterior graft is parachuted into position, and the sutures are tied.

8) Close as described previously.

4. Dressings, drains

a. Penrose drain in thoracic incision removed on POD2

b. Penrose drain in cervical incision removed on POD3

c. Nonocclusive cervical dressing

d. Sterile dressing over thoracic incision

e. Consider postpyloric feeding tube placement.

5. **Postoperative care**

a. Prophylactic antibiotics and proton-pump inhibitor administered while intubated.

b. Perioperative steroids will be started on the day prior to extubation.

c. Sedation and neuromuscular blockade for 7 to 10 days, with daily

holidays.

d. Extubate and repeat endoscopy 7 to 10 days postoperatively.

e. Repeat endoscopy 2 weeks later.

Double-Stage Laryngotracheal Reconstruction

1. **Anesthesia**

   a. General inhalation or IV anesthesia via endotracheal tube placed in this existing tracheostomy or in a separately placed inferior tracheotomy incision

2. **Instruments and Equipment to Have Available**

   a. Laryngoscope

   b. Bronchoscope

   c. Suspension microlaryngoscopy

   d. Costal cartilage set

   e. Head and neck set

3. **Surgical Technique**

   a. Start with harvesting the cartilage, and proceed with anterior and posterior cricoid incision and posterior cartilage placement, as described in the SS-LTR section.

   b. After the posterior graft is secured, a laryngotracheal stent is placed.

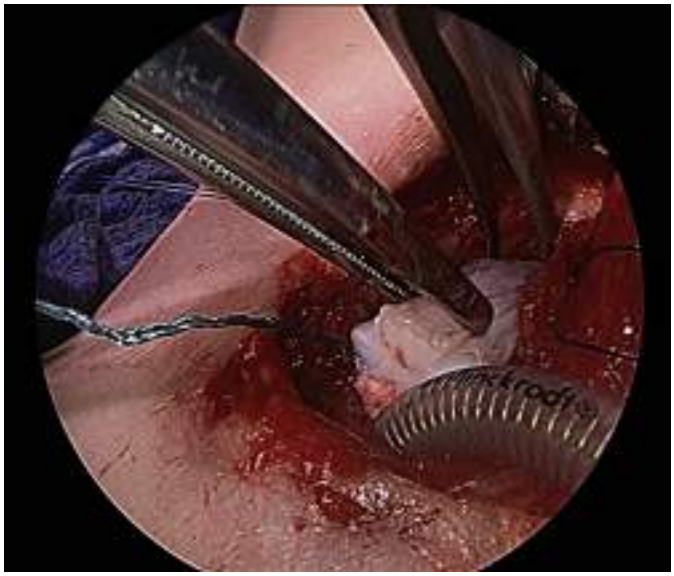

FIG. 194.7 Posterior graft placement.

c. The stent extends from the superior aspect of the stoma to above the glottic aperture (Fig. 194.8). Direct laryngoscopy ensures proper positioning. The stent is then secured into position, either to the superior skin flap, or through the neck using a Silastic button or angiocatheter bolster, and a 2-0 polypropylene suture. The suture and bolster should be easily identified at the time of stent removal.

d. Continue with the anterior graft as described previously. The anterior graft will resemble a house or pentagon.

e. The patient's tracheostomy tube is then placed, and secured in the standard fashion. This is considered a new tracheostomy site, and requires 5 to 7 days to establish a stoma.

f. The straps are loosely reapproximated. The lateral skin edges are then closed in the usual fashion, leaving the tracheostoma open.

4. Dressings, drains

a. Penrose drain in thoracic incision removed on POD2

b. Penrose drain in cervical incision removed on POD3

c. Nonocclusive cervical dressing

d. Sterile dressing over thoracic incision

e. Consider the placement of a postpyloric feeding tube.

5. **Postoperative care**

   a. Prophylactic antibiotics and proton-pump inhibitor are recommended until the tracheostomy tube change.

   b. Sedation and ventilation for 0 to 5 days in pediatric intensive care unit with daily sedation/paralytic holidays

   c. Tracheotomy tube change on POD5–7

   d. Repeat endoscopy and stent removal 4 weeks postoperatively

Cricotracheal Resection

1. **Anesthesia**

   a. General inhalation or IV anesthesia via endotracheal tube placed in this existing tracheostomy or in a separately placed inferior tracheotomy incision

2. **Instruments and Equipment to Have Available**

   a. Laryngoscope

   b. Bronchoscope

   c. Suspension microlaryngoscopy

   d. Head and neck set

3. **Surgical Technique**

   a. Place a bougie into the esophagus to define it.

   b. Create a horizontal skin incision through the tracheostoma if a tracheostomy tube is present, or at the inferior border of the cricoid if no tracheostomy tube is present.

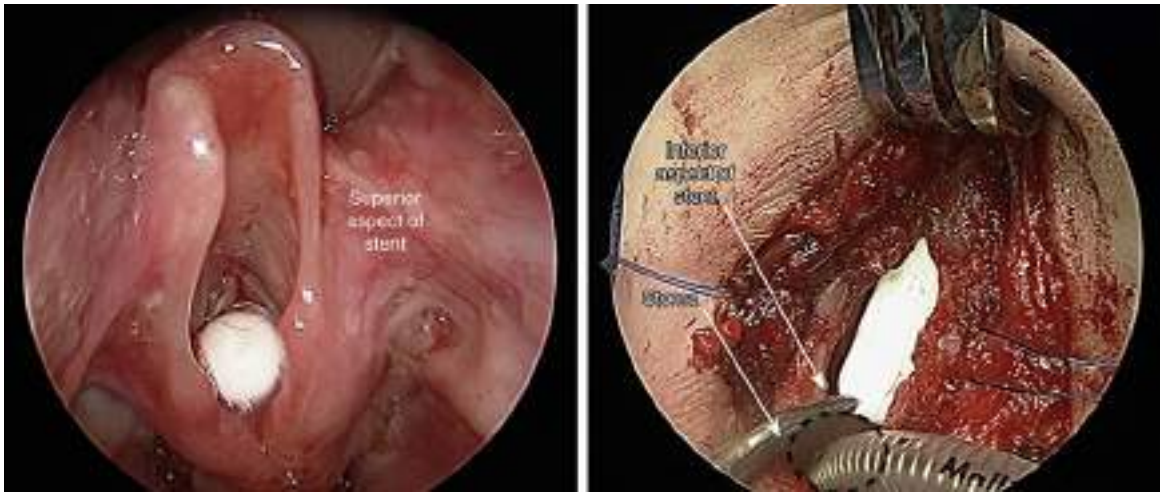

FIG. 194.8 Double-stage laryngotracheal reconstruction laryngeal stent.

c. Elevate subplatysmal skin flaps from the hyoid to the sternal notch.

d. Divide the strap muscles in the midline, and retract them laterally.

e. Isolate and divide the thyroid isthmus, exposing the larynx and trachea.

f. Generally, the RLNs do not require identification if care is taken to remain on the trachea and limit lateral dissection.

g. Using blunt finger dissection, free the inferior anterior tracheal wall from its attachments, with care taken to identify the innominate artery, and avoid overdissection of the lateral borders in order to preserve the vascular supply.

h. Place two 2-0 PDS retaining mattress sutures at the distal end of the trachea to prevent retraction into the mediastinum (Fig. 194.9).

i. Enter the area of stenosis vertically, and extend the incision superiorly through the cricoid. Inspect the lumen of the trachea and extend the incision to the inferior border of the stenotic segment. The tracheostoma should be included in the excision if there are less than two tracheal rings between the stenosis and the stoma.

j. Intubate the patient through the operative site or inferiorly placed tracheostomy incision.

k. Incise the lateral walls of the stenotic segment, ensuring that the incisions are anterior to the tracheoesophageal groove, and remove

the stenotic segment of the trachea.

l. Elevate the cricothyroid muscles off the cricoid from medial to lateral, with care taken to limit dissection at the cricothyroid joint to prevent injury to the RLN.

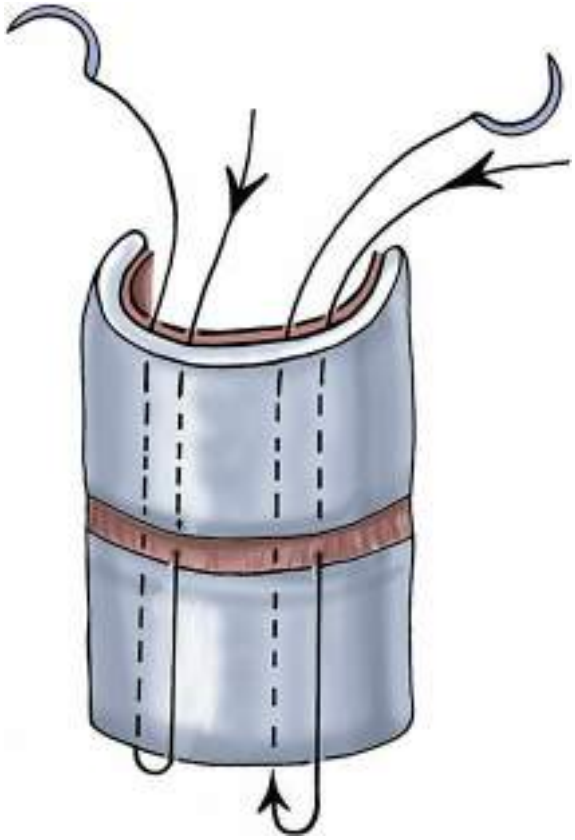

FIG. 194.9 Cricotracheal resection retaining mattress sutures for distal trachea.

m. Incise and remove the exposed anterior cricoid segment, followed by the lateral cricoid cartilage, being sure to preserve the cricothyroid joints.

n. This results in removal of approximately 50% to 66% of the anterior cricoid ring and the stenotic segment of the trachea.

o. Inject the posterior cricoid mucosa with local anesthetic. Incise the mucosa horizontally below the cricoarytenoid joints, and elevate it off of the posterior cricoid using a Freer elevator or a round knife. The membranous wall of the trachea is then carefully dissected off the esophagus, preserving its posterolateral blood supply.

p. If there is prominent stenosis of the posterior cricoid cartilage, use a diamond burr to thin the posterior cricoid lamina.

q. Remove the shoulder roll to eliminate neck extension.

r. Reapproximate the thyroid cartilage and the trachea, using the 3-0 PDS stay sutures securing the lateral thyroid cartilage to the two most proximal tracheal rings, staying submucosal on the intraluminal surface.

s. Consider suprahyoid release if required to relieve tension.

t. Secure the distal trachea to the posterior thyroid and cricoid cartilage using a double-armed 4-0 PDS baseball suture. Alternatively, 4-0 PDS interrupted sutures can be used, with the initial posterior sutures resulting in intraluminal knots. Continue these sutures circumferentially, from the posterior aspect to the lateral trachea. Knots can be placed extraluminally on the lateral and anterior aspects (Fig. 194.10).

u. Reintubate the patient nasotracheally prior to tying the anterior sutures.

v. Consider securing the previously placed retaining sutures around the hyoid as an internal Grillo suture using a Keith needle.

w. If a discrepancy in the diameter of the lumen is noted between the thyroid cartilage and the trachea, an inferior midline thyrotomy can be performed up to the anterior commissure, and a triangular wedge can be created from the anterior trachea to insert into the thyrotomy (Fig. 194.11).

x. Reapproximate the strap muscles loosely.

y. Place Penrose drains over the strap muscles and close the skin.

z. Consider C-collar to prevent neck extension.

4. Dressings, drains

a. Penrose drain removed on POD2

b. Nonocclusive dressing

c. Consider the placement of a postpyloric feeding tube.

5. **Postoperative care**

a. Broad spectrum antibiotics and antireflux medication until extubation

b. Sedation and neuromuscular blockade for 7 to 10 days, with daily holidays

c. Extubate and repeat endoscopy 7 to 10 days postoperatively.

d. Repeat endoscopy 2 weeks postoperatively.

Common Errors in Technique

1. Inadequate evaluation and treatment of comorbidities such as GERD, EE, aspiration

2. Overexposure of lateral laryngeal complex, increasing risk of injury to RLN

3. Injury to true vocal folds during splinting, increasing risk of glottic stenosis

4. Incomplete assessment and treatment of multilevel obstruction

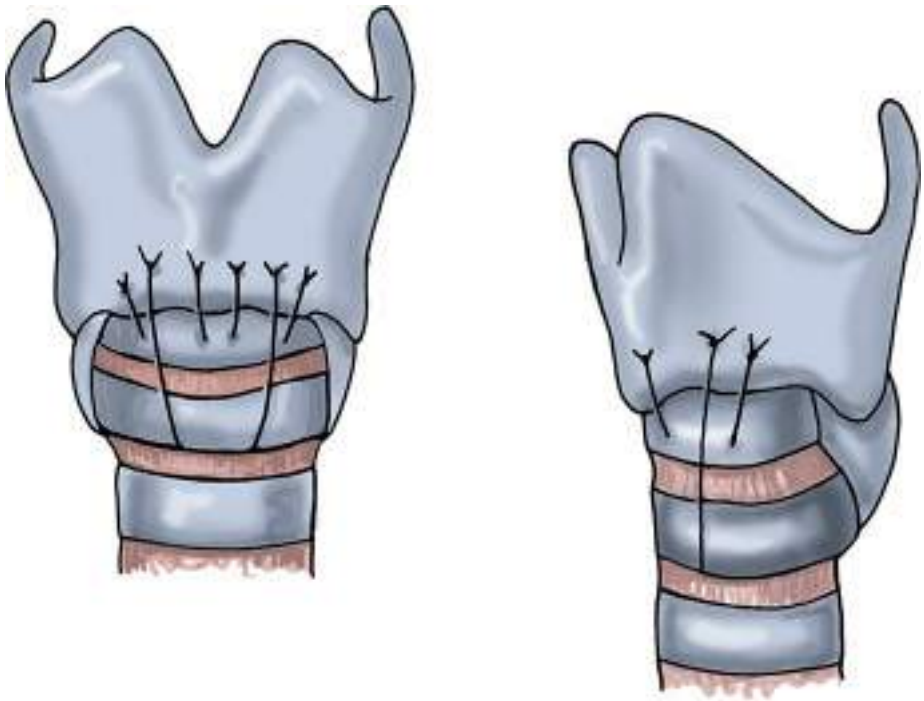

FIG. 194.10 Cricotracheal resection anastomosis.

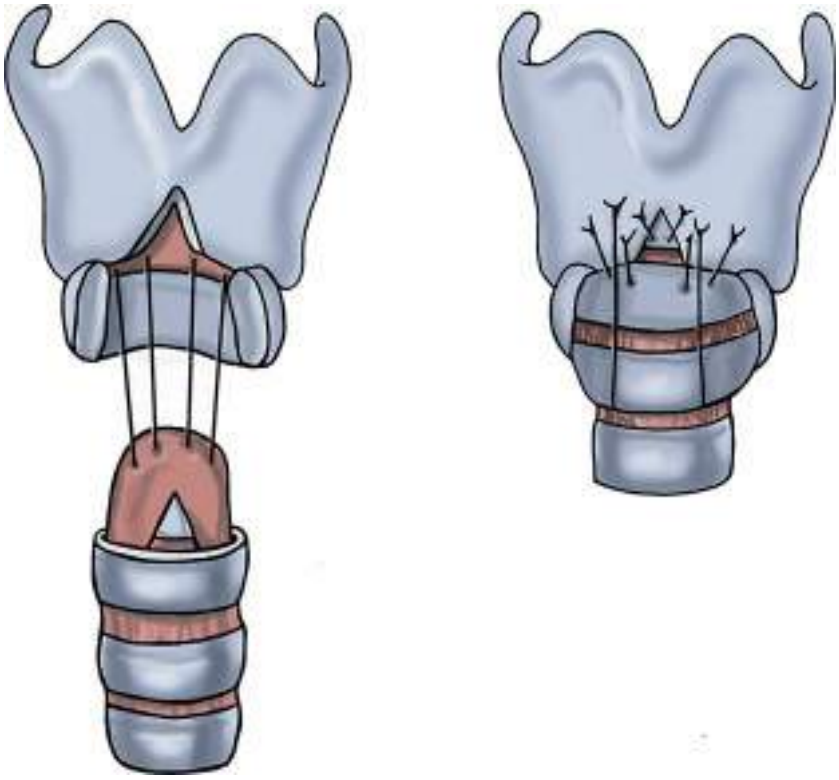

FIG. 194.11 Inferior midline thryotomy with tracheal wedge used to address significant discrepancies luminal diameter in cricotracheal resection.

Discussion

Evidence-Based Medicine Question

Does the choice of antibiotic prophylaxis matter?

A retrospective study of 36 LTR patients demonstrated a significant decrease in perioperative infections complications with the use of clindamycin and either ticarcillin/clavulanic acid or ceftazidime (8%) versus other antibiotics or no antibiotic coverage (50%).[9] MRSA colonization was found in 32.5% of a retrospective cohort of 180 patients undergoing open airway surgery. Previous studies have suggested that MRSA wound infections can severely compromise open airway healing. Those MRSA positive patients who received vancomycin demonstrated the same rate of complications as those who did not test negative for MRSA, and had no MRSA related wound infections postoperatively.[2]

Editorial Comment

Great medical advancements were achieved in the late 20th century, including improved neonatal survival. This was in part due to increase use of prolonged intubation and ventilation. However, iatrogenic SGS became increasingly prevalent, and thus the era of open airway reconstruction began. Due to advances in neonatal airway management, the incidence of iatrogenic SGS has decreased. In parallel, endoscopic surgical techniques improved and have gained increasing popularity. Accordingly, management has trended away from open procedures in favor of minimally invasive approaches when applicable. Endoscopic procedures are associated with lower morbidity and fewer interventions.[10]

Review Questions

1. Indications for a two-stage laryngotracheal reconstruction include all of the following, *except*:

   a. Caretaker ability to care for tracheostomy tube or T-tube

   b. **Low-grade stenosis**

   c. Difficult reintubation

   d. Complex reconstruction

2. Cricotracheal resection is ideally limited to the following condition(s):

   a. At least 3 mm distance between the stenosis and the true vocal folds

   b. At least 1 mm distance between the stenosis and the true vocal folds

   c. Stenosis involving less than 30% of trachea

   d. **a and c**

3. Preoperative assessment includes evaluation for:

   a. Dysphagia

   b. Eosinophilic esophagitis

c. Gastroesophageal reflux

d. **All of the above**

Surgery for Aspiration

Laryngeal Cleft Repair and Laryngotracheal Separation

Bianca Siegel, Franklin L. Rimell, and Sukgi Choi

Introduction

Feeding and swallowing problems are commonly encountered issues in pediatric otolaryngology. The incidence of feeding disorders has been estimated at 25% to 45%; the incidence of swallowing disorders is unknown but is increasing with improved life expectancy of premature babies. Oropharyngeal dysphagia has been estimated to affect up to 85% of children with underlying neurologic disorders.[1] Dysphagia is the result of a problem during one or more of the phases of swallowing: the oral phase, the pharyngeal phase, or the esophageal phase. Of particular concern in children with dysphagia is the presence of aspiration, which can lead to pulmonary complications such as chronic cough or aspiration pneumonia. Pediatric dysphagia is multifactorial in nature, and these children benefit from being evaluated in a multidisciplinary manner.[1,2] Services involved in the care and management of these children include Neurology, Pulmonology, Gastroenterology, and Otolaryngology.

An important part of the complete evaluation for children with dysphagia and suspected aspiration typically includes consultation with an Otolaryngologist. Laryngoscopic examination allows for assessment of any anatomic abnormalities that may contribute to dysphagia. Although the majority of cases of pediatric dysphagia are neurologic in nature,[2-4] there are patients who have certain anatomic abnormalities that may predispose them to aspiration. Patients with posterior laryngeal cleft are a particular subset who may benefit from surgical intervention.

Historically, the incidence of laryngeal cleft has been estimated at approximately 1:10,000 to 1:20,000 newborns.[5] In recent years, however, with increased awareness of milder forms of laryngeal cleft, including mild type 1 cleft such as low interarytenoid height, this entity is being diagnosed more frequently. The most commonly used classification system remains that described by Benjamin and Inglis in 1989.[6] Type 1 clefts are limited to the interarytenoid region and have also been referred to historically as "occult clefts." They are believed to be caused by issues that involve interarytenoid muscular development or lack of normal arytenoid cartilage development that may involve the cuneiform or corniculate cartilage. Type 2 clefts involve the upper portion of the cricoid cartilage, type 3 clefts extend through the entire height of the cricoid cartilage, and type 4 clefts extend into the thoracic trachea. Patients with more severe type 3 and 4 clefts typically present in the first few days of life with significant aspiration or recurrent apneic/hypoxic episodes, whereas patients with milder clefts typically have much milder symptoms, resulting in a delay in diagnosis.

Surgery is the mainstay of treatment for patients with laryngeal cleft. Historically, open approaches via thyrotomy, cricothyrotomy, tracheofissure, and lateral pharyngotomy have been described. With advances in endoscopic instrumentation over the past several decades, an endoscopic approach is generally favored when it is feasible, is widely used for type 1 and 2 clefts,[7-9] and has even been described for certain type 3 and 4 clefts.[10]

Injection augmentation of the interarytenoid region for aspiration in mild posterior laryngeal cleft was first described in 1995 and has been widely used for type 1 clefts since that time. The advantage of injection augmentation for milder clefts is that it can provide a significantly less invasive means of treatment for these patients, also provides clarification of the cleft contribution to the child's dysphagia, and can help guide further management including a possible formal repair.

For children with severe and intractable aspiration despite maximal management of comorbid conditions, laryngotracheal separation provides a last-resort management option.

Key Learning Points

1. Dysphagia and aspiration are commonly encountered problems in pediatric otolaryngology, and a multidisciplinary approach should be employed in the evaluation and management of these patients.

2. Laryngeal cleft is a surgically correctable entity, and surgical management should be considered in symptomatic patients.

3. Surgical management of laryngeal clefts ranges from injection laryngoplasty in mild or uncertain cases, to endoscopic repair in types 1 to 3 and some type 4 clefts, to open repair for more extensive clefts or revision cases.

4. Injection laryngoplasty could be used to help diagnose a type 1 laryngeal cleft when injection is performed with a temporary substance.

5. Laryngotracheal separation may be considered as a last resort for children with intractable aspiration despite maximal management of any comorbid conditions.

Preoperative Period

History

1. Feeding history
   a. What type of diet is the patient currently on?
   b. Is there coughing and choking with feeds? What types of consistencies cause coughing and choking?
   c. Have any dietary modifications been tried? Did this help?
   d. Any difficulty breathing or noisy breathing with feeds?
   e. Is the patient gaining weight adequately?
   f. Any reflux symptoms? Frequent spit up/burps? Excessive vomiting? Nocturnal cough?
2. Respiratory history
   a. Any cyanotic or apneic episodes?
   b. History of pneumonia? Bronchiolitis?
   c. Any history of chronic cough or recurrent croup?

d. Any stridor?

3. Neonatal history

a. History of prematurity?

b. Did the child require admission to the neonatal intensive care unit (NICU)?

c. Any need for respiratory support, including supplemental oxygen, positive pressure support, or intubation?

4. Past medical history

a. Cardiac or pulmonary disease?

5. Past surgical history

a. Intubation for any surgical procedures?

b. History of cardiac procedures?

6. Medications

a. Reflux medications?

Physical Examination

1. General appearance

a. Any abnormal or syndromic features?

1) Opitz syndrome: Laryngeal malformations, pinna abnormalities, cleft lip and palate, hypertelorism, genitourinary abnormalities, other malformations of the ventral midline

2) Pallister-Hall syndrome: Laryngeal cleft, bifid epiglottis, genitourinary malformations, neurologic malformations, and syndactyly

3) CHARGE syndrome: Coloboma, heart defects, choanal atresia, growth and mental retardation, genitourinary malformations, and ear malformations

4) VACTERL association: Vertebral, anal, cardiac, tracheoesophageal, ear, renal, and limb malformations

b. Does the child appear malnourished/failure to thrive?

2. Head and neck examination
    a. Any masses or pits on neck?
    b. Any other midline anomalies such as cleft palate or submucous cleft palate?
3. Respiratory examination
    a. Respiratory distress/stridor
    b. Retractions/nasal alar flaring
    c. Respiratory rate
4. Flexible laryngoscopy
    a. Evaluate both choanae for patency.
    b. Evaluate supraglottis for any significant reflux changes or laryngomalacia.
    c. Examine for any evidence of deep interarytenoid notch or laryngeal cleft, although this is difficult to see on fiberoptic examination alone.
5. Fiberoptic endoscopic evaluation of swallowing
    a. A flexible endoscope is advanced through the nose and the larynx is visualized while the patient is feeding.
    b. Advantages: Allows for evaluation of anatomy and vocal cord mobility, presence of any premature spillage or presence of residue in the hypopharynx following swallow, and presence of supraglottic laryngeal penetration or laryngeal aspiration
    c. Disadvantages: Some discomfort to patient, and some patients may not cooperate with swallowing. Unable to assess the pharyngeal phase of swallow due to white-out. Rarely, may cause laryngospasm or vasovagal reaction

Imaging

1. Modified barium swallow study
    a. Fluoroscopy is performed during feeding of foods mixed with barium contrast material.
    b. Advantages: No significant discomfort, tolerated well by most

children. Allows evaluation of pharyngeal phase of swallowing

c. Disadvantages: Requires exposure to radiation. Unable to directly visualize laryngeal anatomy

d. Posterior pattern of aspiration is suggestive of laryngeal cleft.

2. Chest radiograph

a. For evaluation of aspiration pneumonia when suspected

3. Diagnostic direct laryngoscopy/bronchoscopy

a. Palpate and visualize interarytenoid area (Fig. 195.1) for evidence of type 1, type 2, and type 3 laryngeal clefts on direct laryngoscopy.

Indications

1. Injection laryngoplasty for laryngeal cleft

a. Type 1 laryngeal cleft with symptoms of dysphagia/aspiration

b. Deep interarytenoid notch/low interarytenoid height with symptoms of dysphagia/aspiration

c. Minimal or no improvement following feeding therapy and texture modifications

d. Can also be considered in patients with chronic aspiration and normal anatomy. A recent study evaluated interarytenoid injection for children with chronic aspiration and found that 50% of patients with normal anatomy had improved.

2. Endoscopic repair of laryngeal cleft

a. Symptomatic type 1 or type 2 cleft

b. Certain type 3 and 4 laryngeal clefts, if adequate exposure can be achieved through an endoscopic approach

c. Patients with deep interarytenoid notch/low interarytenoid height who have previously undergone injection with improvement in symptoms and subsequent recurrence of symptoms after injection dissolves

3. Open repair of laryngeal cleft

a. Type 3 and type 4 clefts that are not amenable to endoscopic exposure

b. Type 1 and type 2 clefts that have failed endoscopic management

4. Laryngotracheal separation

a. Reserved for patients with intractable aspiration despite maximal conservative management of aspiration, including food texture modifications, feeding via feeding tube, parenteral alimentation, medical management of reflux disease, Nissen fundoplication, and management of any other comorbidities

Contraindications

1. Injection laryngoplasty for laryngeal cleft and endoscopic repair of laryngeal cleft

a. Presence of concomitant upper airway obstruction. Patients with sites of upper airway obstruction, such as subglottic stenosis or laryngomalacia, in addition to a deep interarytenoid notch or type 1 laryngeal cleft, may develop worsening upper airway obstruction following injection. This must be considered prior to offering injection.

b. Asymptomatic type 1 cleft

2. Open repair of laryngeal cleft

a. If endoscopic repair is feasible, it should be used as the first-line approach.

b. No oth er contraindications

Operative

Surgical Technique

Laryngeal Cleft Injection

1. Anesthesia

a. Spontaneous ventilation is ideal.

b. Apneic technique is also acceptable if spontaneous ventilation cannot be achieved.

c. No antibiotics needed

d. Consider an intraoperative dose of steroids.

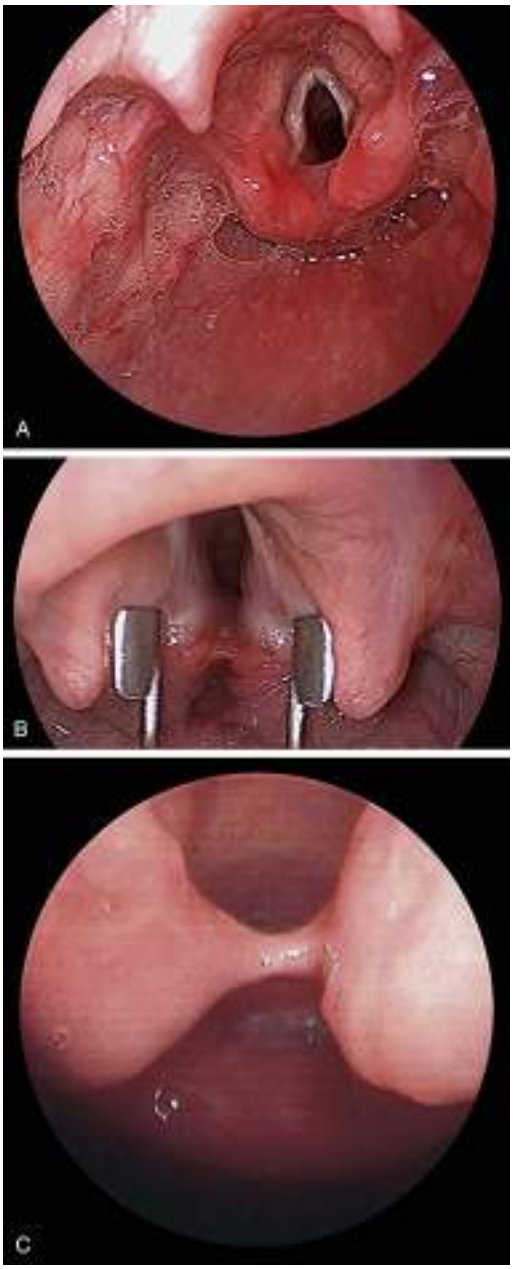

FIG. 195.1 Laryngeal cleft.

A, Type 1 laryngeal cleft, which extends to but not beyond, the level of the vocal cords. **B,** Type 2 laryngeal cleft, which extends inferior to the level of the vocal cords

into the cricoid cartilage but not through the cricoid cartilage. **C,** Type 3 laryngeal cleft, which extends all the way through the cricoid cartilage.

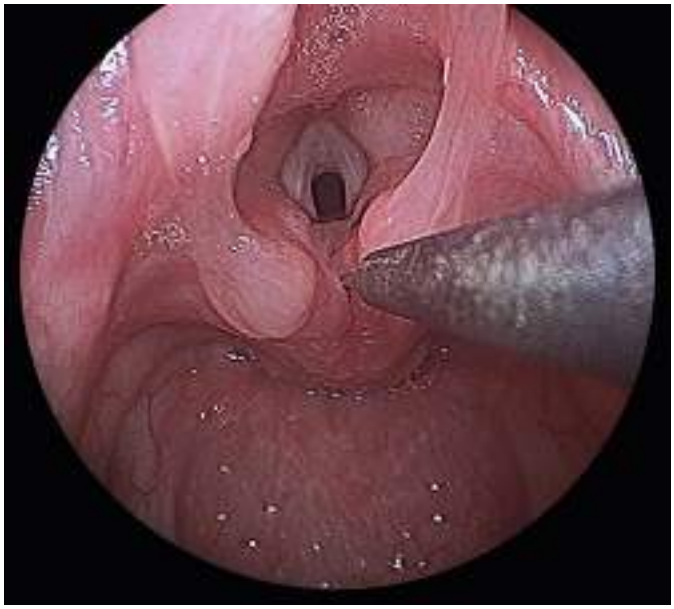

FIG. 195.2 Laryngeal cleft injection.

The patient is placed in suspension and the postcricoid area is visualized. The needle is inserted with the bevel facing posteriorly, and the injection material of choice is injected until the notch visibly fills in (approximately 0.2 cc).

2. Positioning
   a. Supine, with suspension microlaryngoscopy setup
   b. Shoulder roll for neck extension if needed for exposure
3. Instruments/equipment to have available
   a. Microlaryngoscopy set with endoscopic needle
   b. Injection material of choice (Radiesse, Prolaryn, Gelfoam, etc.)
   c. Suspension arm for laryngoscope
   d. Microscope or 0-degree telescope for visualization
4. Technique

a. Load and prime the needle with injection material.

b. Under direct visualization, insert the needle into the apex of the cleft with the bevel aimed posteriorly (Fig. 195.2).

c. Inject until the notch/cleft has been visibly reduced, usually approximately 0.2 cc.

d. Consider injection of the medial surface of each arytenoid around the surface of the corniculate cartilage, approximately 0.1 cc per side.

5. Common errors in technique

a. Poor exposure of interarytenoid area

b. Overinjection with infiltration of injection material into the subglottis or cricopharyngeal surface, which can potentially cause airway compromise or dysphagia

6. Postoperative care

a. Overnight admission with airway monitoring

b. Consider steroids if there is any concern regarding the airway.

c. After awakening from anesthesia, consider clinical speech evaluation to assess swallow prior to resuming oral feeds.

d. Outpatient follow-up with an Otolaryngologist (ENT) and speech; repeat modified barium swallow study (MBS) to assess response to the injection

7. Complications

a. Airway compromise

1) This can occur due to postoperative edema as a result of manipulation or injection that infiltrated the subglottis.

2) It is important to aim the bevel of the needle posteriorly during injection to avoid infiltration into the airway and to carefully watch the airway during injection to determine if the injection material is causing a narrowing of the airway.

b. Persistent aspiration

Endoscopic Repair of Laryngeal Cleft

1. Anesthesia
   a. Spontaneous ventilation
   b. Requires careful titration of intravenous anesthetic to maintain spontaneous ventilation for up to 30 to 40 minutes
   c. If a laser is being used, room air must be employed during laser use.
   d. No antibiotics are needed.
   e. Intraoperative steroids should be given.
2. Positioning
   a. Supine, with suspension microlaryngoscopy setup
   b. Shoulder roll if needed for suspension
3. Instruments/equipment to have available
   a. Standard microlaryngoscopy set, including vocal cord spreader, which may be helpful to visualize the entire depth of the cleft
   b. Suspension arm for laryngoscope
   c. Microscope or 0-degree telescope for visualization
   d. Endoscopic needle driver and knot pusher
   e. Multiple 4.0 polydioxanone sutures (PDSs) on a P2 needle
   f. CO_2 laser, if using
4. Technique
   a. Incise the cleft to create a laryngeal flap and an esophageal flap (Fig. 195.3A).
      1) Can be done using either a laser or sickle knife
      2) If using a knife, consider applying afrin pledgets prior to incision for hemostasis.
   b. Use endoscopic scissors to ensure adequate depth of incision and to develop laryngeal and esophageal flap.
   c. Suture the left esophageal flap to the right esophageal flap, using an endoscopic needle driver and 4.0 PDS suture on a P2 needle. This may require use of the vocal cord spreader for visualization (see Fig. 195.3B).

d. Suture the left laryngeal flap to the right laryngeal flap using an endoscopic needle driver and 4.0 PDS suture on a P2 needle.

1) Buried knot on laryngeal side: Avoid suture material that contacts the laryngeal mucosa because this can be very irritating.

e. May require multiple sutures on either side, depending on the depth of the cleft. Completed cleft repair is shown in Fig. 195.3C.

5. Common errors in technique

a. Inadequate depth of incision

b. Excessive manipulation of tissues resulting in significant airway edema

c. Loosely tied suture

6. Postoperative care

a. Overnight admission to intensive care unit for airway observation

b. Perioperative steroids for 24 hours

c. Consider overnight intubation only if there are concerns with the degree of potential airway edema at the end of the procedure.

1) Avoid nasal or oral feeding tubes during intubation to prevent bilateral pressure on the surgical site in the immediate postoperative period.

d. Perform a speech/swallow evaluation prior to initiating oral feeding.

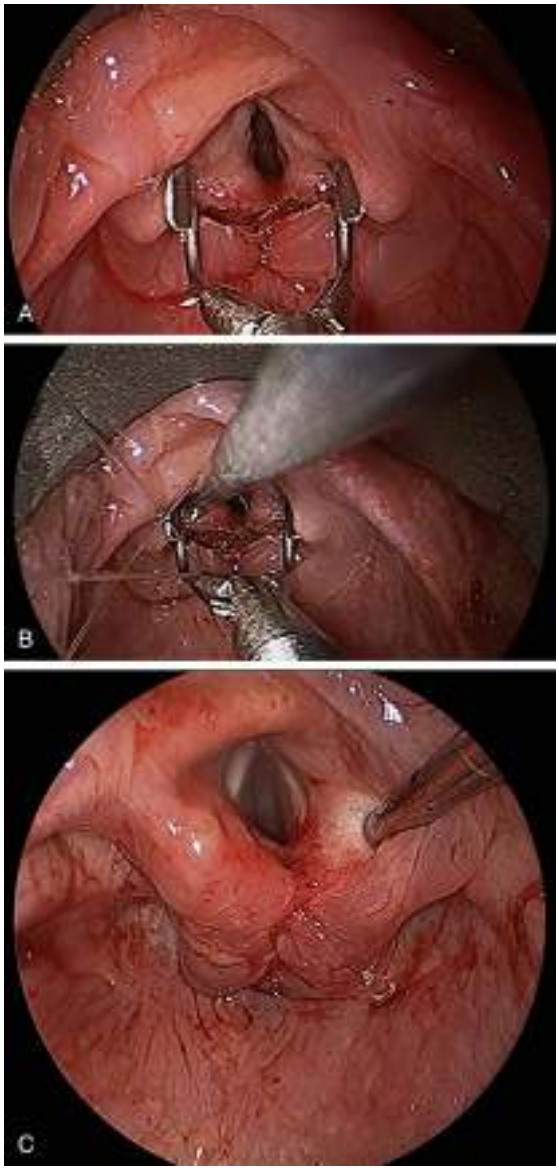

FIG. 195.3 Endoscopic repair of laryngeal cleft.

A, An incision has been made using a CO_2 laser, resulting in an anterior laryngeal flap and a posterior esophageal flap. **B,** Endoscopic suture technique, using a vocal cord spreader for improved visualization. **C,** Completed cleft repair.

e. Discharge on postoperative day 1 if there is no respiratory distress or oxygen requirements overnight and if tolerating oral feeds well.

f. Follow up with ENT and speech; repeat MBS to assess any residual aspiration.

7. Complications

a. Airway compromise

1) More common than in laryngeal cleft injection, due to longer operative time

2) Try to avoid prolonged operative time.

3) Routine administration of steroids

4) May require overnight intubation if there is a significant amount of airway edema at the end of the case

b. Breakdown of repair

1) Avoid esophageal feeding tube if patient requires intubation to prevent bilateral pressure on surgical repair.

2) Avoid exposed suture tails on the laryngeal surface to prevent irritation/cough, which may contribute to breakdown.

c. Persistent aspiration

1) Identified on follow-up MBS

2) Consider breakdown of repair, if a persistent posterior pattern of aspiration is visualized.

3) Consider concomitant neurologic issues causing aspiration.

d. Posterior glottis stenosis

Open Repair of Laryngeal Cleft

1. Anesthesia

   a. General anesthesia, intubated

   b. Broad-spectrum antibiotics

2. Positioning

   a. Supine

   b. Shoulder roll for neck extension

3. Instruments/equipment to have available

   a. Standard head and neck tray

   b. Suture: 4.0 vicryl or PDS

4. Technique

a. Horizontal skin incision in the anterior neck, with dissection of subcutaneous tissues

b. Divide the strap muscles in the midline and retract laterally. Divide the thyroid isthmus if needed for exposure.

c. Dissect superiorly to expose the cricoid and thyroid cartilage.

d. Open the airway by incising the cricoid cartilage and thyroid cartilage vertically in the midline. Extend inferiorly to include tracheal rings as needed for exposure of the cleft. Extend superiorly up to but not through the anterior commissure (Fig. 195.4A). May need to divide the anterior commissure if exposure of the cleft is limited

e. Retract the airway laterally for exposure of the cleft.

f. Incise the cleft bilaterally from the inferior aspect of the arytenoids to the apex of the cleft. Dissect to create an anterior laryngotracheal mucosal plane and a posterior pharyngoesophageal mucosal plane. Use an otoscopic round knife or small iris scissors to help establish planes (see Fig. 195.4B).

g. Closure of the posterior plane

    1) Approximate using interrupted sutures, starting at the apex and moving superiorly toward the arytenoids (see Fig. 195.4C).

    2) Avoid excess tension by ensuring adequate submucosal dissection.

h. Place an interposition graft if desired.

    1) Costochondral cartilage, fashioned in a similar manner as a posterior cartilage graft in laryngotracheal reconstruction

    2) Lateral edges are notched to fit between the residual cricoid ring for stability, and particular attention is paid to ensure that the superior height of the graft is near the aryepiglottic folds (see Fig. 195.4D).

i. Closure of anterior plane

    1) Close laryngotracheal mucosa using simple interrupted sutures, starting at the apex of the cleft and extending superiorly.

    2) Ensure that sutures are buried, with no exposed suture material

in the airway (see Fig. 195.4C).

j. Close the anterior laryngeal incision using simple interrupted sutures.

k. Close skin and strap muscles, leaving a Penrose drain in place.

l. Consider leaving the patient intubated for 2 to 5 days when laryngeal edema with potential airway obstruction is present to avoid the need for reintubation.

5. Common errors in technique

a. Inadequate exposure of the cleft: Make sure to extend the incision adequately superiorly and inferiorly to allow adequate visualization. This may require a laryngofissure. Could also consider placing superior-most sutures endoscopically if needed to avoid laryngofissure

b. Inadequate closure: Ensure meticulous closure of posterior and anterior layers.

c. Leaving exposed suture on tracheal side of repair

6. Postoperative care

a. Admit to the intensive care unit.

b. Consider keeping intubated for 2 to 5 days, if concerned about airway edema.

1) For milder clefts or minimal airway edema, extubate in the operating room.

c. Remove the Penrose drain after 24 to 48 hours.

d. Consider broad-spectrum perioperative antibiotics.

e. Consider reflux medications while intubated.

f. Consider peri-extubation steroids if the patient remains intubated.

g. Feeding

1) For patients with a g-tube, feed via g-tube in the postoperative period, and consider a trial of PO (by mouth) feeds 1 week postoperatively.

2) For patients without a g-tube, place a small-caliber feeding tube

for postoperative feeding if patient remains intubated. Following extubation, consider a clinical feeding trial with thickened feeds versus a modified barium swallow study.

h. Perform follow-up endoscopy 10 to 14 days postoperatively to evaluate the repair and evaluate for evidence of residual tracheoesophageal fistula.

7. Complications

a. Tracheoesophageal fistula

b. Breakdown of surgical repair with residual cleft

1) Consider revision surgery with interposition material such as sternocleidomastoid muscle flap or temporalis fascia.

c. Airway granuloma: Avoid exposed suture material in the airway; tie all knots on the esophageal side.

d. Blunting of anterior commissure

Laryngotracheal Separation

1. Anesthesia

a. General anesthesia; ventilate via endotracheal tube or tracheostomy tube (if patient has a trach)

b. Broad-spectrum antibiotics

2. Positioning

a. Supine

b. Shoulder roll for neck extension

c. Prep and drape neck similar to tracheostomy.

3. Instruments/equipment to have available

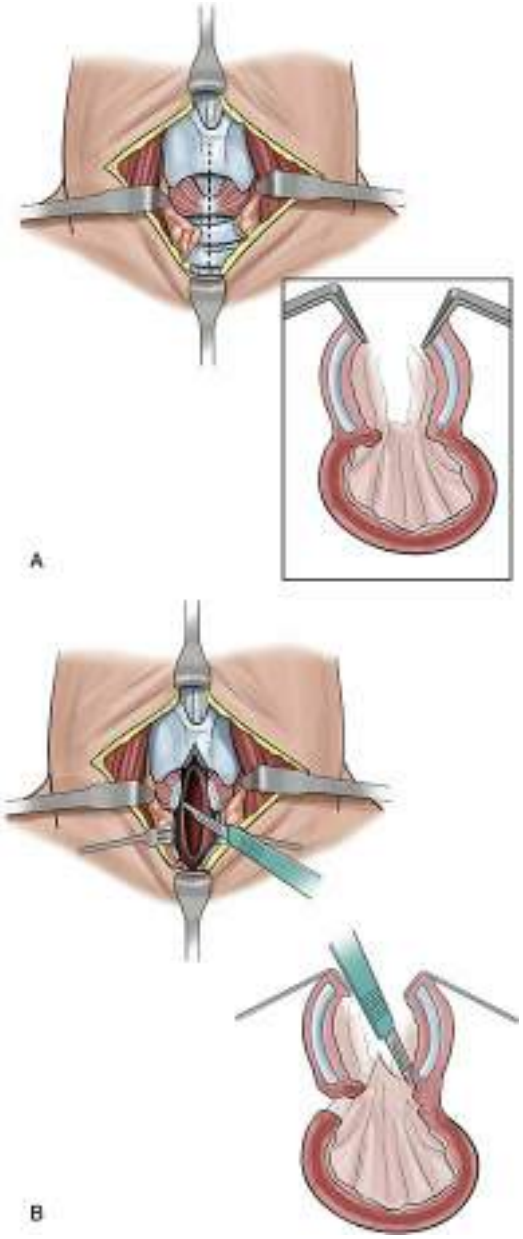
a. Standard head and neck set

b. Penrose drain

c. Suture: Nonabsorbable sutures such as silk, nylon, or prolene for stump closure and stoma maturation

4. Technique

a. Horizontal skin incision that incorporates the tracheostomy stoma if present



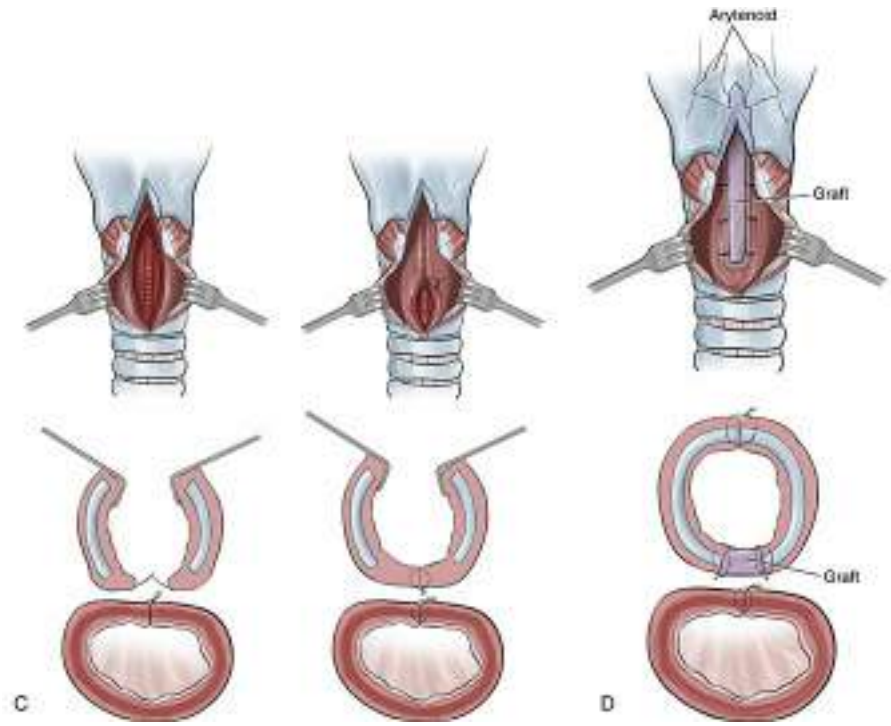


FIG. 195.4 Open repair of laryngeal cleft.

A, Exposure. Tracheal wall, cricoid cartilage, and inferior half of the thyroid cartilage are incised and opened. **B,** The cleft is divided into two separate layers: The anterior layer will become the posterior tracheal wall, and the posterior layer will become the anterior esophageal wall. **C,** Closure of two separate layers with sutures. The tracheal suture knots must face posteriorly, away from the airway. **D,** Repair with interposition cartilage graft.

b. Divide the strap muscles in the midline and retract laterally.

c. Divide the thyroid isthmus.

d. Identify the site of laryngotracheal separation: This should be approximately between the level of the 3rd and 4th tracheal rings or at the site of the tracheostomy stoma.

e. Expose the trachea laterally, taking care to dissect immediately adjacent to the trachea to avoid injury to the recurrent laryngeal nerves.

f. Transect the trachea and place the endotracheal tube into the distal trachea for the remainder of the procedure.

g. Carefully divide the posterior tracheal wall, taking care not to enter the esophagus.

h. Once the trachea has been transected, dissect it free inferiorly and

superiorly.

i. Close proximal stump.

1) Incise the fascia to expose the inferior-most ring in the upper stump. Dissect the ring free and remove the cartilage, keeping the underlying mucosa intact (Fig. 195.5A).

2) Divide the second-to-last ring anteriorly to allow the ring to collapse on itself and reduce tension on the mucosal closure.

3) Close the mucosa in a running inverting fashion similar to a pharyngeal closure in laryngectomy (see laryngectomy) (see Fig. 195.5B).

4) Reinforce closure using additional interrupted suture through the divided tracheal ring.

j. Form stoma.

1) The distal trachea is brought to the skin, and a stoma is formed similar to a laryngectomy stoma (see Fig. 195.5C).

2) Use half mattress sutures to mature stoma to the skin.

k. Close the remaining incision laterally using running closure. Leave the Penrose drain in place. See Fig. 195.5D for a schematic that shows the final result.

l. Remove the endotracheal tube and place the tracheostomy tube into the airway.

5. Common errors in technique

a. Inadequate mucosal closure of the proximal stump, resulting in fistula

b. Excessive dissection laterally, resulting in damage to recurrent laryngeal nerves

6. Postoperative care

a. Admit to the intensive care unit, and keep sedated and comfortable for the first several days.

b. Continue broad-spectrum antibiotics for 5 to 7 days.

c. Remove the Penrose drain after 24 to 48 hours.

d. May resume oral feeds as soon as tolerated by the patient, as early as postoperative day 3. Some patients will require enteral feeds due to their neurologic condition.

e. Routine stomal care, with daily cleaning and débridement of stoma

f. Must communicate the nature of the surgery to other care providers, because the patient is now no longer orally intubatable. We recommend placing a sign over the bed that identifies the patient as a "total neck breather" to remind other caregivers that the patient's only airway is the stoma.

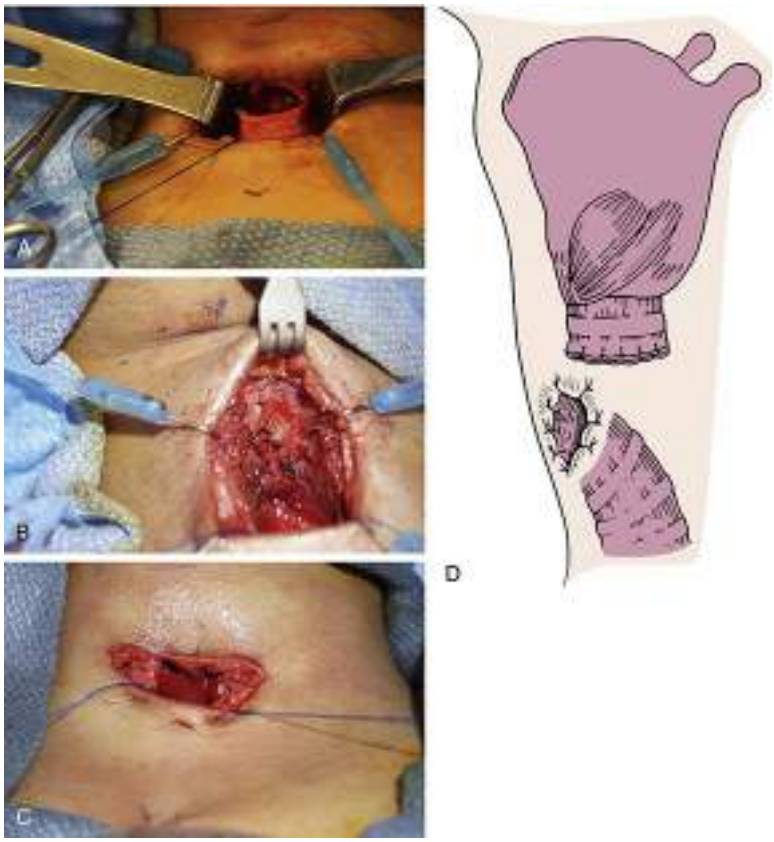

FIG. 195.5 Laryngotracheal separation.

A, After the trachea has been divided, the lowest ring on the superior part of the trachea is removed to provide adequate mucosa for stump closure. **B,** The mucosa is closed in a running inverting fashion. **C,** Appearance of the stoma. **D,** Laryngotracheal separation. The proximal trachea is closed as a blind pouch, and the distal trachea is brought to the skin and a stoma is formed.

7. Complications

   a. Tracheocutaneous fistula: Usually secondary to difficulty closing the proximal tracheal stump

   b. Dysphagia: Can be a complication of the procedure or may be due to the underlying neurologic disease. Patients may require enteral nutrition.

   c. Tracheoinnominate fistula is often fatal.

Discussion

Evidence-Based Medicine Question

What is the difference between a type 1 laryngeal cleft and a deep interarytenoid notch, and should they be managed differently?

Historically, type 1 laryngeal cleft has been described as an absence or hypoplasia of the interarytenoid musculature, resulting in a cleft that can extend as far inferior as the level of the true vocal cords. However, a superior limit for type 1 laryngeal cleft has not been described. Therefore, although historically a diagnosis of type 1 laryngeal cleft was reserved for patients who had a cleft extending to the level of the true vocal cords, many patients are now being diagnosed who have a cleft that is deemed deeper than "normal" but does not extend all the way to the level of the true vocal cords. The terms *deep interarytenoid notch* and *type 1 laryngeal cleft* have been used interchangeably to describe this entity.

In recent years, the incidence of type 1 laryngeal cleft has increased significantly, likely due to increased awareness and increased diagnosis of the more subtle clefts. Even among patients with more subtle clefts, they often respond favorably to injection augmentation, suggesting that these clefts are clinically significant. Therefore, most Pediatric Otolaryngologists treat these entities similarly in symptomatic patients. One recent study looked at injection augmentation for all pediatric patients with chronic aspiration, regardless of the presence of a type 1 cleft, and found benefit in patients with normal anatomy as well as in those with a type 1 laryngeal cleft. This suggests that there may be even more subtle variants that we are not easily identifying or that these patients have a functional cleft rather than an anatomic cleft. Further

work is needed to define a superior limit for making the diagnosis of a deep interarytenoid notch and to further study functional versus anatomic clefts.

Editorial Comment

Dysphagia and aspiration are problems that are commonly encountered by the Pediatric Otolaryngologist. Although fairly uncommon, it is important to maintain a high index of suspicion for laryngeal cleft, because this condition can potentially be treated surgically. Laryngeal clefts can range from very subtle deep interarytenoid notches to type 4 clefts that extend a variable distance into the trachea. Over the past several years, the popularity of injection laryngoplasty has increased significantly, with tremendous benefit to many patients with dysphagia. In cases where the diagnosis is uncertain, injection can help to establish a diagnosis of type 1 laryngeal cleft. Additionally, even in patients with chronic aspiration and normal anatomic findings, injection has been shown to have significant benefit. This is an exciting area within Pediatric Otolaryngology and an area ripe for further study.

Review Questions

1. Which of the following correctly describes a type 2 laryngeal cleft?

   a. Cleft to the level of the false vocal cords

   b. Cleft that extends to the level of the true vocal cords

   c. **Cleft that extends into the cricoid cartilage**

   d. Cleft that extends through the cricoid cartilage and into the trachea

2. Which syndrome is associated with laryngeal cleft?

   a. Down syndrome

   b. **Pallister-Hall syndrome**

   c. Crouzon syndrome

d. Pfeiffer syndrome

3. Which option is a disadvantage of fiber **optic** examination of swallowing compared to a modified barium swallow study?

   a. Unable to directly visualize anatomy

   b. Unable to assess for silent aspiration

   c. Requires radiation

   d. **Unable to assess pharyngeal phase of swallowing**

4. When performing an endoscopic or open repair of a laryngeal cleft, which of the following is true regarding the suture repair?

   a. Tie sutures with tails on the laryngeal side of the repair.

   b. **Tie sutures with tails on the esophageal side of the repair.**

   c. It is best to use all vertical mattress sutures.

   d. It is best to use all horizontal mattress sutures.

Recurrent Respiratory Papillomatosis

Craig Derkay, and Travis Reeves

Introduction

Recurrent respiratory papillomatosis (RRP) is a disease of viral etiology, caused by human papillomavirus (HPV) types 6 and 11, associated with exophytic lesions of the airway. Although it is a benign disease, RRP has potentially morbid consequences due to its involvement of the airway, its propensity to recur, and its risk of malignant conversion. Surgical therapy for RRP requires a skilled team consisting of otolaryngologists, anesthesiologists, and operating room personnel working together in a facility properly equipped to manage the difficult pediatric airway.

Key Operative Learning Points

1. The goal of surgical therapy is to maintain a patent airway, improve the quality of the voice, and avoid harm.

2. Close coordination with a pediatric anesthesiologist is critical for successful surgical management of patients with RRP.

3. Many adjuvant therapies, such as Avastin and cidofovir, are available for severe cases of RRP.

Preoperative Period

History

1. History of present illness

   a. The quality of the patient's voice should be assessed. If hoarseness is

present, then the onset and timing of the voice changes should be documented.

b. Respiratory distress, shortness of breath, and exercise intolerance are common presenting symptoms. The timing, quality, and severity of these symptoms should be investigated carefully. Rapid onset with severe symptoms warrants urgent intervention.

c. The patient should be assessed for other possible lesions of the upper aerodigestive tract. An exhaustive history should be taken that would include other symptoms such as dysphagia, weight loss/failure to thrive, diet, and risk factors such as smoking and alcohol use (in the adult population).

2. Past medical history

a. Maternal history of human papilloma virus (HPV) infection and any history of HPV vaccinations should be documented.

b. Prior treatment:

1) Previous RRP surgical procedures (obtain operative notes, pathology reports and/or photos if possible)

2) Adjunct medical therapies

c. Other medical illnesses

d. Other surgical procedures

e. Family history:

1) Anesthetic complications

2) Bleeding disorders

f. Medications (prescription and over-the-counter [OTC] drugs)

Physical Examination

Fiberoptic laryngoscopy: Careful, sequential inspection of the nose, nasopharynx, pharynx, hypopharynx, larynx, and subglottis provides the critical information necessary to make the diagnosis of RRP and allows estimation of lumen size, vocal cord mobility, and the urgency of operative intervention. Further, this examination allows the surgeon to comprehensively examine the larynx to rule out other etiologies for the

patient's presenting symptoms such as vocal cord paresis, functional voice disorder, and other benign vocal cord processes (i.e., nodules, polyps). Papillomas have a distinctive appearance on laryngoscopy, but definitive diagnosis requires biopsy and pathologic examination (Fig. 196.1).

Imaging

Rarely, recurrent respiratory papillomatosis can spread to the lower airway.

A chest radiograph or chest computed tomography (CT) could be considered if there is concern for lower airway obstruction such as a history of recurrent pneumonia or hemoptysis. A CT of the neck would only be performed if there was a concern for upper airway malignancy, which is rare in children.

Indications

- Biopsy needed to confirm diagnosis at initial presentation
- Symptoms of airway obstruction
- Hoarseness and voice disturbance

Contraindications

1. Medical comorbidities with increased risk for general anesthesia in elective cases

Preoperative Preparation

1. Control other medical comorbidities.

2. Discontinue antiplatelet drugs if possible.

Operative Period

Anesthesia

General anesthesia is preferred for extensive disease, acute airway obstruction, and the pediatric population. Utilization of an anesthesiologist with pediatric expertise and familiarity with this entity is crucial to ensure safety in juvenile-onset recurrent respiratory papillomatosis (JORRP).

- Induction
  - Induction typically proceeds with mask induction through the use of sevoflurane with or without nitrous oxide (NO). NO increases the speed of induction and reduces the time spent in stage II, where laryngospasm is most prevalent. Conversely, its use reduces the fraction of inspired oxygen (FiO_2) giving the anesthesiologist less time before a desaturation event if an airway emergency were to occur.
- Airway management
  - Intubation:
    - Continuous: The endotracheal tube (ETT) is placed after induction and remains throughout the surgical procedure. This provides a definitive airway for the anesthesiologist regardless of paralyzation status. It also allows for the use of volatile anesthetics. However, it can distort laryngeal anatomy, obscure the operative sight for the otolaryngologist, and provide fuel for an airway fire if a laser is being used.

FIG. 196.1 Characteristic appearance of RRP on fiberoptic laryngoscopy.

- Intermittent: The ETT is removed intermittently and replaced when oxygenation and ventilation are required. This provides the otolaryngologist with an unobstructed, nonmobile view but can lead to hypercapnia, hypoxia, and subglottic, laryngeal, or tracheal swelling due to multiple intubations. Ideally, ventilation with the ETT in place should last as long as needed to return the peripheral capillary oxygen saturation (SpO_2) and partial pressure or maximal concentration of carbon dioxide ($EtCO_2$) to baseline prior to the next extubation.

- Nonintubation:
  - Total intravenous anesthesia (TIVA) is preferred for this method.
  - Spontaneous ventilation: Oxygen can be administered through the laryngoscope using the insufflation port by connecting it to the anesthesia circuit via an ETT adaptor.
  - Jet ventilation: A small catheter is positioned distally to allow high-flow oxygen to inflate the lungs and allow for small-volume ventilation. Unfortunately, jet ventilation has a higher risk of pneumothorax and may be ineffective in obese patients or those with extensive, small airway disease.

Local: Topical anesthesia can be used with fiberoptic laryngoscopes for biopsy and administration of laser therapy. This technique is appropriate for limited disease in the adult population.

Positioning

Supine: The patient is positioned in a standard fashion for direct laryngoscopy. Many surgeons prefer a "sniffing" position or shoulder roll for optimal alignment with the larynx.

Perioperative Antibiotic Prophylaxis: Antibiotic prophylaxis is not typically used.

Perioperative Steroids: These are administered to reduce the risk of postoperative nausea/vomiting and airway edema.

Monitoring

Routine anesthesia monitoring to include pulse oximetry, electrocardiogram (ECG), and temperature

Instruments and Equipment to Have Available

1. Basic direct laryngoscopy set
   a. Laryngoscope (Parson, Lindholm, Dedo)
   b. Suspension device
   c. Light sources
   d. Microscope or magnified telescope
   e. Video tower
   f. Suction
2. Age-appropriate rigid ventilating bronchoscope available as needed for acute airway obstruction
3. Laser safety equipment as indicated
4. Microdébrider
5. Filtered suction
6. Smoke evacuator unit
7. Assortment of laryngeal biopsy forceps, alligators, suctions
8. Laryngeal (vocal cord) spreader (optional)

Key Anatomic Landmarks

1. A thorough understanding of the laryngeal anatomy is critical to performing surgery for RRP. Structure and function of the larynx should be maintained to preserve the patient's voice and to prevent abnormal scarring.
   a. Vocal cords: The vibratory surface of the cords should be protected

as much as possible. Removal of the deep musculature of the vocal cords is unnecessary for this epithelial disease and is avoided to preserve function.

b. Anterior commissure: This area is critical to laryngeal function and voice preservation. Care should be taken NOT to address the anterior aspect of both vocal cords during a single operation as abnormal scarring can result in an acquired laryngeal web.

c. Supraglottic structures: The epiglottis, false vocal cords, and arytenoids comprise the supraglottis and are often involved in RRP.

2. The subglottis and lower airway are more rarely involved in RRP; however, if disease has spread to these areas, then it is important to avoid circumferentially disrupting the mucosa to prevent cicatricial scar formation.

Prerequisite Skills

1. Suspension laryngoscopy

2. Rigid bronchoscopy

Operative Risks

1. Acute airway obstruction during induction secondary to papilloma. Spontaneous ventilation should always be used to reduce this risk. Communication and collaboration with anesthesiologists are crucial.

2. Laryngeal scarring and web formation

3. Permanent voice changes

Surgical Technique

- Induce the patient into general anesthesia with spontaneous ventilation (usually with sevoflurane), then establish IV access. Paralysis should be avoided until the airway is secure. If paralysis is used, then an apneic or jet technique is required for ventilation.
- If prior (office) flexible fiberoptic nasopharyngoscopy/laryngoscopy

have not been performed, then this can be done in the operating room (OR) to document vocal cord dynamics and assess for papillomas (or other pathologies) above the larynx.

- Direct laryngoscopy is then performed with a magnified telescope to map the affected areas. The larynx is sprayed with topical lidocaine to reduce reactivity to instrumentation. Photos are taken for documentation and to follow the effectiveness of therapy over time. Scoring of the extent of disease is useful at this point for documentation, assessment of response to therapy, communication with colleagues, and determining the next surgical interval (Fig. 196.2).[1]
- After laryngoscopy, the telescope should be advanced into the tracheobronchial tree for visualization of the subglottis, trachea, and main stem bronchi. If the airway is not secure due to bulky disease, then a rigid ventilating bronchoscope should be used.
- Suspension laryngoscopy is then performed according to the surgeon's preference. Dedo, Parson, Benjamin, and Lindholm laryngoscopes are all commonly used. We prefer a slight reverse Trendelenburg position to aid in visualization and surgeon comfort (particularly if the microscope is needed). After adjusting for excellent visualization, the microscope or magnified telescope can be used to perform the operation. Various techniques are commonly employed, but the goals of therapy are the same.
- Biopsy of the papillomatous lesion is performed. This should be repeated at subsequent RRP operations yearly (sooner if there is a change in the frequency of surgery, distal spread of papillomas, or institution of potentially carcinogenic adjuvant therapies).[2] Subtyping of the papilloma is desirable (if facilities are available) to help determine prognosis (HPV 11 tends to act more aggressively than HPV 6).[3]
- Goals of any therapeutic RRP regimen include eradication of disease from the airway, improvement in voice quality, control of disease spread, and decrease in the number of trips to the operating room for surgical débridement.
- A number of different techniques can be employed to obtain these

treatment goals, and the preferred modality depends on the surgeon's comfort and training.

- Laser treatment for RRP has been used for more than 30 years and is a popular treatment modality.[4]
  - CO_2 laser:
    - The CO_2 laser has an emission wavelength of 10,600 nm and converts light to thermal energy. It provides a controlled destruction of tissues with vaporization of water and also cauterizes tissue surfaces.
  - Pulse dye laser (PDL):
    - The PDL is a nonablative laser that selectively targets the microvasculature of the lesion, thus sparing the epithelium through a photoangiolytic effect. The wavelength of the PDL is 585 nm. The PDL takes advantage of the chromophore in oxyhemoglobin, which has peaks at both 540 nm and 585 nm. The PDL can be employed in the operating room or in an office-based setting.
  - Potassium titanyl phosphate (KTP) laser:
    - The KTP laser has a wavelength of 532 nm, which is similar to one of the peak absorption wavelengths of hemoglobin. The KTP laser can be used in the office or operating room setting to treat papillomatous lesions in a fashion similar to the PDL.
    - No study yet has determined the optimum energy delivery necessary to affect tissue coagulation and/or effectively cause photoangiolysis.
- General technique for laser surgery of the larynx
  - The laser is not used until the oxygen in the anesthesia mixture is lower than 40% and ideally between 26% and 30%.
  - Moistened neuro patties may be placed at the laryngeal inlet to decrease the air leak and to provide a backstop for errant laser shots. (These must be kept moist because they too can act as a source of combustion.)
  - A small-caliber suction device is kept close to the laser impact site to

remove the hot steam of vaporization. The suction can also be used to remove eschar and as a retractor of the vocal folds to allow for exposure of the subglottic region.

- Neuro patties soaked in oxymetazoline are used for removal of eschar and for hemostasis.
- Care is taken to avoid injuring the anterior commissure, and at least 1 mm of untreated mucosa should be left in this region so that a web does not develop during the healing period. Similar precautions are taken when addressing the posterior commissure.

- Microdébrider
  - In a survey of pediatric otolaryngologists conducted in 2004, the majority of respondents (52%) identified the microdébrider as the preferred technique for removal of papilloma.[5]
  - Advantages of this technique include: improved voice outcomes, minimal collateral laryngeal mucosal thermal trauma, less procedure time, fewer personnel required in the operating room, reduced cost when compared to the laser, and no increase in pain scores. Safety advantages include no risk of laser fire or burns and reduced risk of exposure of operating room personnel to aerosolized viral particles.[6]
  - Surgical technique
    - A proper length Xomed (Medtronics, Minneapolis, Minnesota) laryngeal Skimmer blade is chosen (18 cm vs. 22 cm depending on the relative size of the child). A 250-cc bag of sterile saline or water is used for irrigation, and the microdébrider unit is typically set between 600 and 1000 rpm in oscillation mode.
  - The surgeon must be comfortable working with the microdébrider in either hand; the removal of a papilloma from the left side of the larynx is best accomplished when the device is used in the right hand, while disease from the right side should be removed with the microdébrider in the surgeon's left hand. The hand opposite the device holds a microsuction, which is used to help retract tissue and evacuate blood.
  - To minimize the risk of web formation, it is essential to avoid creating opposing raw surfaces at both the anterior and posterior commissure with the microdébrider. Care should also be taken when

removing sessile papillomas from the true vocal cord surface, erring on the side of leaving disease as opposed to sacrificing a portion of the vocal fold.

- The microdébrider does allow for removal of papillomas in the subglottis and proximal one-third of the trachea by placing a 7200-A telescope in one hand and the microdébrider in the other.

- Adjunctive therapy
  - Medications can be administered via submucosal injection during RRP surgery. These adjunctive therapies have been shown to improve long-term outcomes.[7]
  - Technique: A spinal needle, laryngeal cord injector, or butterfly needle on an alligator forceps can be used for submucosal injections and is administered under telescopic or microscopic guidance.
  - Medications
    - Bevacizumab (Avastin): This antiangiogenic agent has been shown in small studies to work synergistically with the photoangiolytic KTP laser.[8]
      - Dose: Typically patients will receive 5 to 10 mg per treatment encounter.
    - Cidofovir[2]
      - Dose: 3 mg/kg given at a concentration of 2.5 to 10 mg/mL. Usually less than 2 mL is given per treatment encounter. This medication should be administered once per month for 4 to 6 months to see optimal treatment effect.

A. Clinical Score

DATE OF SURGERY _____ SURGEON _____

INSTITUTION _____

1. Describe the patient's voice today:
   normal ___ (0), abnormal ___ (1), aphonic ___ (2)
2. Describe the patient's stridor today:
   absent ___ (0), present with activity ___ (1), present at rest ___ (2)
3. Describe the urgency of today's intervention:
   scheduled ___ (0), elective ___ (1), urgent ___ (2), emergent ___ (3)
4. Describe today's level of respiratory distress:
   none ___ (0), mild ___ (1), moderate ___ (2), severe ___ (3), extreme ___ (4)

Total score for questions 1 through 4 = _____

Total Anatomic Score plus Total Clinical Score _____

FIG. 196.2 Laryngoscopic and clinical assessment scale for recurrent respiratory papillomatosis.

- Risks: There are concerns about an increase in the risk of malignancy with cidofovir, but it is unclear whether the risk exceeds that of the disease process itself.
  - Indications
  - More than six surgeries per year
  - Increasing frequency of surgery
  - Extralaryngeal or bulky disease

Common Errors in Technique

1. Inadequate exposure with poor visualization of the laryngeal

structures

2. Bilateral mucosal injury at the anterior commissure resulting in laryngeal web formation and voice disruption

Postoperative Period

Postoperative Management

1. Continuous pulse oximetry in the postanesthesia care unit (PACU)

2. Albuterol and racemic epinephrine nebulizers are ordered for patients in the PACU on an as-needed basis.

3. Pain medication: Patients would not be expected to have much pain following this operation. Nonsteroidal anti-inflammatory drugs such as ibuprofen may be administered. Occasionally a dose of steroids is administered postoperatively if the patient has symptomatic obstruction secondary to mucosal edema.

4. Humidified air and supplemental oxygen are given as needed.

Complications

1. Vocal cord scarring

2. Laryngeal web formation

3. Cicatrix formation in the lower airway

4. Voice changes

5. Perioperative airway obstruction

6. Recurrence of papillomas and/or distal spread

7. Iatrogenic exposure of HPV to OR personnel and subsequent patients (this is minimized by the use of a laser-safe mask and changing of anesthesia tubing between cases).

8. Potential complications of laser surgery include the development of anterior commissure webs, laryngeal and subglottic stenosis, burns to the patient or operating room personnel, and laser-induced endotracheal

tube fire.

9. Laser fire

This event is more likely to occur when there are high oxygen concentrations and in the presence of a polyvinyl chloride endotracheal tube. Direct thermal injury to local tissues or a chemical burn may result from such a mishap. To prevent a laser fire, the oxygen concentration should be limited to less than 40%, or alternately the patient can be ventilated with room air. Avoidance of any flammable object (i.e., an endotracheal tube) in the operating field can eliminate this risk. In the event of a laser fire, emergency care consists of immediate extubation of the patient and disconnection of the tube from its oxygen source. The child is then reintubated and examined through a ventilating bronchoscope. Antibiotics are given and a tracheotomy may be necessary based on the degree of damage. Tertiary care consists of positive end-expiratory pressure (PEEP) and reverse isolation.

Alternative/Additional Management Plan

1. Systemic chemotherapeutic medications[7]

2. Zeitels has advocated local injection of Avastin and KTP laser treatment for recurrent RRP.[8]

3. Tracheostomy.[9] Use of tracheostomy for management of RRP is controversial. In a limited-resource setting, this may be the safest means of managing the disease. With access to tertiary care pediatric facilities and providers, tracheostomy may lead to spread of the disease outside of the larynx and complicate future management.

4. Prevention though HPV vaccination.[10] This is the most promising development in RRP in the past decade. The introduction of the quadrivalent HPV vaccine (and recent approval of the 9-valent vaccine) for use in boys and girls before they become sexually active (i.e., before they are exposed to HPV) may significantly reduce the future incidence of RRP (and some forms of head and neck cancer) in the population via herd immunity. Otolaryngologists should work with their colleagues in pediatrics, family medicine, and gynecology to advocate for HPV vaccination of teenagers.

5. Collaboration of research with the RRP Task Force. With orphan disease such as RRP, it is difficult for a single center to have enough patients to test out innovative treatments. Consequently, it is desirable to coordinate research endeavors and evaluate research ideas with colleagues at other institutions. This has been facilitated through the creation of the RRP Task Force. See additional readings later in this chapter for further information.

Evidence-Based Medicine Question

Is Subepithelial Injection Performed at the Same Time as Routine RRP Surgery as Effective as Laser/Microdebrider Alone?

Consensus of the cidofovir working group and the RRP Task Force is that use of adjuvant subepithelial injections are more effective when combined with the surgical ablation of papillomas (Volsky reference/Derkay-Wiatrak review article).

Editorial Comment

Recurrent respiratory papillomatosis is a frustrating, capricious disease with the potential for morbid consequences due to its involvement of the airway and the risk of malignant degeneration. The goals of surgical therapy are to maintain a safe airway with a serviceable voice while avoiding excessive scarring. Surgical therapy for RRP requires a skilled team consisting of otolaryngologists, anesthesiologists, and OR personnel working together in a facility properly equipped to manage difficult pediatric airways. Although adjuvant therapies such as Avastin and cidofovir can improve on surgical outcomes, the only truly effective treatment for RRP is prevention through HPV vaccination. As vaccination rates rise, we hope to see a dramatic decrease in the incidence of papillomatosis. Numerous questions remain related to HPV vaccination. Ongoing studies are seeking to understand these issues, which include the relationship between vaccination and rates of laryngeal HPV infection, the protective effect of antibodies transferred to infants born to vaccinated mothers, and the potential for preventing squamous cell carcinoma in the adult population. Standards of care for vaccination are changing, and the HPV vaccine is now in mainstream

use; however, societal acceptance of a vaccine for a sexually transmitted disease is still lacking. Otolaryngologists should advocate for administration in their communities and in coordination with local pediatricians.

Review Questions

1. Which of the following HPV subtypes is most commonly associated with RRP?

   a. Types 1 and 2

   b. **Types 6 and 11**

   c. Types 16 and 18

   d. Types 53 and 57

   e. Types 62 and 69

2. Which of the following factors predisposes to a more severe clinical course in children with JORRP?

   a. **Diagnosis of RRP at less than 3 years of age**

   b. HPV subtype 6

   c. Maternal history of condylomata

   d. Family history of RRP

3. Which of the following is the most commonly used adjuvant for RRP among members of the American Society of Pediatric Otolaryngology (ASPO)?

   a. Bevacizumab (Avastin)

   b. **Intralesional cidofovir**

   c. Celecoxib (Celebrex)

   d. Interferon

4. RRP demonstrates a predilection for which of the following sites?

a. Junction of ciliated and squamous epithelium

b. The undersurface of the vocal folds

c. The laryngeal ventricle

d. **All of the above**

5. Which option includes the most common presenting symptoms in children with RRP?

a. Dysphagia and poor weight gain

b. Dyspnea with exertion

c. **Progressive hoarseness and stridor**

d. Odynophagia

6. Which of the following statements best describes the management of RRP?

a. Complete eradication of disease is essential.

b. **The goal of surgical therapy is to maintain a patent airway, improve voice quality, and do no harm.**

c. Adjuvant therapies such as cidofovir should be used in children with mild RRP who require surgical intervention two or fewer times per year.

d. Tracheostomy is a mainstay of treatment and should be considered in all infants diagnosed with RRP.

Exit Procedure

David Mandell, and Jeffrey P. Simons

Introduction

The ex utero intrapartum treatment (EXIT) procedure is a technique for managing fetal airway obstruction at the time of delivery. The key component of the procedure is that a fetal airway is established while maintaining fetal oxygenation with the uteroplacental circulation.[1]

Fetal airway obstruction is typically first identified via an incidental finding on routine prenatal ultrasonography, which then leads to more detailed imaging with fetal magnetic resonance imaging (MRI).[2] Having identified fetal upper airway obstruction in advance, clinicians can plan an EXIT procedure in an attempt to improve fetal outcome. At the time of delivery, maternal-fetal circulation (uteroplacental gas exchange) is maintained while the fetus is partially delivered, allowing time to establish the fetal airway (via orotracheal intubation or tracheostomy), after which the umbilical cord can be clamped.[1] Optimal maintenance of uteroplacental support during delivery requires cesarean section with inhibition of uterine contractility.[3] With traditional cesarean section, removal of the fetus from the uterine cavity leads to uterine contraction followed by placental separation typically within 5 minutes, by which time fetal anoxic brain injury would be expected to occur if the fetal airway had not yet been established. With the EXIT procedure, the uteroplacental circulation can be maintained for approximately 60 minutes after the fetus has been removed from the uterine cavity, allowing more time to establish a fetal airway.[4] A longer duration of uteroplacental support after hysterotomy is achieved via deep maternal general anesthesia, which suppresses uterine contractility.[3] However, suppression of uterine contractility during the EXIT procedure makes maternal blood loss from the hysterotomy a significant concern.[4]

Key Operative Learning Points

- Fetal upper airway obstruction (intrinsic structural obstruction or extrinsic compression from a neck mass) can lead to catastrophic birth.
- Fetal upper airway obstruction is typically first identified via an incidental finding on routine prenatal ultrasonography, which then leads to more detailed imaging with fetal MRI.
- If fetal upper airway obstruction is identified in advance, an EXIT procedure can be planned to improve fetal outcome.
- The key feature of the EXIT procedure is that, at the time of delivery, maternal-fetal circulation (uteroplacental gas exchange) is maintained while the fetus is partially delivered, allowing time to establish the fetal airway (orotracheal intubation or tracheostomy), after which the umbilical cord can be clamped.
- Optimal maintenance of uteroplacental support during delivery requires cesarean section with inhibition of uterine contractility.
- With traditional cesarean section, removal of the fetus from the uterine cavity leads to uterine contraction, followed by placental separation typically within 5 minutes, by which time fetal anoxic brain injury would be expected to occur if the fetal airway had not yet been established.
- With the EXIT procedure, the uteroplacental circulation can be maintained for approximately 60 minutes after the fetus has been removed from the uterine cavity, allowing more time to establish a fetal airway.
- A longer duration of uteroplacental support after hysterotomy is achieved via deep maternal general anesthesia, which suppresses uterine contractility.
- Suppression of uterine contractility during the EXIT procedure makes maternal blood loss from the hysterotomy a significant concern.

Preoperative Period

History

- Maternal: Standard anesthetic history
- Ask about maternal shortness of breath or light-headedness (could suggest circulatory compromise by the gravid uterus).
- Ask about maternal severity of gastroesophageal reflux disease (GERD).
- Pregnancy history (gravida and para status, any past or current pregnancy complications)
- Fetal: Findings on prenatal imaging

Physical Examination

- Standard maternal anesthetic physical examination
- Estimated fetal weight (based on examination and ultrasound; determines dosage of fetal drugs given during the procedure)

Imaging

- Routine prenatal ultrasound provides first view of fetal neck mass.
- Giant neck mass can cause distortion and compression of the larynx and/or trachea.
- Fetal lungs produce amniotic fluid; upper airway obstruction preventing egress of this fluid results in pulmonary expansion.
- Sonographic findings suggestive of tracheal obstruction/increased intratracheal pressure include bilateral expanded lungs, flattened or everted diaphragm, and dilated airway distal to obstruction.
- Subsequent fetal MRI obtained after fetal ultrasound (determines extent of the obstructing mass, airway patency, degree of obstruction, anatomy for determining feasibility of tracheostomy)
- Serial MRI to track changes
- Assess for hydrops fetalis: Distended respiratory tree directly

compresses vena cava leading to ascites, hydrops

- Assess for polyhydramnios (results from large neck mass obstructing fetal swallowing, suggests that there is probably tracheal obstruction)
- Fetal echocardiography (increased intracardiac pressure from compression from distended respiratory tree)
- Estimated fetal weight (based on examination and ultrasound; determines dosage of fetal drugs given during the procedure)
- Assess location of placenta (affects patient positioning and cesarean-section incision site).

Indications

- The need for an EXIT procedure most commonly arises when prenatal imaging demonstrates fetal airway obstruction that would not be compatible with the life of the infant after delivery.
- Congenital high airway obstruction syndrome (CHAOS) is an adverse physiologic cascade of events precipitated by complete internal obstruction of the fetal airway (common etiologies include laryngeal web, congenital subglottic stenosis, and laryngeal atresia).
- Large congenital neck mass (most common: teratoma and lymphatic malformation; others include neuroblastoma, goiter, and branchial cleft cyst) (Figs. 197.1 and 197.2)
- Congenital fetal oropharyngeal tumors (such as epignathus) or oromaxillofacial tumors (such as epulis)

FIG. 197.1 Patient with a large cervical teratoma with tracheostomy immediately after EXIT procedure. Reproduced with permission from Otteson TD, Hackam DJ, Mandell DL: The ex utero intraoartum treatment (EXIT) procedure. *Arch Otolaryngol Head Neck Surg* 2006;132:686-689.

FIG. 197.2 Patient with large right cervicofacial lymphatic malformation successfully intubated transorally during EXIT procedure. Reproduced with permission from Otteson TD, Hackam DJ, Mandell DL: The ex utero intraoartum treatment (EXIT) procedure. *Arch Otolaryngol Head Neck Surg* 2006;132:686-689.

- Severe fetal micrognathia (such as in Pierre Robin sequence, which can

include micrognathia, glossoptosis, airway obstruction, and cleft palate)

- Unilateral pulmonary agenesis, severe bilateral pleural effusion
- In order to secure the airway and place vascular access in preparation for extracorporeal membrane oxygenation (ECMO) if fetus has severe congenital diaphgragmatic hernia or severe aortic stenosis/hypoplastic left heart syndrome (e.g., EXIT to ECMO)
- As a strategy for the resection of a large chest mass compressing the thoracic trachea while the fetus is on placental support
- Conjoined twins

Contraindications

- Preterm gestational age (this is a relative contraindication; if there is premature rupture of membranes/premature labor, EXIT can be performed, but the ideal time is at term)
- Maternal medical comorbidities with increased risk of general anesthesia

Preoperative Preparation

- Teamwork: A multidisciplinary team is required, including a Pediatric Anesthesiologist, Obstetric Anesthesiologist, high-risk Obstetrician (maternal-fetal medicine specialist), Pediatric Otolaryngologist, Pediatric General Surgeon, Neonatologist, Radiologist, and dedicated operating room (OR) and nursing staff.
- Serial team meetings must be held to follow at-risk patients during pregnancy.
- It is ideal for the Pediatric Otolaryngologist who is going to be involved with the procedure to meet with the parents before the time of delivery to discuss the procedure, explain the role of the otolaryngologist, and talk about the risks, benefits, and alternatives.
- It is important to have a contingency plan for management of the neonatal airway in case the EXIT procedure must be aborted and there

is an emergent delivery.

- A neonatal resuscitation team is needed to receive the newborn if EXIT is successful.
- A second OR team is required if resection of a neck mass/further surgical airway access is anticipated.
- Cross-matched blood must be available for the mother and warm type O-negative blood for the fetus.

Operative Period (Fig. 197.3)

Anesthesia

- Maternal
  - Deep general anesthesia (complete uterine relaxation is needed to decrease likelihood of labor during fetal manipulation and also to maintain uteroplacental circulation, preserve uterine volume, and prevent placental abruption)
  - For reflux prophylaxis, a second large-bore intravenous (IV) line is required owing to the risk of bleeding; for thromboprophylaxis, be prepared to counteract maternal hypotension, using tocolytic agents as adjuncts to encourage myometrial relaxation.
  - Place high lumbar epidural for postoperative analgesia.
  - Turn off volatile inhaled anesthetic and give oxytocin IV to induce uterine contractions (and thus help control bleeding) as soon as the umbilical cord has been clamped and the fetus delivered.

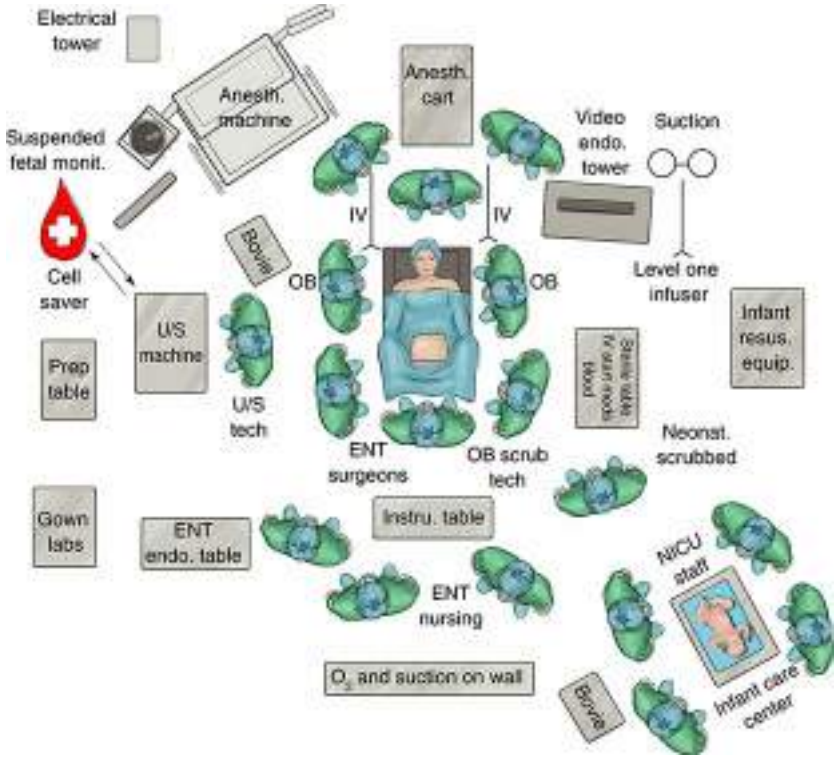

FIG. 197.3 The typical layout of a setup for an EXIT procedure.

- Fetal
  - Goal: To achieve a surgical level of fetal anesthesia without cardiac depression; maternal anesthetic agents do reach the fetus via the placenta
  - Fetal anesthesia can be supplemented by the surgical or neonatology team with a single intramuscular injection of an opioid (e.g., fentanyl) and atropine and a muscle relaxant (e.g., vecuronium).
  - Fetal IV access (24-gauge) can be obtained but should not interfere with the team establishing the airway while the fetus is on placental support.

Positioning

- Supine maternal position
- If needed, maternal positioning left side down can be considered to counteract aortocaval compression and hypotension.

Perioperative Antibiotic Prophylaxis

- First-generation cephalosporin given prior to the start of cesarean section

Monitoring

- Maternal
  - Standard monitoring (pulse oximeter, continuous electrocardiogram, core body temperature) for general anesthesia, with the addition of an arterial catheter (small changes in maternal blood pressure [BP] can have dramatic effects on fetal perfusion as well as heart rate and function) and bladder catheter
- Fetal
  - Pulse oximeter placed on upper extremity.
  - Sterile continuous intraoperative fetal echocardiography
  - If there is fetal bradycardia related to maternal or fetal bleeding/maternal hypotension, blood products should be readily available.
  - Umbilical blood gas measurement if needed

Instruments and Equipment to Have Available

- Complete set of equipment used for cesarean section (by the obstetrics team)
- Complete set of pediatric airway equipment on a sterile side table
  - Rigid neonatal laryngoscope with straight blades (i.e., Parsons laryngoscope)
  - Rigid ventilating bronchoscopes (sizes 2.5 and 3), with 0-degree neonatal telescope, sterile camera, and video tower
  - Uncuffed neonatal endotracheal tubes (sizes 2.0, 2.5, 3.0, 3.5)

- Complete set of instruments used for neonatal tracheostomy
- Sterile circuit with manometer on OR table to manually ventilate fetus after airway has been established

Key Anatomic Landmarks

- For cesarean section: Wide low transverse laparotomy, halfway between symphysis pubis and umbilicus
- Site for hysterotomy should be chosen 6 cm or more from marked placental edge
- For neonatal laryngoscopy: If the neck mass is unilateral, the laryngotracheal airway is often severely deviated to the contralateral side.
- For neonatal tracheostomy: Uneven retraction can easily pull the airway away from the midline, so frequent confirmation of the location of the trachea with palpation is required during the dissection.
- For neonatal tracheostomy: The cricoid cartilage and the first three tracheal rings are important landmarks.

Prerequisite Skills

- Pediatric direct laryngoscopy and rigid bronchoscopy
- Pediatric tracheostomy
- Communication skills are very important, as many people from many services will be working together to take care of both mother and fetus.

Operative Risks

- Fetal distress (from umbilical cord compression/kinking, placental separation, inadequate uterine relaxation, maternal hypotension, fetal hypothermia)
- Inability to secure a neonatal airway via endoscopic or open techniques
- Uterine atony/maternal hemorrhage (from suppression of uterine

contractility)

Surgical Technique

- Obstetrical team
  - Wide low transverse laparotomy, halfway between symphysis pubis and umbilicus
  - Intraoperative sterile ultrasound used to map position and the edge of the placenta in order to plan site of hysterotomy (must be at least 6 cm away from edge of placenta)
  - Hysterotomy made with uterine stapling device (to decrease bleeding)
  - Uterine cavity filled with continuous warm crystalloid solution to maintain amniotic volume and fetal temperature (amnioinfusion)
  - Fetus only partially delivered to expose only the necessary anatomy (uterine contraction and placental separation occurs too rapidly with complete delivery)
  - Pulse oximetry and 24-gauge IV catheter placed via upper extremities of fetus
  - Continuous sterile intraoperative fetal echocardiography performed
- Pediatric Otolaryngology/surgical team
  - Attempt direct laryngoscopy and transoral endotracheal intubation (Fig. 197.4).
  - If initial intubation is unsuccessful, perform rigid bronchoscopy to assess laryngotracheal anatomy and assist intubation.
  - Can use 0-degree telescope alone or with ventilating bronchoscope (no need to ventilate as long as there is ongoing placental support)
  - Often useful to place a size 3.0-endotracheal tube over a 2.7-mm (neonatal) Hopkins rod telescope and intubate under direct visualization with the Seldinger technique

FIG. 197.4 Patient undergoing direct laryngoscopy and transoral endotracheal intubation on uteroplacental support during an EXIT procedure.

- Armored endotracheal tube intubation can be attempted if endoscopy shows that intubation is possible.
  - If unable to intubate transorally, perform a tracheostomy (Fig. 197.5):
- Transverse incision 1 to 2 fingerbreadths above sternal notch
- Expose the first several proximal tracheal rings.
- Dissect superiorly to visualize cricoid and thyroid cartilage and confirm correct location.
- If there is time, place a vertically oriented 4.0 Neurolon suture several millimeters from each side of midline through the second and third tracheal rings (traction sutures).
- Make a vertical midline incision with #11 or #15 blade through second and third tracheal rings (once in the lumen, turn the sharp side of the blade outward, away from the lumen, to complete the incision (to avoid harming the posterior tracheal wall)).
- Insert neonatal tracheostomy tube, secure with shoelace cotton ties around the neck (and suture via the tracheostomy tube flanges if desired)
- Connect Mapleson circuit to tracheostomy tube and make sure that manual bag ventilation in the field is successful by observing chest

expansion and auscultated breath sounds, increases in fetal oxygen saturation, presence of end-tidal CO_2

- Confirm correct tracheostomy tube placement with pediatric flexible fiberoptic tracheoscopy via the indwelling tracheostomy tube.
- Surfactant is often given if the fetus has had less than 34 weeks' gestation.
- If the neck mass is compressing the trachea too much to allow for endotracheal intubation or is impeding access to the trachea for tracheostomy, partial resection of the mass on placental support is necessary, or the mass (if cystic) can be decompressed with needle aspiration.
- Umbilical cord is clamped and divided once the airway is secure
- Newborn taken to incubator in the room for further evaluation and resuscitation by the neonatology team, after which the newborn is taken to the neonatal intensive care unit.

FIG. 197.5 Patient with a large cervical teratoma undergoing a tracheostomy on uteroplacental support during an EXIT procedure. Reproduced with permission from Otteson TD, Hackam DJ, Mandell DL: The ex utero intraoartum treatment (EXIT) procedure. *Arch Otolaryngol Head Neck Surg* 2006;132:686–689.

Common Errors in Technique

- Failing to separate maternal fluids and drugs from fetal fluids and drugs, especially during tense moments of the procedure
- Performing the hysterotomy too close to the placenta, leading to bleeding and more rapid delivery or separation of the placenta
- Ventilation of fetal lungs performed before a secure airway has been confirmed and the umbilical cord is clamped (lung ventilation leads to transition to neonatal circulation, losing the benefits of operating on placental support)

Postoperative Period

Postoperative Management

- After the placenta has been delivered, the obstetric anesthesiology team rapidly reverses uterine relaxation (giving oxytocin and decreasing the concentration of inspired volatile anesthetic), after which the obstetrical team closes the uterus and maternal abdominal wall in a similar fashion to a typical cesarean section.
- Epidural catheter dosed for maternal postoperative analgesia
- Postoperative maternal tocolysis continues with magnesium infusion, transitioned to oral nifedipine.
- Once the neonatal airway has been established and the newborn is stable, further evaluation of the infant can occur.
- For a patient with a mass in the neck, often additional imaging is obtained (computed tomography [CT], MRI, or ultrasound) prior to planning for excision.
- For a patient with severe micrognathia, a facial CT is often obtained and further treatment options are discussed, such as mandibular distraction or tracheostomy (if the patient is intubated).
- For a patient with laryngeal atresia or significant upper airway stenosis, laryngotracheal reconstruction will eventually be performed.

Complications

- Umbilical cord compression or kinking or premature separation from uterus (abruption), either from loss of amniotic fluid or from surgical manipulation: rapid deterioration of the fetus, in which case the umbilical cord may have to be divided prematurely and an immediate attempt at establishing an airway (with intubation, rigid bronchoscopy, or tracheostomy) on a side table will be needed (with intubation, rigid bronchoscopy, or tracheostomy)
- Pneumothorax during tracheostomy due to high lung apices in the neonate
- Injury to larynx, trachea, or esophagus during intubation or endoscopy
- Inability to secure a neonatal airway via endoscopic or open techniques
- Uterine atony/maternal hemorrhage (from suppression of uterine contractility)

Alternative Management Plan

- It is an option in some cases to have a normal cesarean section delivery without an EXIT procedure, with the Otolaryngology service in the delivery room ready to assist in establishing a fetal airway on the back table without uteroplacental circulation. The risk to the mother is lower with this technique but the risk of fetal death from inability to establish an airway is higher.
- In some instances, depending on the severity of fetal abnormalities, the parents may elect to not attempt heroic resuscitation measures; this decision can raise many ethical issues.

Discussion

Evidence-Based Medicine Question

Research in the literature available to date suggests that indications for an EXIT procedure may include all of the following *except:*

A. Congenital fetal oropharyngeal tumors

B. CHAOS

C. **Thyroglossal duct cyst**

D. Unilateral pulmonary agenesis

E. Fetal micrognathia

F. Conjoined twins

Explanation: Answers A, B, D, E, and F are all possible indications for an EXIT procedure. A thyroglossal duct cyst (answer C) does not typically cause significant enough airway obstruction to require an EXIT procedure. In addition, thyroglossal duct cysts are frequently not even detected at the time of birth.

Reference: Moldenhauer JS: Ex utero intrapartum therapy. Semin Pediatr Surg 2013, 22:44-49.

Editorial Comment

The EXIT surgical procedure described in this chapter is as complex as it is uncommon, but it is an important technique to be aware of as it can save the lives of newborns that, due to upper airway obstruction, would otherwise not survive after delivery.[1,3] The complexity arises mainly from the logistical organization needed to carry out the procedure. Each component of the multistep operation is well known (e.g., cesarean section, direct laryngoscopy and bronchoscopy, tracheostomy). What makes the EXIT procedure complex, however, is the sequential placement of all of these components and the unique adaptation of each of these steps to the dangerous and high-risk nature of the patients and their disease processes.[5] Just as important as the surgical technique is the complex organizational approach to the EXIT procedure. The degree of multidisciplinary coordination and teamwork required for a successful EXIT procedure can be daunting and may be the most unique aspect of this challenging procedure. Although it may be difficult to orchestrate, the end result often leads to a remarkably euphoric sense of accomplishment for all parties involved and, most importantly, a life potentially saved.

David Mandell

Review Questions

1. From the maternal standpoint, the EXIT procedure requires all of the following key features *except:*

   a. Deep maternal general anesthesia

   b. **Maintenance of uterine tone to prevent maternal bleeding**

   c. Use of a stapler device for hysterotomy

   d. Placement of high lumbar epidural catheter

2. Prenatal imaging characteristics that indirectly suggest fetal upper airway obstruction include

   a. Fetal pulmonary hypoplasia

   b. Collapse of the distal airway lumen

   c. **Everted diaphragms**

   d. Decreased intracardiac pressure

3. During an EXIT procedure, it important to perform which of the following steps regarding the fetus after hysterotomy:

   a. **Fetal injection of IM opioid**

   b. Fetal electroencephalography

   c. Placement of a fetal arterial line

   d. Delivery of as much of the fetus and the umbilical cord will allow

4. While on uteroplacental support, all of the following fetal procedures can be performed *except:*

   a. Placement of a catheter for extracorporeal membrane oxygenation

   b. Excision of large neck or chest masses

   c. Fetal bronchoscopy

   d. **Congenital diaphragmatic hernia repair**

5. Common causes of CHAOS include

   a. **Laryngeal atresia**

b. Cervical teratoma

c. Cervical lymphatic malformation

d. Severe micrognathia

199. Management of Tracheal Stenosis

198

Tracheoscopy, Bronchoscopy, and Airway Foreign Bodies

Jeffrey P. Simons, and Sukgi Choi

Introduction

Rigid tracheoscopy and bronchoscopy are important methods for evaluating the airway in infants and children. During this procedure, a rigid telescope with or without a rigid ventilating bronchoscope is inserted transorally to evaluate the larynx, trachea, and bronchi. Rigid tracheoscopy and bronchoscopy can be both diagnostic and therapeutic, because a variety of airway abnormalities can be discovered and treated.[1] Instruments such as optical forceps, nonoptical instruments, lasers, and balloons can be passed through the bronchoscope to treat a variety of different airway conditions. It is important for all Otolaryngologists to be familiar with the instruments and techniques required for rigid tracheoscopy and bronchoscopy.

Flexible fiberoptic bronchoscopy is another technique used to evaluate the airway in infants and children; this procedure is more commonly performed by Pulmonologists. Rigid airway endoscopy and flexible bronchoscopy can be complementary methods to evaluate the airway in children. Each technique has its own indications, but they are sometimes performed together.

Foreign bodies of the airway can lead to significant morbidity and mortality in children. They are the fourth most common cause of accidental death in toddlers, accounting for about 3000 deaths per year in the United States.[2-4] Aspiration of foreign bodies occurs most commonly in children younger than 5 years of age.[2-4] Foreign bodies of the airway must be in the differential diagnosis in this age group for all nonspecific pulmonary symptoms, such as coughing and wheezing. Approximately half of the patients with foreign bodies of the airway do not have a

history of a witnessed foreign body aspiration event.[5] Therefore, clinical history, physical examination, and radiologic studies are important tools to help determine which patients should undergo bronchoscopy.[5] Prompt diagnosis of aspiration of a foreign body and its removal using rigid bronchoscopy are critical in preventing morbidity and mortality.

Key Learning Points

- Rigid tracheoscopy and bronchoscopy are important methods for evaluating the airway in infants and children; it is important for all Otolaryngologists to be familiar with these techniques.
- Rigid tracheoscopy and bronchoscopy can be performed with a Hopkins rod telescope alone or with a rigid ventilating bronchoscope (which can also have a Hopkins rod telescope to improve visualization).
- Tracheoscopy and bronchoscopy can be used to diagnose and treat a variety of abnormalities involving the larynx, trachea, and bronchi.
- Flexible bronchoscopy can be a useful technique in evaluating certain airway abnormalities in children, particularly abnormalities involving the more distal airway.
- For rigid airway endoscopy, the Hopkins rod telescope or bronchoscope is typically introduced through direct laryngoscopy.
- Rigid bronchoscopy is an important technique for the diagnosis and treatment of foreign bodies of the airway in children.
- Foreign bodies of the airway can lead to significant morbidity and mortality in children, and delay in diagnosis can increase the risk of complications.
- Aspiration of the foreign body occurs most commonly in children younger than 5 years of age.
- The most common foreign bodies of the airway are food products (nuts and seeds), followed by pieces of plastic toys, and then metal objects.
- The most common site for foreign bodies of the airway is the right main stem bronchus.

Preoperative Period

History

- History of previous surgeries, including previous direct laryngoscopy and rigid bronchoscopy procedures, previous airway surgery, or history of tracheotomy
- History of endotracheal intubation or a stay in the intensive care unit
- Ask about personal or family history of problems with anesthesia.
- History of abnormalities of the spine, spine surgery, or abnormalities of the brain
- History of stridor or stertor: inspiratory, expiratory, or biphasic; duration; severity; exacerbating or mitigating factors
- History of witnessed aspiration of a foreign body
- History of coughing, choking, gagging, dyspnea, respiratory distress, wheezing, hoarseness, or dysphagia
- Only about 50% of patients with aspiration of a foreign body have a witnessed aspiration event.[5]

Physical Examination

- Standard anesthesia physical examination
- Ability of the patient to extend the neck
- Ability of the patient to open the mouth and expose oropharynx to enable direct laryngoscopy, which is important for the introduction of a rigid telescope or a rigid ventilating bronchoscope
- Mallampati classification can be used to predict ease of direct laryngoscopy.
- Patients with a foreign body of the larynx can have hoarseness, aphonia, respiratory distress, or significant stridor.
- Patients with a foreign body of the trachea may present with the classic

physical examination triad of an audible slap (impact of mobile foreign body against the wall of the trachea), palpable thud over the trachea, or asthmatoid wheeze over the trachea.[2]

- Patients with a foreign body of the bronchi may have wheezing and decreased air entry with decreased breath sounds on the obstructed side.[2]
- 5% to 40% of patients who have a foreign body have no obvious findings on physical examination.[2,3,5]

Imaging

- Radiographs of the cervical spine in flexion and extension should be obtained in children with Down syndrome or other disorders with concern for instability of the cervical spine, although the diagnostic accuracy of this technique has been debated.[6,7]
- Patients with significant respiratory distress should not be taken to radiology for imaging prior to undergoing airway endoscopy in the operating room.
- Most foreign bodies of the airway are radiolucent (about 80%).
- Posteroanterior (PA) and lateral chest radiographs in the inspiratory and expiratory phase can be obtained in the assessment of patients with possible foreign body aspiration. Air trapping on the side of a foreign body is the most common abnormal radiographic finding in patients with a foreign body of the airway; this finding can be accentuated in the expiratory phase.[5]
- In patients who are unable to cooperate with inspiratory and expiratory phase radiographs, lateral decubitus radiographs can be obtained. In lateral decubitus films, air trapping can be seen when the foreign body side is dependent ("down").
- PA and lateral neck radiographs can sometimes reveal evidence of a foreign body of the larynx or subglottis.
- The most common radiographic abnormalities in patients with aspiration of a foreign body include air trapping or hyperinflation and atelectasis (Fig. 198.1).

- About 40% of patients with a foreign body of the airway have a completely normal chest radiographs.[3,5]

Indications

- Rigid tracheoscopy and bronchoscopy are used to evaluate the airway in infants and children with a variety of conditions; these techniques can be both diagnostic and therapeutic.
- Almost all children with biphasic or expiratory stridor require evaluation via rigid airway endoscopy in the operating room.
- Children with isolated inspiratory stridor can often be evaluated first in the office via flexible fiberoptic nasolaryngoscopy; however, if laryngomalacia or another etiology for the inspiratory stridor is not seen on flexible laryngoscopy, these patients also should undergo rigid airway endoscopy in the operating room to evaluate the entire airway.
- The rigid ventilating bronchoscope can be used as a tool to secure the airway in patients with significant airway obstruction who cannot be intubated with an orotracheal tube by traditional techniques.
- Patients with suspected aspiration of a foreign body should undergo rigid tracheoscopy and bronchoscopy for diagnosis and, if present, treatment of the foreign body.
- Patients with subglottic or tracheobronchial pathology such as a stricture, web, or granulation tissue can undergo rigid tracheoscopy and bronchoscopy and subsequent endoscopic treatment of the abnormalities with lasers, balloon dilation, optical instruments, and/or injection of steroids.
- Infants and children with chronic tracheostomy dependence often undergo interval rigid airway endoscopy for surveillance of complications of the tracheostomy tubes, such as suprastomal granulation tissue or tracheal erosion at the tip of the cuff of the tracheostomy tube.
- Patients with acute bacterial tracheitis often must undergo rigid tracheoscopy and bronchoscopy for débridement of thick mucopurulent secretions and desquamated epithelium.

- Patients with plastic bronchitis often require rigid airway endoscopy for débridement of obstructing bronchial casts. This relatively rare disorder, characterized by obstruction of the large airways by thick mucus plugs and bronchial casts, can occur in patients with asthma, cystic fibrosis, sickle cell disease with acute chest syndrome, and cyanotic congenital heart disease following palliation surgery.[8]
- Flexible bronchoscopy provides improved visualization of the distal airway.
- There are a variety of indications for flexible bronchoscopy, including chronic cough, recurrent pneumonia, unexplained or persistent wheezing, and hemoptysis.

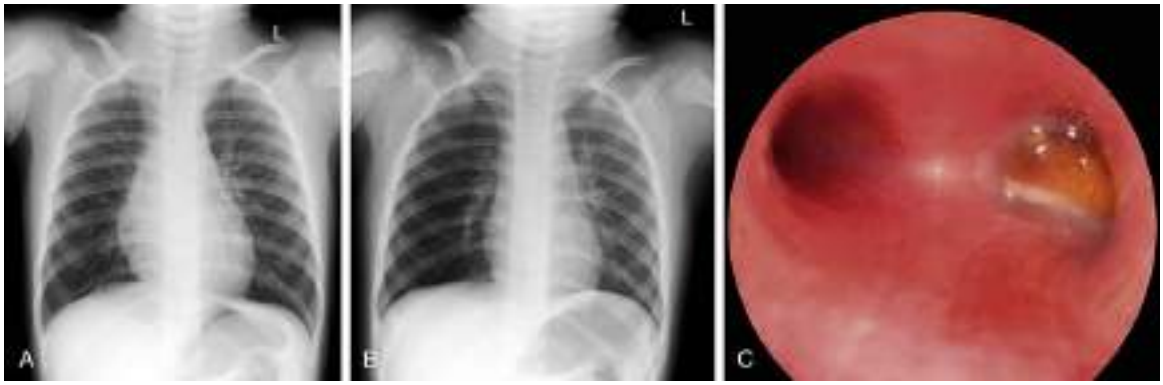

FIG. 198.1 Inspiratory, **A,** and expiratory, **B,** chest radiographs of a patient with an almond in the right main stem bronchus, demonstrating air trapping and hyperinflation of the right lung. **C,** Endoscopic view of the almond in the right main stem bronchus.

Contraindications

- Multiple medical comorbidities or medically fragile patients at significant increased risk for anesthesia (relative contraindication)
- Inability to extend the neck due to cervical spine instability, cervical spine fusion, or diseases involving the cranio-cervical junction (such as severe Chiari malformation) make rigid airway endoscopy challenging.

- Ankylosis of the temporomandibular joints or other abnormalities of the oral cavity and oropharynx, making direct laryngoscopy very difficult; flexible bronchoscopy can be an alternative in these patients

Preoperative Preparation

- History, physical examination, and imaging studies as described above
- Discussion of risks and benefits with patient and family. Risks of procedure include injury to the teeth, injury to the aerodigestive tract, inability to successfully remove a foreign body, and the possible need for open surgery.

Operative Period

Anesthesia

- Careful communication between the surgeon and anesthesiologist in airway endoscopy cases is critical.
- Avoid preoperative sedation in patients with stridor or a potential foreign body in the airway.
- In infants and children, induction is often performed with an inhalational anesthetic agent if there is not already intravenous access. Intravenous access should then be obtained prior to beginning the procedure.
- With a rigid ventilating bronchoscope, the patient can be ventilated, and oxygen and anesthetic gas can be administered through the bronchoscope. If there is a large leak around the bronchoscope, consideration should be given to turning off the anesthetic gas and using intravenous agents at that point, to prevent significant escape of anesthetic gas into the operating room environment.
- When there is a potential foreign body of the airway, spontaneous ventilation is preferred over an apneic technique.
- In a patient with a foreign body of the airway, it is ideal to avoid too much positive pressure ventilation to help prevent the foreign body

from being displaced more distally in the airway.

- The initial laryngoscopy in a patient with a foreign body of the airway should ideally be performed by the endoscopist rather than the anesthesiologist in case a foreign body is encountered in the larynx.

Positioning

- Patients are positioned supine on the operating table.
- For rigid airway endoscopy in infants and children, the head is extended, and a shoulder roll is placed.
- The head is typically placed in a gel ring to help stabilize it.

Perioperative Antibiotic Prophylaxis and Steroid Administration

- Antibiotic prophylaxis is not typically necessary for routine bronchoscopy and tracheoscopy procedures or for most foreign bodies of the airway, unless there is concern for an infection secondary to the foreign body.
- A dose of intravenous steroids is typically given at the beginning of the airway endoscopy procedure to help prevent or decrease edema of the airway and to help prevent postoperative nausea and vomiting.

Monitoring

- Standard monitoring (pulse oximeter, continuous electrocardiogram, core body temperature) for general anesthesia
- In rare instances when there is concern for instability of the cervical spine, after consultation with Neurosurgery, the head can be positioned and the procedure performed with somatosensory evoked potential (SSEP) monitoring. However, in these cases it is also important to limit head extension and to keep the neck in as neutral a position as possible.

Instruments and Equipment to Have Available

- Laryngoscope (either Philips or Miller laryngoscope from anesthesiology or Parsons laryngoscope). It is important to have an age-appropriate size.
- Hopkins rod telescope (0 degree)
- Rigid ventilating bronchoscopes with a 0-degree Hopkins rod telescope, camera, and video tower (Fig. 198.2)
- Rigid laryngeal and tracheal suction catheters
- Flexible suction catheters to fit through the side port of the bronchoscope
- Optical forceps (alligator, peanut, and cup) (see Fig. 198.2)
- Nonoptical forceps (forward grasping, rotation, globular object, hollow object) (see Fig. 198.2)
- Fogarty catheters for difficult distal foreign bodies
- Ureteral baskets for difficult distal foreign bodies
- Flexible fiberoptic bronchoscope

Key Anatomic Landmarks

- For direct laryngoscopy, the base of the tongue, vallecula, epiglottis, arytenoids, and true vocal folds are identified.
- For rigid bronchoscopy, the subglottis, trachea, carina, main stem bronchi, and lobar bronchi are important landmarks.

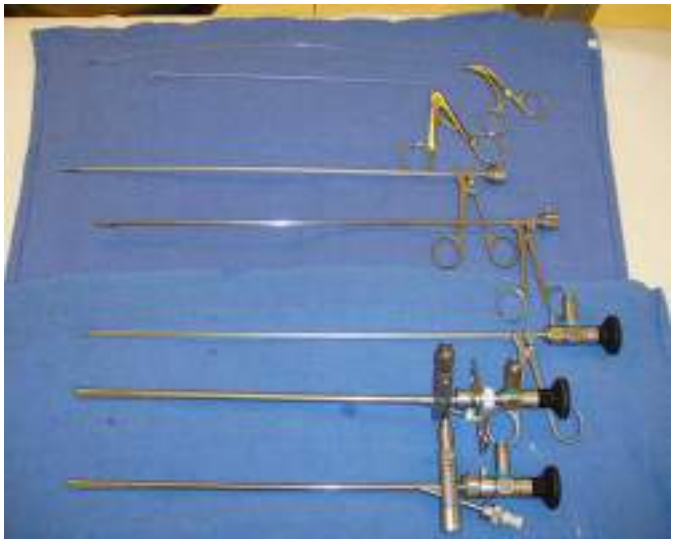

FIG. 198.2 Rigid bronchoscope, optical forceps, and nonoptical forceps used for rigid tracheoscopy and bronchoscopy with foreign body removal.

- For transnasal flexible fiberoptic bronchoscopy, the nasal cavity, nasopharynx, soft palate, epiglottis, arytenoids, and true vocal folds are visualized in passing the bronchoscope into the trachea.

Prerequisite Skills

- Direct laryngoscopy and flexible laryngoscopy in the pediatric age group
- Tracheostomy in the pediatric age group

Operative Risks

- Injury to the teeth
- Injury to the pharynx, larynx, trachea, or bronchi
- Bleeding into the airway
- Pneumothorax or pneumomediastinum
- Inability to remove the foreign body, requiring repeat endoscopy, thoracoscopy, or thoracotomy

Surgical Technique

Rigid Diagnostic Tracheoscopy and Bronchoscopy

- A tooth guard is inserted to protect the maxillary dentition. If there are no upper teeth, a moist gauze sponge is used.
- A direct laryngoscopy is performed with an anesthesia (i.e., Miller or Phillips) laryngoscope or otolaryngologic (i.e., Parsons) laryngoscope.
- The laryngoscope is inserted along the right side of the tongue, and the tongue is displaced to the left.
- The tip of the laryngoscope blade is then placed into the vallecula, and the epiglottis, arytenoids, and vocal folds are identified.
- A defogging solution is typically used to prevent condensation and clouding of the lens of the telescope.
- The telescope or rigid bronchoscope is then introduced transorally, and the oropharynx, hypopharynx, and larynx are examined (Fig. 198.3).
- The telescope or rigid bronchoscope is then advanced through the glottis. If a rigid bronchoscope is used, it should be advanced using the following technique:
  - The bronchoscope is turned 90 degrees counterclockwise to align the leading edge of the tip of the bronchoscope in a plane with the true vocal folds.
  - The tip of the bronchoscope is then passed beyond the true vocal folds and then rotated 90 degrees clockwise once the tip is in the subglottis.
  - This technique is used to avoid injury to the true vocal folds or vocal processes of the arytenoids by the tip of the bronchoscope (Fig. 198.4).
- Once the tip of the bronchoscope is in the trachea, the laryngoscope is removed, and the bronchoscope is supported by the thumb and forefinger to help protect the upper gingiva and teeth (Fig. 198.5).
- If the Hopkins rod is used for the bronchoscopy without a rigid bronchoscope, the laryngoscope is typically kept in place, and the

Hopkins rod is advanced to examine the trachea and bronchi.

- The rigid bronchoscope has a port for connection to the anesthesia circuit, and the patient can be ventilated through the bronchoscope. This aspect of the rigid bronchoscope allows it to be used to establish an airway in an emergent or difficult airway situation.
- The trachea, carina, and bronchi are examined with the telescope or rigid bronchoscope.

FIG. 198.3 The proper method for inserting a rigid bronchoscope after performing a direct laryngoscopy is demonstrated. The laryngoscope is inserted along the right side of the tongue, and the tongue is displaced to the left. The tip of the laryngoscope blade is then placed in the vallecula and the epiglottis, arytenoids, and vocal folds are identified. The telescope or rigid bronchoscope is then introduced transorally, and the oropharynx, hypopharynx, and larynx are examined.

- To examine the right main stem and lobar bronchi, the patient's head is turned to the left, and the tip of the bronchoscope is rotated clockwise.
- To examine the left main stem and lobar bronchi, the patient's head is

turned to the right, and the tip of the bronchoscope is rotated counterclockwise.

- Secretions can be removed through a long, rigid metal suction that fits through the main channel of the bronchoscope or through a flexible suction catheter that fits through the side port of the bronchoscope.

Flexible Bronchoscopy

- In children, this procedure is typically performed under general anesthesia.
- A flexible fiberoptic bronchoscope can be advanced transnasally, through the pharynx, and passed through the glottis into the trachea and bronchi.
- The flexible fiberoptic bronchoscope can also be passed through a laryngeal mask (LMA), endotracheal tube, or tracheostomy tube.
- Care must be taken to select a proper size bronchoscope that will fit through the LMA, endotracheal tube, or tracheostomy tube.
- Silicone lubricant is applied to the bronchoscope to facilitate passage through the LMA, endotracheal tube, or tracheostomy tube.
- A right-angled ventilation adaptor with a perforated rubber diaphragm can be placed on the LMA, endotracheal tube, or tracheostomy tube to allow the patient to be ventilated while the bronchoscope is in place.
- Topical lidocaine is applied to the vocal folds and carina through the side port of the bronchoscope.

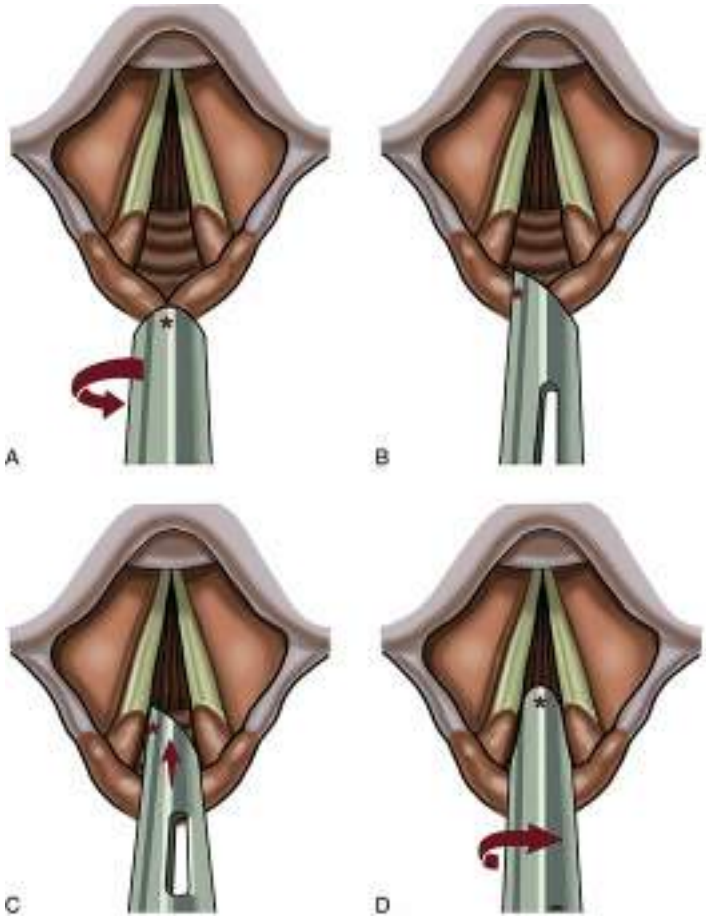

FIG. 198.4 Four-part illustration demonstrating the correct technique for advancing the rigid bronchoscope beyond the subglottis to avoid injury to the true vocal folds or vocal processes of the arytenoids. The bronchoscope is turned 90 degrees counterclockwise to align the leading edge of the tip of the bronchoscope∗ in a plane with the true vocal folds, **A** and **B**. The tip of the bronchoscope is then passed beyond the true vocal folds, **C,** and then rotated 90 degrees clockwise once the tip is in the subglottis, **D**.

FIG. 198.5 Once the tip of the bronchoscope is in the trachea, the laryngoscope is removed and the bronchoscope is supported by the thumb and forefinger to help protect the upper gingiva and teeth.

- A broncho-alveolar lavage can be performed through the side port of the flexible bronchoscope.
- Flexible bronchoscopy can be very useful in the diagnosis of airway abnormalities, particularly of the lower airway.
- Some therapeutic procedures, such as treatment with lasers, can be performed through a flexible bronchoscope.
- Flexible bronchoscopy is not typically a good technique for removing airway foreign bodies but may be an adjunct to rigid bronchoscopy for difficult distal foreign bodies.

Removal of a Foreign Body from the Airway

- Rigid bronchoscopy is the first-line therapy for all foreign bodies of the tracheobronchial tree; the technique can be both diagnostic and therapeutic.
- Rigid bronchoscopy is required when there is any suspicion of a foreign body of the airway; the technique should be strongly considered when the history, physical examination, or radiologic studies (any of the three) suggest a possible foreign body.

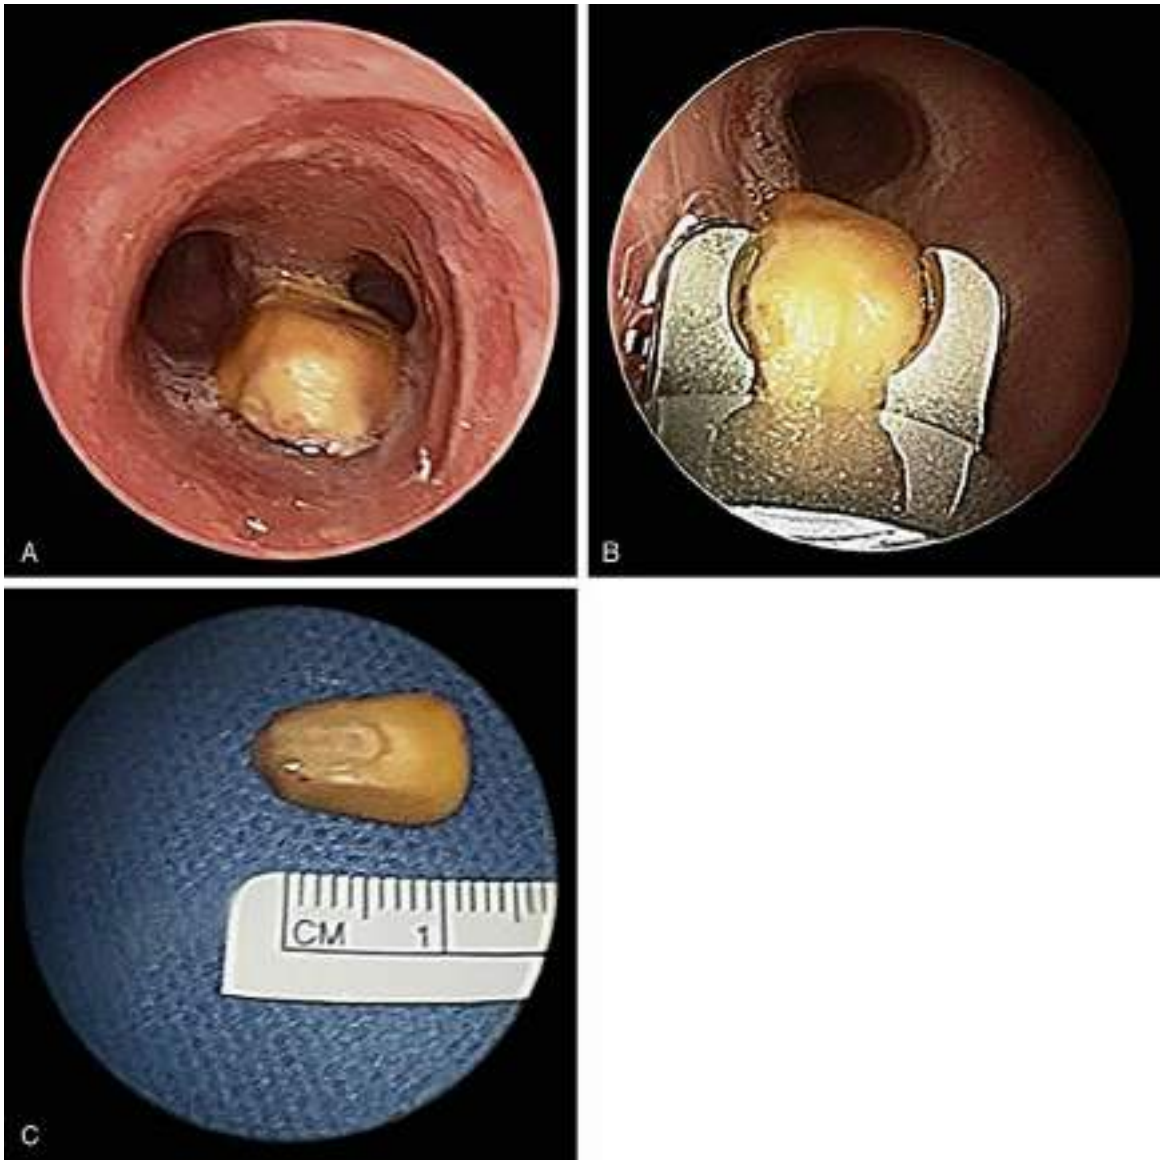

FIG. 198.6 **A,** Endoscopic view of a foreign body (dry corn kernel) in the distal trachea. **B,** The corn kernel is carefully grasped and removed with an optical peanut forceps. **C,** Corn kernel once removed from the airway.

- It is ideal to have an experienced endoscopist, Anesthesiologist, and OR team.
- Obtaining a duplicate foreign body from the caregivers can be very helpful in planning removal.
- Secretions are suctioned, and the shape and position of the foreign body are carefully assessed.
- Attempts should be made to protect sharp objects within the

bronchoscope or to allow their points to trail, to minimize injury to the mucosa.

- Care must be taken to avoid pushing the foreign body more distally.
- If possible, the foreign body should be rotated into the sagittal plane, which has the largest laryngeal diameter.
- The choice of instruments used through the bronchoscope depends upon the type of object aspirated. For example, peanuts and other nuts are often best grasped with optical peanut forceps. Sharp objects are often best managed with alligator forceps (Figs. 198.6 and 198.7).
- The foreign body should be carefully grasped under direct visualization with a Hopkins rod telescope through the bronchoscope.
- If the foreign body will fit into the sheath of the bronchoscope, it is safest to remove the foreign body, forceps, and bronchoscope *en bloc*, to help prevent the foreign body from getting stuck at the glottis, shearing off and moving distally, or lacerating the mucosa.
- If there is bleeding or granulation tissue around the foreign body, a vasoconstrictive agent such as oxymetazoline can be instilled.
- If the foreign body becomes dislodged in the subglottis or trachea during extraction and airway obstruction occurs, it may be easier to push the object back into the right main stem bronchus to allow ventilation before attempting to remove the foreign body again.

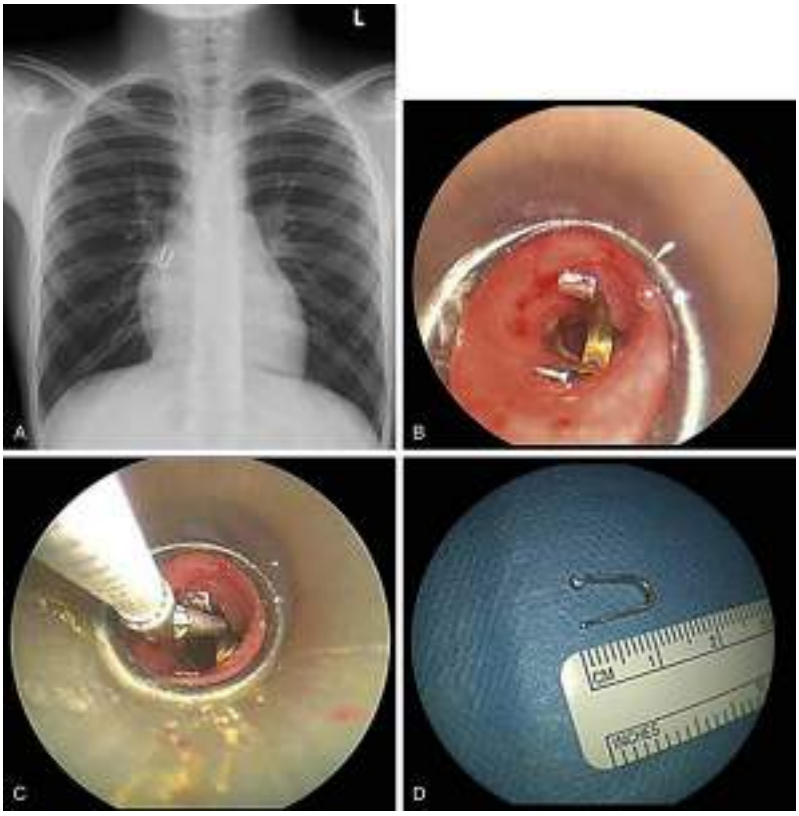

FIG. 198.7 **A,** Chest radiograph demonstrating a radiopaque foreign body (pen clip) in the right main stem bronchus. **B,** Endoscopic view of pen clip in right main stem bronchus. **C,** Metal pen clip is carefully grasped and removed with an alligator forceps. **D,** Metal pen clip once removed from the airway.

- A repeat rigid bronchoscopy should be performed once the foreign body is removed to evaluate for any injury or possible additional foreign bodies.
- If the entire foreign body cannot be removed because there is too much bleeding, edema, or granulation tissue present, the surgeon should safely remove as much of the foreign body as possible, observe the patient in the hospital for a few days on antibiotics and steroids, and then take the patient back to the operating room for another attempt at foreign body removal, once the inflammation has subsided.

Common Errors in Technique

- Failing to properly prepare for the removal of a foreign body of the

airway, including carefully checking equipment before the procedure

- Hastily grasping the foreign body, causing it to break into pieces or migrate distally
- Allowing the foreign body to become dislodged at the glottis/subglottis, leading to airway obstruction
- Failing to recognize that a foreign body was incompletely removed or that there is residual foreign body or an additional foreign body present

Postoperative Period

Postoperative Management

- Diagnostic rigid bronchoscopy can be performed as an inpatient or ambulatory procedure depending on the indications and age of the patient.
- Most patients under 6 months of age should be observed overnight with continuous pulse oximetry after rigid airway endoscopy to ensure that edema after instrumenting an already small airway does not lead to airway obstruction.
- Children with underlying significant airway abnormalities are often also observed overnight after rigid airway endoscopy, either in the ICU or on a regular floor, depending on the severity of their airway problems.
- Most children are observed overnight in the hospital after removal of a foreign body, although older children and adolescents with an otherwise normal airway can sometimes be discharged the same day after removal of the foreign body.
- A postoperative chest radiograph should be obtained after removal of a foreign body, particularly when there is any potential concern for complications such as pneumothorax, pneumomediastinum, or atelectasis.
- After removal of a foreign body, bronchodilators such as albuterol can be given when there is concern for bronchospasm.

- Several doses of corticosteroids can be administered after removal of a foreign body of the airway when significant edema of the airway is present.
- A course of antibiotics is often prescribed after removal of a foreign body, particularly if the foreign body has been present for a long period of time and there is suspicion for infection.

Complications

- See "Operative Risks" section for intraoperative complications.
- Early postoperative complications include atelectasis, wheezing, stridor, edema of the larynx, traumatic laryngitis, pneumonia, post-obstructive pulmonary edema, pneumothorax, pneumomediastinum, and lung abscess.
- Late postoperative complications include formation of a broncho-pleural fistula, stricture, and laryngotracheal stenosis.

Alternative Management Plan

- Rigid bronchoscopy is the first-line and criterion-standard therapy for the diagnosis and treatment of foreign bodies of the tracheobronchial tree.
- Radiographic studies may be useful but are not sufficiently sensitive or specific alone to predict the presence of an airway foreign body.
- Computed tomography (CT) scanning with or without "virtual bronchoscopy" can be useful in diagnosing some challenging or unusual foreign bodies of the airway.
- There are no good alternatives to rigid airway endoscopy for the initial management of foreign bodies of the airway.
- Rarely, a foreign body of the airway cannot be removed endoscopically, and a thoracotomy or thoracoscopic approach is necessary.

Discussion

Evidence-Based Medicine Question

The current literature suggests that all of the following are indications for rigid tracheoscopy and bronchoscopy EXCEPT:

A. Suspected foreign body aspiration

B. Subglottic web or stricture

C. **Inspiratory stridor from laryngomalacia**

D. Tracheostomy dependence with obstructing suprastomal granuloma

E. Unexplained biphasic stridor

F. Plastic bronchitis

Explanation: Answers A, B, D, E, and F are all indications for rigid tracheoscopy and bronchoscopy. Laryngomalacia (answer C) is typically diagnosed with flexible fiberoptic laryngoscopy in the office or at the bedside and does not usually require rigid airway endoscopy as part of the diagnosis, unless there are airway symptoms that are out of proportion to or inconsistent with the degree of laryngomalacia seen on flexible laryngoscopy.[1,9]

Editorial Comment

It is important for all Otolaryngologists to be familiar with the techniques of rigid tracheoscopy and bronchoscopy. These procedures are very important in the diagnosis and treatment of many airway disorders in infants and children.[1] Almost all children with biphasic or expiratory stridor should be evaluated using rigid tracheoscopy and bronchoscopy under general anesthesia.[1] Rigid bronchoscopy can also be a very useful method in establishing an emergent airway in patients with significant airway obstruction who cannot be intubated by traditional techniques. Flexible bronchoscopy is often performed by Pediatric Pulmonologists and can be a complementary technique to rigid airway endoscopy for evaluation of the airway in the pediatric age group.

Rigid airway endoscopy is the criterion standard for the management of foreign bodies of the airway, which can lead to significant morbidity and mortality in children.[2-5] A variety of techniques and instruments can

be used working through a rigid bronchoscope to extract foreign bodies of the airway. Although history, physical examination, and radiographic findings are important in the evaluation of a child with possible aspiration of a foreign body, there needs to be a high index of suspicion and a low threshold for rigid endoscopy to optimize outcomes.

Review Questions

1. The most common site for an airway foreign body is the:

   a. Trachea

   b. **Right main stem bronchus**

   c. Glottis

   d. Left main stem bronchus

2. The best method to evaluate a child with biphasic stridor is:

   a. In the office with flexible fiberoptic laryngoscopy

   b. In the operating room with flexible bronchoscopy

   c. **In the operating room with rigid tracheoscopy and bronchoscopy**

   d. In the radiology suite with fluoroscopy

3. Which of the following is a contraindication for rigid bronchoscopy?

   a. Age under 3 months

   b. Stridor and respiratory distress

   c. History of previous tracheotomy

   d. **Inability to extend the neck due to instability of the cervical spine**

4. Which of the following is the most common abnormality seen on chest radiographs in patients with aspiration of a foreign body?

   a. **Air trapping/hyperinflation**

   b. Radiopaque foreign body

c. Widening of the mediastinum

d. Mediastinal shift toward the side of the foreign body

5. All of the following are potential *early* postoperative complications after removal of a foreign body, except

a. Edema of the larynx

b. Post-obstructive pulmonary edema

c. Pneumothorax

d. **Stricture formation**

Management of Tracheal Stenosis

Carlton J. Zdanski, and Jonathan Walsh

Introduction

Pediatric tracheal stenosis is the clinical presentation of a diverse and complex spectrum of disease processes. Etiologies range from iatrogenic injury, trauma, infection, congenital malformations, neoplasms, gastroesophageal reflux disease (GERD), autoimmune processes, and granulomatous diseases. Classification is necessary in order to better define the stenosis and the spectrum of causes and to determine appropriate management. Stenosis can be classified as acquired versus congenital, intraluminal versus cartilaginous framework versus extrinsic compression, and short versus long segment.

The pathogenesis of acquired stenosis includes injury to the tracheal lining or its cartilaginous framework, resulting in scarring or loss of support. The laryngotracheal cartilaginous framework depends on the perichondrium for its blood supply. Ischemic cartilage can lose its mechanical integrity and collapse, thereby leading to a functional stenosis. Furthermore, exposed cartilage deprived of its blood supply can necrose rapidly and act as a foreign body; the ensuing inflammatory reaction causes further tissue destruction and scarring. This injury can result in a variety of stenoses ranging in severity from thin tracheal webs to severe long-segment stenosis.[1,2]

Congenital tracheal stenosis (CTS) results from tracheomalacia, external vascular compression or rings, tracheal hypoplasia, funnel stenosis, segmental stenosis, complete tracheal rings, and tracheal agenesis. Cantrell and Guild[3] first described intrinsic congenital tracheal stenoses and classified them into three morphologic types: (1) generalized hypoplasia, (2) funnel stenosis, and (3) segmental stenosis (Fig. 199.1).

An in-depth discussion of the pathogenesis of tracheal stenosis is beyond the scope of this chapter. With regard to CTS, the definitive pathogenesis is unknown. Additionally, several theories of embryologic tracheal development are still being debated.

Surgical techniques available for management of tracheal stenosis are endoscopic dilation, endoscopic stent placement, costochondral cartilage tracheoplasty, pericardial patch tracheoplasty, tracheal autograft tracheoplasty, tracheal resection with reanastomosis, and slide tracheoplasty. There have also been a few reports of tracheal transplantation for extreme cases. Many forms of acquired stenosis are amenable to endoscopic management. Although small-segment acquired tracheal stenosis may be amenable to balloon dilation, this technique is not recommended for the treatment of complete tracheal rings. Slide tracheoplasty and tracheal resection with reanastomosis have evolved as the current recommended primary open techniques for pediatric tracheal stenosis and owing to their wide acceptance and application; these techniques are discussed in this chapter.

Key Operative Learning Points

1. It is essential in management decision making to classify the stenosis with the etiology, degree of narrowing, length of stenosis, and whether it is intraluminal or involves deformed cartilage.

2. Slide tracheoplasty is the surgical treatment of choice for long-segment stenosis and complete tracheal rings; it can be used for a variety of lengths of stenosis.

3. For mild stenosis of the trachea, observation can be a safe and reasonable option.

4. Some 50% to 70% of congenital tracheal stenoses have associated cardiovascular malformations; preoperative cardiac evaluation is recommended.

5. Previous open airway surgery or chest surgery has produced a scarred or shortened trachea, which can make resection with anastomosis difficult or impossible to perform.

Preoperative Period

History

1. History of present illness

   a. What symptoms are present? The degree of dysfunction and therefore the clinical manifestations of tracheal stenosis vary widely. Patients with tracheal stenosis may complain of shortness of breath, dyspnea on exertion, expiratory or biphasic stridor, hoarseness, dysphagia, aspiration, difficulty clearing secretions, recurrent pneumonia, or any combination of these symptoms and signs. Children often have a history of recurrent croup or cardiopulmonary problems. Symptom severity likely correlates with degree of stenosis.[1,2]

   b. Are symptoms present at rest? Symptoms result from a narrowed airway lumen, which limits the physiologic demands of mucociliary clearance, tidal volumes, and gas exchange. It is generally estimated that the presence of symptoms with activity indicates a 50% stenosis of the tracheal lumen; symptoms at rest occur with a 75% stenosis.

   c. What was the age of symptom onset? Neonatal: Typically severe stenosis and critically ill. Cantrell and Guild[3] type 1 occurs more commonly and is often accompanied by significant cardiovascular malformations. There is a 70% to 100% mortality when patients with CTS present in a critically ill state.[2] Infancy: Stenosis symptoms present at several months of age, when there is an increase in physical activity and tidal volumes. Childhood/adolescence: Often incidental findings, present with mild symptoms and typically mild stenosis. Exercise-associated symptoms are common.[2]

   d. What is the severity of symptoms and quality of life effects?

      1) Are there frequent emergency department visits? Admissions? Treatments?

      2) What exacerbates the symptoms? Activity? Infection? Position?

2. Past medical history

   a. Birth history of prematurity or admissions to the neonatal intensive

care unit (Neonatal Intensive Care Unit)

b. Recurrent croup

c. Apparent life-threatening events (ALTEs)

d. Other congenital malformations: Stenoses are associated with pulmonary, cardiovascular, and gastrointestinal malformations.

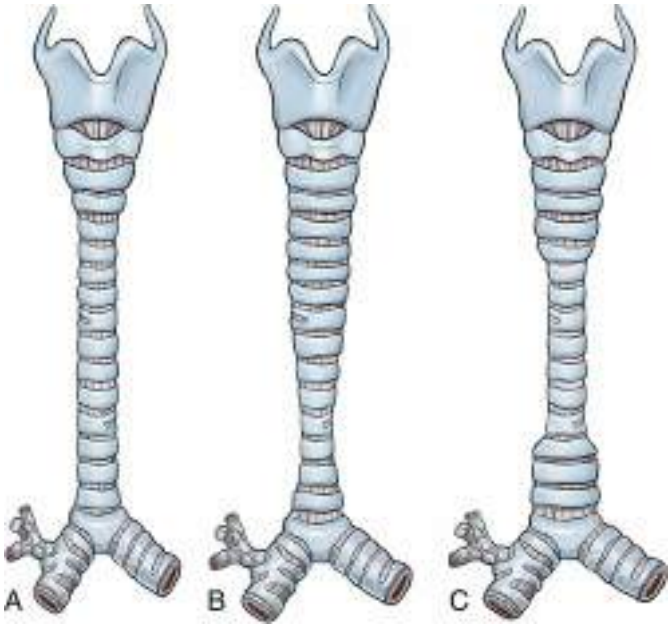

FIG. 199.1 Cantrell and Guild congenital tracheal stenosis classification: **A,** generalized hypoplasia, **B,** funnel stenosis, **C,** segmental stenosis.

e. Intubations: Multiple factors play a role in the etiology of tracheal stenosis after endotracheal intubation. Time of intubation, size of the tube relative to the airway, pressure and friction by the tube or cuff, repeated intubation, foreign-body reaction to the tube, release of toxic substances used for sterilization, use of a stylet, route of intubation (nasal or orotracheal), nursing care techniques (suctioning, fixation), and anatomic differences between the genders are among many important factors that can be correlated with the development of postintubation stenosis. Because the microcirculation of the tracheal mucosa is impaired at a pressure of 30mm Hg, a low-volume, high-pressure cuff is more likely to cause an ischemic injury than a high-volume, low-pressure cuff. Nonetheless, an overinflated, high-volume cuff can impede the

microcirculation and produce the same injury as a low-volume cuff.

f. Infections or autoimmune disorders: Tuberculosis, histoplasmosis, blastomycosis, diphtheria, leprosy, and syphilis are endemic in several parts of the world. Stenosis due to inflammation, chondritis, or necrosis can occur. Diseases such as relapsing polychondritis and Granulomatosis polyangiitis (GPA) can destroy the cartilaginous framework and thereby lead to collapse of the airway. Stenosis occurs in 10% to 20% of patients with Granulomatosis polyangiitis, and the mainstay of treatment remains medical. These causes are important to identify preoperatively because tracheal repair in an active state of disease can exacerbate the disease or predispose to restenosis.

3. Past surgical history

   a. Bronchoscopies

   b. Endoscopic airway procedures

   c. Open airway reconstruction

   d. Tracheostomies

   e. Tracheoesophageal fistula (TEF) repair

   f. Cardiothoracic surgery

4. Medications

   a. H2 blockers/proton pump inhibitors (PPIs)

   b. Steroids

   c. Inhaled/nebulized bronchodilators

Physical Examination

1. General

   a. Weight/height/growth curve

2. Respiratory

   a. Tachypnea

   b. Expiratory or biphasic stridor

c. Biphasic wheezing

d. Tripod positioning

e. Nasal flaring

f. Intercostal, sternal, or suprasternal retractions

g. Cyanosis

3. Face and oral cavity: Examination can reveal additional sites of airway obstruction and possibilities of a difficult airway, such as craniofacial abnormalities, trismus, retrognathia, micrognathia, or tonsillar/lingual hypertrophy.

4. Neck: Scars, length, restriction of mobility, tracheostomy. These findings can indicate prior surgical interventions as well as the feasibility of future procedures.

5. Fiberoptic laryngoscopy: Evaluate for vocal fold mobility, upper airway sites of obstruction, and glottic lesions.

6. Laryngoscopy/bronchoscopy: Visualization is crucial in determining laryngomalacia, tracheomalacia, length of stenosis, grade of stenosis, dynamic or static stenosis, thin webs, fresh versus mature stenosis, or complete tracheal rings. It is of utmost importance to avoid trauma to the mucosa of the stenosis during examination, especially with complete tracheal rings. Any worsening edema or scarring may create an unstable airway that can be extraordinarily difficult to manage. Consider passing a scope through the stenotic segment only if it can be passed with minimal contact and no trauma to the surrounding mucosa. Otherwise distal evaluation of the airway during bronchoscopy should be avoided. Fig. 199.2 demonstrates the endoscopic view of complete tracheal rings and complex tracheal stenosis. Video 199.1 demonstrates a bronchoscopic examination of complete tracheal rings.

Imaging

Chest radiograph: Plain films can help to evaluate the extent of the lesion, external compression, or pneumonia. In small children, soft tissue radiographs may be sufficient to localize and grade the stenosis with the addition of direct visualization.

Computed tomography (CT)/CT angiography (CTA)/magnetic resonance imaging (MRI): If the patient's status allows for imaging, CT and MRI can provide excellent evaluations of tracheal lesions as well as possible cardiovascular anomalies. Some 50% to 70% of CT examinations show associated cardiovascular malformations.[4] CT better ascertains the integrity of the cartilaginous framework. Spiral CT with three-dimensional reconstruction enables evaluation of the extent, shape, and site of the stenosis (Fig. 199.3). Although for narrow stenosis it may lack adequate spatial resolution, three-dimensional reconstruction allows for the possibility of "virtual" endoscopy. MRI allows direct imaging in the sagittal and coronal planes, which may be useful in planning treatment. Limitations of MRI are both the long scanning time and artifacts created by cardiac and respiratory movement; however, it can offer better detail of cardiovascular anomalies.

Pulmonary function testing with flow-volume loops: Useful in cases of mild to moderate stenosis with symptoms presenting later in life (Fig. 199.4)

Echocardiography: Obtained to evaluate for a high incidence of cardiovascular anomalies

Esophagogastroduodenoscopy (EGD): If symptoms of reflux, food intolerance, and significant airway edema are present, then a gastrointestinal (GI) evaluation for uncontrolled reflux or eosinophilic esophagitis and its management is warranted. Chronic inflammation from pepsin and acid can contribute to mucosal injuries and exacerbate existing stenosis. Patients with stenosis should be carefully monitored and aggressively treated for gastroesophageal reflux and eosinophilic esophagitis.

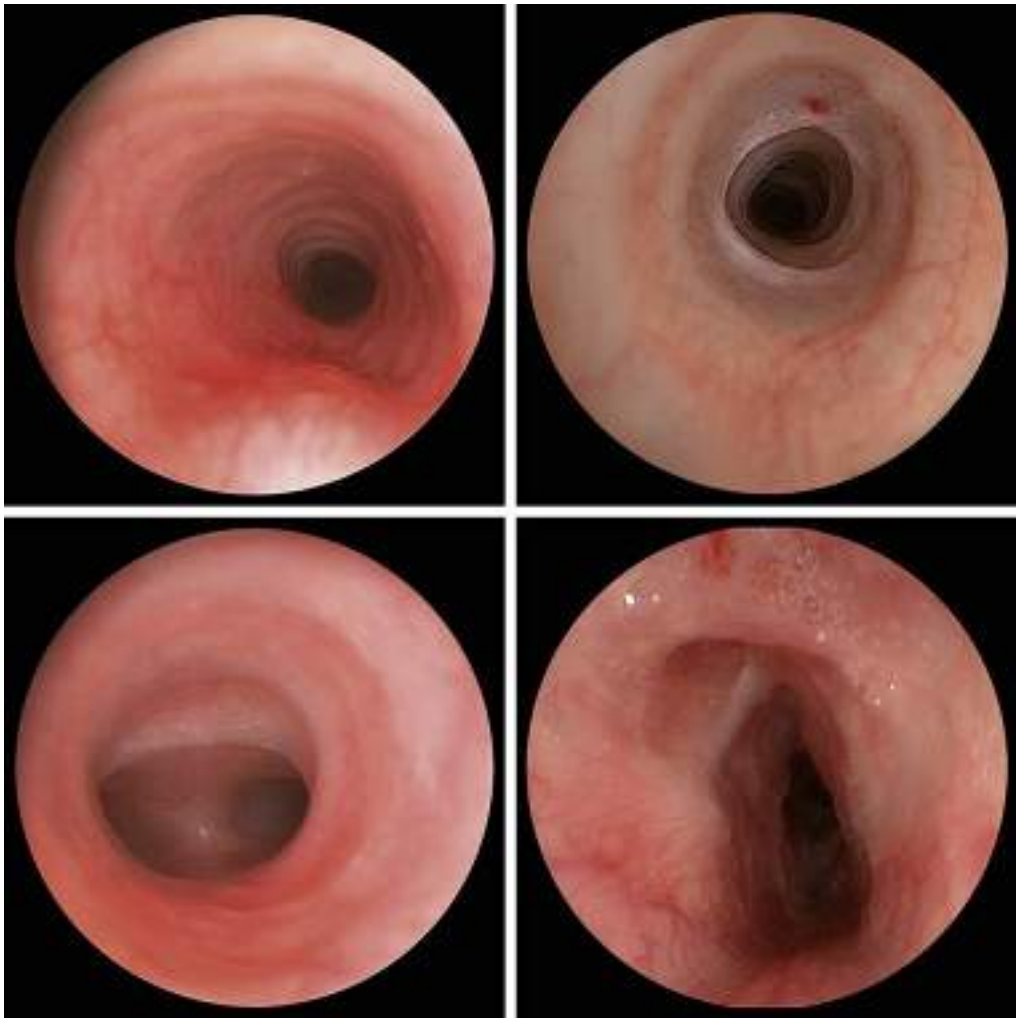

FIG. 199.2 Endoscopic images of tracheal stenosis (clockwise from top left): Complete tracheal rings viewed from upper trachea, complete rings midtrachea, complete rings distal trachea, complex tracheal stenosis with scarring.

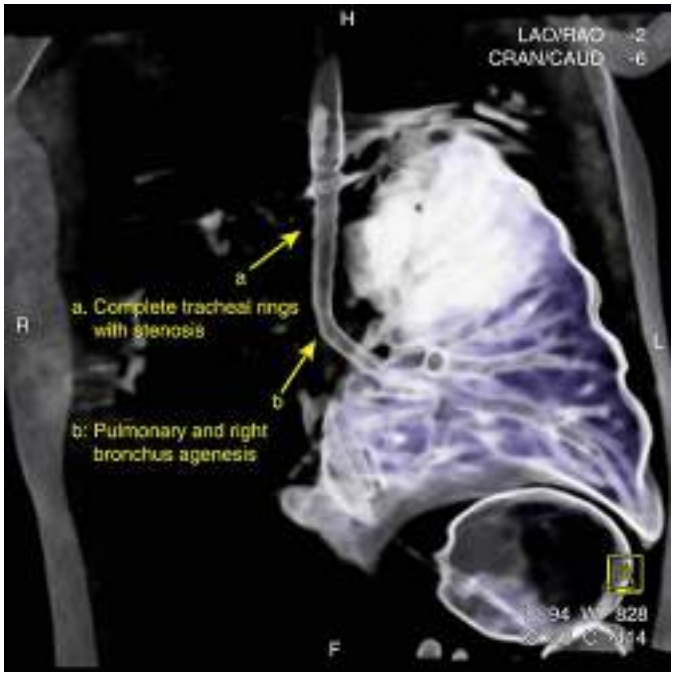

FIG. 199.3 High-resolution CT with 3D airway reconstruction demonstrating tracheal stenosis.

Laboratory data: Complete blood count, coagulation studies, and blood chemistry are needed if significant blood loss is expected or if cardiovascular anomalies are being simultaneously repaired with cardiopulmonary bypass (CPB) or extracorporeal membrane oxygenation (ECMO).

Indications

1. Critical stenosis with or without underlying cardiovascular anomalies

2. Symptomatic stenosis with significant impairment in quality of life

3. Neonatal stenosis with anticipated symptoms and future respiratory impairment

Contraindications

1. Unstable, critically ill patients with multiple comorbidities who are unable to tolerate surgery

2. Incidental stenosis without symptoms or expected future risk

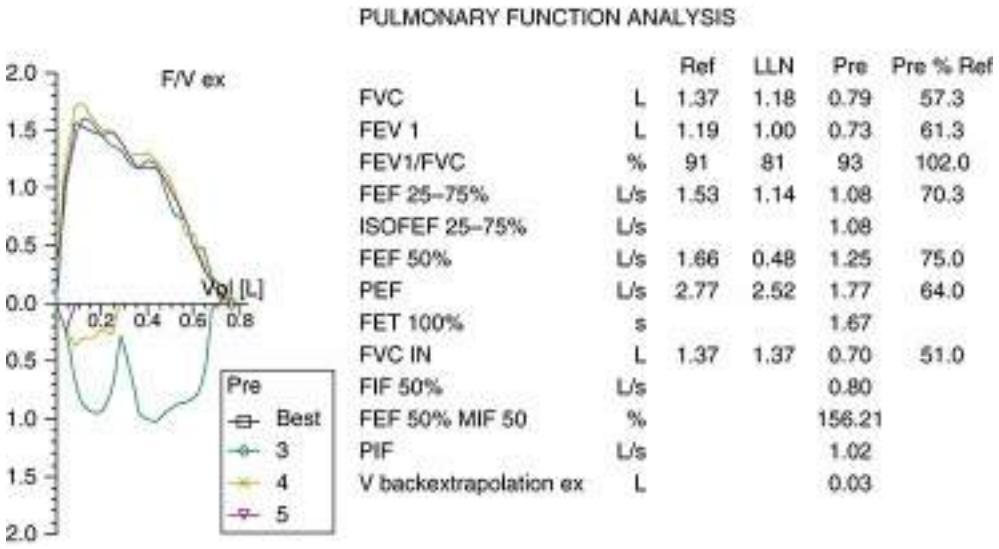

FIG. 199.4 Flow-volume loop in a patient with mild tracheal stenosis demonstrating flattening of inspiratory and expiratory phases.

Preoperative Preparation

1. Establish an airway management algorithm for the procedure and coordinate the plan with the anesthesiology team.

2. Determine if CPB or ECMO will be needed for surgical access or for any combined cardiovascular procedures.

3. Consider screening for methicillin-resistant *Staphylococcus aureus* (MRSA), *Pseudomonas*, and gram-negative bacterial colonization.

Operative Period

Anesthesia

General: General anesthesia with spontaneous ventilation if bronchoscopy is to be performed initially. If bronchoscopy is to be performed after CPB/ECMO, intubate above the stenotic segment until bypass is initiated.

Positioning

Supine: The patient is positioned with a shoulder roll and neck extension to allow for full access to the trachea.

Perioperative Antibiotic Prophylaxis: Clean-Contaminated Case Classification

Baseline: Ampicillin/sulbactam or third- or fourth-generation cephalosporin + metronidazole

MRSA-positive or high risk: Vancomycin or clindamycin

Pseudomonas risk: Piperacillin/tazobactam or third- or fourth-generation cephalosporin + metronidazole or fluoroquinolone (depending on local resistance patterns)

Penicillin allergy: Clindamycin

There are several factors to consider in choosing perioperative antibiotics. Head and neck cases are considered clean-contaminated and cefazolin alone is most often recommended. However, patients with airway stenosis have been demonstrated to have as much as 30% MRSA colonization.[5] Additionally, stenotic segments have increased rates of biofilms and colonization of gram-positive, gram-negative, and anaerobic bacteria. Tracheostomy tubes or long-standing endotracheal stents have increased rates of biofilms as well as *Pseudomonas* colonization. Although there are no specific guidelines for antibiotic prophylaxis in pediatric airway surgery owing to the increased risk of colonization, a directed prophylaxis at these high-risk patients is appropriate.

Monitoring

None necessary

Instruments and Equipment to Have Available

1. Endoscopic/bronchoscopic/emergency airway surgery cart

2. CO_2 laser

3. Airway balloons
4. Rapid ability to place patient on CPB or ECMO if necessary
5. Pediatric (cardiac) anesthesia

Key Anatomic Landmarks

1. Cricoid cartilage
2. Carina
3. Tracheal rings
4. Posterior tracheal membrane
5. Sternum

Prerequisite Skills

1. Endoscopic laryngoscopy and bronchoscopy
2. Endoscopic airway management
3. Open airway reconstruction

Operative Risks

1. Airway obstruction
2. Tracheal perforation
3. Airway bleeding
4. Tracheal dehiscence
5. Tracheitis
6. Mediastinitis
7. Granulation tissue
8. Tracheomalacia
9. Restenosis (circumferential or figure of eight)

10. Injury to the recurrent laryngeal nerves

11. Pneumothorax

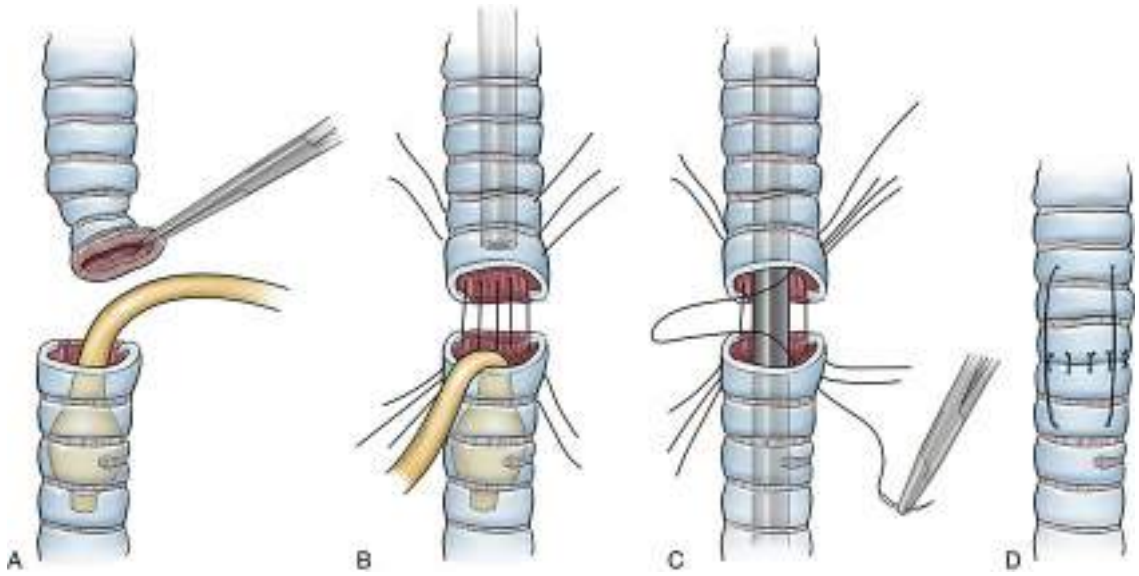

FIG. 199.5 Tracheal reanastomosis steps: **A,** dissection and resection of stenotic segment, **B,** placement of posterior sutures approximating trachealis muscle, **C,** placement of sutures approximating tracheal rings, **D,** closure of trachea and supporting sutures.

Surgical Technique

Segmental Resection and Reanastomosis

- Perform diagnostic laryngoscopy/bronchoscopy.
  - Confirm the lesion's characteristics and classification.
  - Obtain cultures from the airway for postoperative culture-directed antibiotics if needed.
  - Intubate with direct visualization. Use a smaller tube below the stenosis for mild to moderate stenosis. Use a larger tube above the stenosis for moderate to severe stenosis.
- A horizontal incision is made through the skin and subcutaneous adipose tissue of the lower neck.

- Strap muscles are identified and divided vertically at the midline raphe.
- The trachea is isolated above and below the stenosis; anterior dissection is performed from hyoid bone to the needed release inferiorly.
- The total length of excision needed is identified (up to 30% of the trachea may be excised safely).[6]
- Only the area of lateral trachea that is to be resected is dissected in order to preserve the lateral blood supply for the remaining trachea. For circumferential lesions, the posterior trachealis muscle is dissected from the esophagus.
- The endotracheal tube (ETT) is pulled back above the stenosis.
- 2-0 Prolene suture(s) are placed into the inferior trachea vertically as safety traction suture(s).
- Division of the trachea with a #15 blade. May leave the posterior wall of the trachea if it is not involved in the stenosis (Fig. 199.5A)
  - This may be a horizontal resection or vertical incision to define the intraluminal extent of stenosis.
- The stenotic segment of the trachea is excised (see Fig.199.5B).
- A new ETT is placed via the neck into the distal trachea for ventilation.
- Tension-free approximation of the tracheal segments is ensured.
  - If there is too much tension, releasing maneuvers can be performed.
    - Anterior tracheal dissection is continued down to the carina/peritracheal release.
    - Suprahyoid release, first described by Montgomery in 1974, causes less dysphagia than infrahyoid techniques.
    - Infrahyoid release
- Interrupted 4-0 Vicryl sutures are placed posteriorly to close the tracheal mucosa.
- The patient is intubated transnasally with a new appropriate-sized ETT to be used as postoperative stenting; distal ETT is removed.
- Interrupted 3-0 and/or 4-0 Vicryl and/or PDS sutures are placed

circumferentially between the superior and inferior segmental rings. They are placed submucosally in order to avoid intraluminal sutures as possible sites for the formation of granulation tissue. Knots should be extraluminal (see Fig. 199.5C).

- Two to three submucosal sutures through two rings above and below the anastomosis are placed as additional supporting sutures to limit tension (see Fig.199.5D).
- The site is irrigated thoroughly.
- Anastomosis leak is tested with Valsalva.
- Repair can be augmented with fibrin glue application.
- Strap muscles are reapproximated.
- A passive surgical drain is used.
- The skin is closed.
- Chin-to-chest sutures (Grillo sutures) are used by some.

Slide Tracheoplasty

- Diagnostic laryngoscopy/bronchoscopy is performed.
  - Some centers use bronchograms for atraumatic diagnosis and evaluation of severity of lesion.
  - The lesion's characteristics and classification are confirmed.
  - Airway cultures for postoperative culture-directed antibiotics are obtained if needed.
  - The patient is intubated under direct visualization. For mild to moderate stenosis, a smaller tube is used below the stenosis. For moderate to severe stenosis, a larger tube is used above the stenosis.
- If CPB/ECMO is to be used or sternotomy, pediatric cardiothoracic surgeons perform median sternotomy, cannulate, and expose the entire trachea.
- Any comorbid cardiovascular anomalies are repaired.
- If CPB/ECMO and sternotomy are not needed, a horizontal neck

incision through the skin in the lower neck and subcutaneous adipose tissue is made.

- Strap muscles are identified and divided vertically at the midline.
- The trachea is divided above and below the stenosis; anterior dissection is performed from hyoid to point inferiorly.
- The ETT is pulled back above the stenosis if the patient is not on CPB/ECMO.
- The superior, midpoint, and inferior extent of the stenosis are confirmed with bronchoscopy and 27- or 30-g needle placement through the trachea.
  - Some complete rings may be subtle when viewed endoscopically, and the extent of the lesion may be underestimated.
- Once the midpoint has been confirmed, the area of stenotic trachea to be divided is dissected. Circumferential dissection of the entire trachea is to be avoided to prevent injury to the lateral blood supply and recurrent laryngeal nerves.
- Large 2-0 Prolene sutures are placed into the inferior trachea vertically through 3 tracheal rings as safety traction sutures.
- The trachea is divided at the midpoint of stenosis with a #15 blade (Fig. 199.6A).
- A vertical incision is made on the anterior wall of the distal trachea for the entire length of the stenosis. This incision can be extended into a bronchus if needed (*Note:* Many surgeons reverse the orientation and make the vertical incision on the anterior wall of the proximal trachea and the posterior wall of the distal trachea. This decision is made based on the characteristics of the stenosis and surgeon's preference) (see Fig. 199.6B).
- A new ETT is placed via the neck into the distal trachea for ventilation.
- A vertical incision is made on the posterior wall of the proximal trachea for the entire length of the stenosis (*Note:* See variation of technique in step above) (see Fig. 199.6C).
- The distal and proximal segments are trimmed to facilitate an airtight closure without overlapping of segments.

- Tension-free approximation of tracheal segments is ensured (see Fig. 199.6D). In general, slide tracheoplasty has less need for releasing maneuvers, as the length of pull is 50% of the length of the stenosis. Additionally, the tension is spread over a longer length of anastomosis compared with tracheal resection techniques.
  - If there is too much tension, releasing maneuvers can be performed.
    - Anterior tracheal dissection is continued down to the carina/peritracheal release.
    - Suprahyoid release
    - Infrahyoid release
- The trachea is anastomosed with running double needle 4-0 PDS sutures or interrupted 3-0 or 4-0 PDS sutures placed circumferentially between the superior and inferior segment rings submucosally. Intraluminal knots are to be avoided and also the placement of knots near vascular structures (see Fig. 199.6E).
- The patient is intubated transnasally, with a new appropriate-sized ETT to be used as postoperative stenting prior to completing the anastomosis.
- The ETT is placed under direct visualization at the midpoint of the anastomosis and the distal ETT (if used) is removed.
- The site is thoroughly irrigated.
- Anastomosis leak is tested with Valsalva.
- Repair can be augmented with fibrin glue application.
- The proximal and distal limits of the repair may be marked with clips for postoperative x-ray visualization and ETT repositioning.
- The strap muscles are reapproximated.
- A passive surgical drain or suction drains are used in the setting of sternotomy.
- The skin is closed.
- Chin-to-chest sutures (Grillo sutures) are used by some.

Common Errors in Technique

1. Incorrectly classifying the degree and extent of the stenosis

2. Incorrectly identifying the midpoint of the stenosis prior to dividing the trachea for slide tracheoplasty

3. Underestimating the length of the stenosis and number of complete rings

4. Performing excessive dissection of the trachea, thus disrupting the lateral blood supply

5. Leaving a repair with too much tension without performing adequate releasing techniques

Postoperative Period

Postoperative Management

1. The patient is admitted to the Cardiothoracic intensive care unit/Pediatric intensive care unit (CTICU/PICU).

2. Chin-to-chest sutures (Grillo sutures) and/or passive neck flexion with a pillow may be used to maintain or limit suture tension.

3. Humidified saline air/oxygen or ventilation is utilized to limit mucosal drying.

4. Sedation and mechanical ventilation are applied as needed; older children or adults may not require either.

5. Antireflux medication may be given.

6. Depending on the patient's preoperative respiratory status, the cardiovascular comorbidities repaired, and the length of stenosis repaired, some patients can be extubated on the postoperative day; many patients will remain intubated for 7 to 10 days. Extubation typically is performed within 24 to 48 hours postoperatively for slide tracheoplasty and 0 to 7 days for tracheal resection.

7. Postoperative antibiotics are continued for 7 days or longer if

endotracheal tube intubation was prolonged.

8. Optional direct laryngoscopy and bronchoscopy in the operating room in 5 to 7 days for inspection of anastomosis and granulation tissue; extubation if there is appropriate tissue healing. Many patients may be reintubated with a 0.5-size smaller endotracheal tube for an additional 24 hours prior to extubation. Dexamethasone 0.5 mg/kg or appropriate dose every 8 hours for 24 hours prior to extubation is recommended.

9. Prior to feeding, a flexible laryngoscopy is performed to confirm vocal cord function.

10. A formal feeding evaluation for symptoms of dysphagia, aspiration, or vocal cord impairment should be obtained.

11. Repeat a direct laryngoscopy and bronchoscopy in 4 weeks to evaluate the anastomosis. Be prepared for balloon dilation, laser removal of granulation tissue, and possible steroid injection and mitomycin-C application as needed. The timing of follow-up endoscopies will be determined by findings at this time.

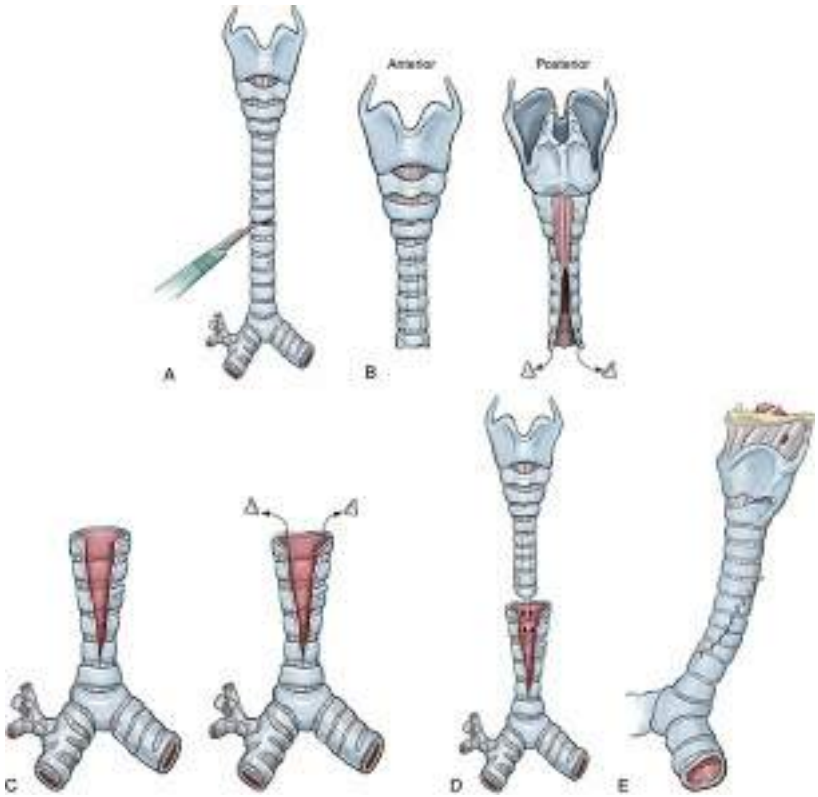

FIG. 199.6 Slide tracheoplasty steps: **A,** isolation and

identification of stenosis midpoint, **B,** posterior vertical incision of proximal segment and trimming,* **C,** anterior vertical incision of distal segment and trimming,* **D,** sliding of segments for anastomosis, **E,** lateral view of suture closure after completion of anastomosis (*see note in text for technique variation).

Complications

1. Airway hemorrhage: Fresh clot can easily occlude an airway, especially if dry. Frequent suctioning and aggressive humidification or saline nebulizers are needed.

2. Tracheal dehiscence: Treatment depends on the timing and size of the defect. In general, continuation of appropriate antibiotics until the airway is healed is recommended. If it is noted at the time of surgery, then correction at that time is recommended. If dehiscence is noted in the early postoperative period (<7 days), confirmation of the extent of the defect and whether there are signs of infection by direct laryngoscopy and bronchoscopy is needed. An endotracheal tube can be passed beyond the defect for distal ventilation and airway stenting until the airway has healed. It is important to avoid high-pressure ventilation. This may require ECMO if ventilation is not adequate. If there is a late dehiscence (>7 days), there should be a strong suspicion for infection and chondritis. Treatment may require neck or mediastinal washout, longer-term airway stenting, revision surgery, and long-term ECMO. Postoperative infections and dehiscence are more often associated with both MRSA and *Pseudomonas* infections. Preoperative cultures to evaluate and treat for these organisms prior to repair (if possible) are recommended.

3. Granulation tissue: On follow-up direct laryngoscopy/bronchoscopy (DLB) at 4 weeks postoperatively, granulation tissue can be removed gently with débridement, cup forceps, or gentle laser ablation. One must be careful to not induce more trauma to the mucosa and tracheal cartilage and further chondritis.

FIG. 199.7 Endoscopic view of figure-of-eight deformity following slide tracheoplasty.

4. Restenosis: Both repair techniques are at risk for restenosis. With tracheal resection and reanastomosis, the repair is typically in the horizontal plane. One may see circumferential stenosis that can be dilated with airway balloons. For slide tracheoplasty techniques, the repair suture line is on an oblique plane. Less circumferential stenosis is noted, but the lateral anastomotic edges can fold inward, creating a figure-of-eight deformity (Fig. 199.7). Although most figure-of-eight tracheas do not require treatment, a trachea can be dilated with airway balloons if needed. Adjunctive treatments with steroid injection or topical mitomycin-C can be applied in these settings.

5. Pneumonia may occur at a high rate, as many patients are colonized with organisms, are ventilated postoperatively, and may have had blood and secretions in the distal airway secondary to surgery.

6. Postextubation narcotic withdrawal occurs frequently in patients who require sedation and ventilation and should be appropriately identified and treated.

Alternative Management Plan

1. Observation. For mild stenosis with limited symptoms, conservative management has been proven to be safe. Additionally, some amount of tracheal growth may occur.[7]

2. Tracheal stenting. For patients too critically ill for surgical repair, temporizing measures with endoscopically placed stents can be utilized. Biodegradable stents should be considered over permanent stents, which are associated with a higher rate of potentially devastating complications.

Discussion

Evidence-Based Medicine Question

What percentage of tracheal length can be managed with tracheal resection and reanastomosis?

Based on retrospective data, typically 30% or more was the point at which postoperative complications increased. This percentage was determined by dividing the length of resection by the patient's age and tracheal length nomograms. Once 30% or greater trachea was resected, postoperative airway complications increased from 13% to 46%. The conclusions based on the investigators' retrospective data were that "children tolerate anastomosis tension less well than adults; resections [of] more than 30% have a substantial failure rate."

Wright C, Graham B, Grillo H, et al.: Pediatric tracheal surgery. Ann Thorac Surg 2002. 74:308–314.

Editorial Comment

Tracheal stenosis is a rare, potentially life-threatening condition due to narrowing of the tracheal lumen. Tracheal stenosis may be congenital, due to incomplete tracheal rings, or the result of prolonged intubation or the compression of vascular structures. Historically tracheal stenosis has had a poor prognosis, with high morbidity and mortality. Significant advances in radiographic, cardiac bypass, endoscopic, and surgical techniques have led to better overall survival and reduced morbidity. The most common techniques currently used include endoscopic dilation, tracheal resection, and slide tracheoplasty, which have replaced

the technique of pericardial patch tracheoplasty used previously. Because tracheal stenosis is a complex condition, an individualized treatment plan for each patient must be formulated by a multidisciplinary team.

Review Questions

1. The blood supply of the trachea is predominately located where?

   a. Midline anterior tracheal wall

   b. Intraluminal mucosa

   c. Posterior trachealis

   d. The lateral longitudinal submucous plexus

2. Congenital tracheal stenosis has a 50% to 70% association with

   a. Malformation of the posterior fossa

   b. Web of the anterior glottis

   c. Cardiovascular malformations

   d. Limb malformations

3. The classic appearance for slide tracheoplasty intraluminal restenosis is?

   a. **Figure of eight**

   b. Circumferential

   c. A-frame

   d. Hourglass

4. When symptoms of tracheal stenosis are present, the luminal stenosis is estimated to be at the following, respectively:

   a. 50% stenosis with symptoms at rest, 10% stenosis with symptoms with activity

   b. 10% stenosis with symptoms at rest, 50% stenosis with symptoms

with activity

c. 50% stenosis with symptoms at rest, 75% stenosis with symptoms with activity

d. 75% stenosis with symptoms at rest, 50% stenosis with symptoms with activity

OUTLINE

200. Thyroglossal Duct Cyst

201. Branchial Cleft Cysts and Sinuses

200

Thyroglossal Duct Cyst

Samantha Anne, and Andrew F. Inglis Jr.

Introduction

Thyroglossal duct cysts (TGDCs) are the most common congenital midline cervical anomalies in children and account for approximately 70% of all congenital neck lesions.[1] The differential diagnosis of a midline mass in the neck mass in a child includes TGDC, dermoid, lymph node, lipoma, hemangioma, ranula, and inflammatory lesion. One study that evaluated preoperative computed tomography (CT) and histopathologic findings of excised midline neck lesions found that TGDCs were most common (55% of cases). Other common findings were dermoids in 21%, ranula in 10%, and the remaining were inflammatory lesions.[2]

During embryogenesis, the foramen cecum develops at the floor of the primitive pharynx. The thyroid tissue begins to descend from the foramen cecum anterior to the hyoid bone and laryngeal cartilages to finally reach its normal adult pretracheal position. The proximal portion of the diverticulum that connects the thyroid gland and foramen cecum typically obliterates and atrophies over time. TGDCs are thought to occur due to failure of the thyroglossal duct to obliterate after the thyroid gland completes its descent into the inferior aspect of the neck.[3]

TGDCs tend to present in childhood as a painless midline mass just inferior to the hyoid at the level of the thyrohyoid membrane (65%). Other locations include the suprahyoid location in up to 20% to 25% of the cases and at the level of the hyoid in 15% to 50% of the cases.[4] TGDCs usually occur in equal frequencies in males and females.[5] Because this is a congenital lesion, it would not be surprising for the most common age of presentation to be in childhood. One of the largest reviews of patients with TGDCs revealed that these lesions occur frequently in children with nearly one-third of the cases in children less than 10 years of age.

However, nearly one-third of the cases occurred in patients in their third decade or older. Similarly, recent reports suggest a bimodal incidence with the most common average age in children to be 6 years and in adults to be 41 to 45 years.[5] TGDCs are benign cysts that mainly consist of abundant colloid and are lined predominantly with ciliated columnar epithelium.[6] Carcinoma has been shown to occur rarely in these cysts, with an incidence of 1%.[7]

Key Operative Learning Points

- The most common location for TGDC is in the midline, just inferior to the hyoid bone.
- The Sistrunk procedure, which involves removing the midportion or body of the hyoid bone with the cyst and a core of tongue muscle, is the recommended surgery for TGDC.
- The thyroid notch is used as a landmark to mark the midline of the neck.
- The cricoid cartilage in very small children can be high in the neck and mistaken for the hyoid bone.

Preoperative Period

Surgical excision of a midline mass in the neck is useful for diagnostic and therapeutic purposes. Indications for excision of a midline mass in the neck mass include diagnosis, cosmetic appearance, prior infection, and possibility of malignancy. The recommended surgery for TGDC is a Sistrunk procedure that includes removal of the cyst along with the central portion of the hyoid bone, including a core tissue at the base of the tongue. The Sistrunk procedure has been shown to decrease the rate of recurrence to approximately 5%.

Thorough history taking and a physical examination are essential to diagnosis. The majority of the patients present with the history of a rapidly enlarging midline mass in the neck and oftentimes report a history of a preceding upper respiratory illness. When acutely infected, the mass can be painful, erythematous, and warm to touch. Some may present with recurrent infections that have been previously treated and

improved on antibiotics.[8] Others may have had incision and drainage procedures due to misdiagnosis. Patients may be completely asymptomatic or can have dysphagia, odynophagia, and a feeling of obstruction if severely enlarged.

On examination, cysts usually measure 1 to 2 cm but can be as large as 10 cm. The mass is characteristically described as moving with swallowing or protrusion of the tongue due to its attachment to the hyoid bone. Cysts are usually nontender unless acutely infected. Some patients may have a draining tract from the site of a prior incision and drainage, recurrence due to incomplete excision, or a ruptured cyst.

History and physical examination are the mainstay for diagnosis and therapeutic planning in terms of TGDC. However, a number of studies have been used to aid in diagnosis when not clear and when there is suspicion for extensive disease beyond the appearance of a cyst. These include radionuclide studies, ultrasonography (US), CT, and magnetic resonance imaging (MRI).

Historically, radionuclide studies were used to identify functional thyroid tissues and to eliminate the possibility of mistaking ectopic thyroid gland for TGDC. Excision of ectopic thyroid gland with no functioning thyroid gland elsewhere will result in hypothyroidism. Radionuclide studies are now less used to avoid the unnecessary radiation with minimal diagnostic advantage offered in comparison to US, CT, or MRI.

US is an invaluable initial test for evaluation of TGDC. It avoids the exposure to ionizing radiation from CT scans and possible need for sedation in MRI studies, especially in young children, and is low cost. In addition, it has been shown to have sensitivity and accuracy comparable to CT or MRI19. An uncomplicated TGDC appears as an anechoic, well-circumscribed, thin-walled cyst. At times, the presence of proteinaceous fluid can give a pseudosolid appearance, while prior infection and hemorrhage may give a heterogeneous appearance.[9]

CT and MRI can be useful to delineate the extent of the lesion when it is extensive and help if there is difficulty ascertaining the diagnosis on US. On CT, TGDCs tend to be smooth, well circumscribed, midline, and closely related to the hyoid bone. They tend to be unilocular but can have septations. In the setting of prior infection, there may be a thickened cyst

wall, increased fluid attenuation, and loss of tissue planes. MRI features are usually homogeneous low signal on T1-weighted images and homogeneous high signal on T2-weighted images due to the fluid within the cysts. The duct tract can sometimes be traced on T2-weighted fat saturated images.[9]

If presurgical imaging is attained, suspicion of malignancy should arise if dense or enhancing mural nodules, calcification, or both are seen within the lesion. Calcifications are best seen on CT and are due to psammoma bodies, the histologic hallmark of papillary carcinoma. However, the diagnosis of carcinoma is usually made incidentally on histologic examination of pathology specimens following surgical excision.

History

1. History of present illness
   a. Onset of cyst and relation to upper respiratory illnesses
   b. Symptoms of obstruction (e.g., dysphagia, odynophagia, stridor)
   c. Prior infections in the same locations
2. Past medical history
   a. Prior surgical incision and drainage procedures or excisions of cysts
   b. Prior treatment with antibiotics
3. Medications
   a. Vitamin E, nonsteroidal anti-inflammatory drugs, homeopathic medications
   b. Allergies to antibiotics

Physical Examination

1. Oral cavity and oropharynx; the cyst moves with protrusion of the tongue
2. Neck
   a. Cystic lesion measuring up to 10 cm

b. Can be nontender or tender if acutely infected

c. Prior scarring or fistulous tracts

d. The mass moves up and down with swallowing

Imaging

1. Ultrasound
   a. Anechoic, well-circumscribed, thin-walled cyst
   b. Valuable initial test: Inexpensive and avoids radiation
2. CT
   a. Calcifications raise concern about possible malignancy.
3. MRI
   a. To avoid radiation when further imaging is needed
   b. Can be used to trace duct on T2-weighted fat saturated images

Indications

- Midline mass in the neck
- Recurrent injections
- Failed prior resections or incision and drainage procedures

Contraindications

- Comorbidities make patient unsafe for anesthesia and surgery
- Inadequate social support and support during recovery

Preoperative Preparation

1. Evaluation by
   a. Otolaryngologist
   b. Primary care physician for medical clearance when significant

comorbidities present

2. Discontinue nonsteroidal anti-inflammatory drugs (NSAIDs) and other drugs that increase the chance of bleeding.

Operative Period

Anesthesia

The procedure is typically performed via a general anesthetic. A nasal RAE tube facilitates intraoral manipulations and is desirable.

Positioning

- The patient is positioned supine on a shoulder roll with the neck extended.
- The lower face and neck are sterilized and appropriately draped.

Perioperative Antibiotic Prophylaxis

- The typical recommendations for clean-contaminated head and neck surgery apply to this procedure, since oral contamination may occur.
- Antibiotics are administered during induction of anesthesia and continued for 24 hours.
- Choices
  - Clindamycin
  - Ampicillin-sulbactum
  - Cefazolin and metronidazole

Monitoring

- Routine anesthesia monitoring
- Consider requesting that patient not be paralyzed in order to facilitate monitoring for hypoglossal nerve.

Instruments and Equipment to Have Available

1. Basic soft tissue surgical set

2. Hyoid or other bone-cutting scissors

3. Headlight

4. For recurrences, or TGDCs at high risk for recurrence, use the following:

- Jennings self-retaining oral retractor
- Perforating towel clip
- 3.5-inch 18-Ga spinal needle
- Heavy suture such as #2 (not 2-0) braided polyester
- Tonsil clamp
- Sterile button or 2-cm section of 14-Fr red-rubber catheter

Key Anatomic Landmarks

1. Foramen cecum: Junction of the anterior two-thirds of the tongue with the posterior one-third in the midline

2. Midportion or body of the hyoid bone: A 1- to 2-cm section, depending on patient age/size, of the central portion of the hyoid bone is removed.

3. Thyroid notch in the thyroid cartilage: This landmark can be used to mark the midline of the neck.

4. Cricoid cartilage: In very small children, this may be quite high in the neck and mistaken for the hyoid bone.

Prerequisite Skills

1. Basic soft tissue surgical skills

Operative Risks

1. Recurrence from incomplete resection

- Goal of the surgery: Remove the cyst and any associated ductal remnants and secretory tissue.
- Ductal remnants and secretory tissue are generally scattered and likely difficult or impossible to identify intraoperatively.
- Complete extirpation of these elements is most likely achieved by an en bloc excision with a specimen consisting of the cyst, soft tissues between the cyst and midportion of the hyoid bone, and soft tissue attached to the superior surface of the hyoid connected to a core of tongue muscle extending to the foramen cecum.

2. Intraoperative hemorrhage from the lingual artery

- If the dissection in the tongue base strays from the midline, the lingual artery may be encountered.
- The lingual artery can be avoided by using a traction suture to maintain midline orientation as described later in this chapter or feeling for the midline with a double-gloved finger in the mouth applying downward pressure to the foramen cecum.

3. Postoperative hematoma or infection

- These complications may be mitigated by placing a drain.
- Known regional cases of hematoma leading to catastrophic airway obstruction
- For this reason, the central portion of the wound can be closed loosely over a quarter inch Penrose drain, which is generally removed the following morning, in the hopes that this will lessen the chance of this very rare but potentially devastating complication.

4. Pharyngocutaneous fistula

- May result from a breakdown of the closure of the tongue-base mucosa. These will generally close spontaneously in several days.

Surgical Technique (Fig. 200.1)

- Subcutaneous tissues in a suitable upper-neck skin crease are infiltrated with a bupivacaine/epinephrine solution, and the patient is sterilely

draped.

- If the cyst is not attached to the dermis, a simple horizontal transverse incision is performed straddling the midline of the neck, usually just below the body of the hyoid in a natural skin crease. Dermal attachments or inflammation may require removal of a fusiform section of overlying skin. Dissection is then carried down to the anterior surface of the cyst.
- If the cyst appears to have mucoid or purulent material within, a modified Sistrunk procedure is performed as described later in the chapter. If there has been no prior history of infection and the cyst appears filled with whitish or cream-colored contents, it is likely a dermoid and a simple excision can be performed. If after removal it is confirmed that the cyst contents consist of thick cheesy material, the wound can be closed.
- Upon deciding to perform a modified Sistrunk procedure, the cyst is then partially freed via dissection around its anterior, inferior, lateral, and posterior surfaces, but soft tissue attachments between the cyst and the hyoid bone are left intact, as these may contain microscopic ductal and secretory elements. The cyst is elevated and a plane is developed posterior to the body of the hyoid bone.
- Dissection then proceeds in a layer just superficial to the anterior face of the body of the hyoid bone along the midline, and the hyoid is divided on either side of the midline such that a 1- to 1.5-cm central segment is freed up. The hyoid bone can be cut with a needle-tipped cautery in small children and bone cutter or hyoid scissors in larger patients. Soft tissue attachments to the superior aspect of the hyoid bone are left undisturbed.
- The suprahyoid portion of the procedure is then performed. To accomplish this, the now free-floating section of hyoid bone is grasped with an Allis or Leahy clamp and pulled anteroinferiorly, and a cylinder of tissue at the base of the tongue is created through a superiorly aimed dissection with an insulated needle-tipped cautery. In general, we recommend a more aggressive tongue base excision when there is a history of prior infection, as these are more likely to recur.
- If the pharynx is entered, it is readily closed with a row of simple

interrupted sutures. Exposure can be facilitated by using the first suture placed as a traction suture and cutting it after later sutures have been placed. The remainder of the wound is then closed in layers according to the surgeon's preference.

Modification of Surgical Technique: Traction Suture and Transhyoid Pharyngotomy

- Placing a traction suture to guide the tongue-base resection, improve exposure, and facilitate the safe resection of a more generous portion of the tongue base may be helpful in the following circumstances[8]:
  - Situations where the risk of recurrence is high, such as patients who have had previously operated TGDCs or primary surgery on TGDCs that have had previous infection
  - Large patients with a "bull neck"
- The suture is placed prior to the sterile neck prep and after the patient is positioned. The patient's mouth is kept opened with a Jennings mouthgag. The tongue is grasped with a perforating towel clip, and an assistant pulls the tongue anteriorly. The surgeon places a long 18-Ga spinal needle through the skin overlying the body of the hyoid bone and advances the tip through the tongue mucosa at the foramen cecum. The stylet is removed and a #2 braided polyester suture is advanced through the needle, the end is grasped in the mouth with a tonsil clamp, and the needle is withdrawn. A "stopper" consisting of either a sterile button or a short section of 14-Fr catheter is tied to the intraoral section of the suture with a long tail of suture brought out through the mouth and tagged with a clamp (Fig. 200.2). The neck is then prepped and draped in the usual sterile fashion.
- Intraoperatively, the suture is identified, pulled through the skin into the wound, and is pulled anteroinferiorly during the tongue base resection, while a core of tongue tissue is developed around it. This traction on the tongue base serves as both a guide to the resection, keeping it in the midline, and also delivers the upper part of the tongue base into the wound, greatly improving exposure of the upper part of the resection (Fig. 200.3).

- When operating on recurrent TGDCs, dissection includes a cylinder of tongue tissue, including the tongue mucosa (Fig. 200.4). The traction suture is divided and the intraoral section removed by the anesthesiologist. The pharyngotomy is carefully closed in layers with interrupted absorbable suture over a Penrose drain. Further details of the procedure are described by Perkins et al.[8]
- Alternatively, a curved retractor may be placed through the mouth with the tip in the vallecula. Pressure on the retractor brings the base of the tongue into the wound, facilitating the excision of the block of tissue at the foramen cecum.

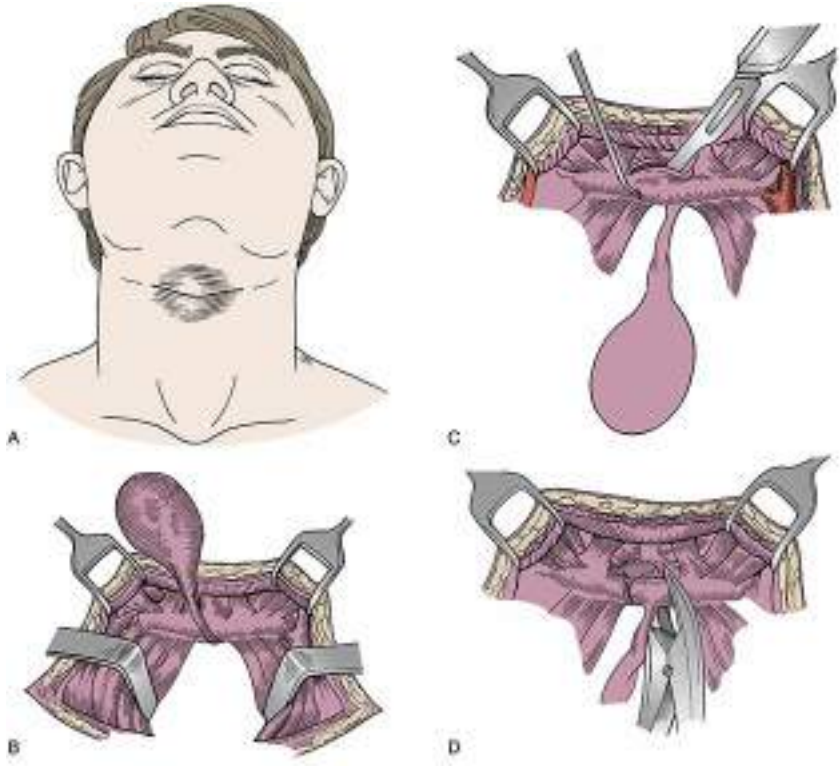

FIG. 200.1 **A,** The incision is placed in the major skin crease in the midline of the neck. **B,** The cyst is identified, the strap muscles are retracted, and the cyst is pedicled on the hyoid bone. **C,** The hyoid bone is grasped with a tenaculum and skeletonized. **D,** The hyoid bone is transected with a bone cutter.

Common Errors in Technique

1. The vallecula is entered posterior to the hyoid bone: Only a thin layer of tissue may separate the mucosa from the posterior surface of the hyoid.

2. The dissection may stray from the midline: Landmarks need to be checked frequently.

3. Too little tongue tissue may be removed:

- Surgeons have reported low recurrence rates with removal of only a very limited cuff of tissue above the body of the hyoid.
- Most surgeons suggest the ideal resection includes a core of tongue tissue of approximately 1 cm in diameter extended to the foramen cecum and either ending the dissection just shy of the mucosa superiorly or including a small disc of mucosa with the excision.

4. The superior skin flap may be injured or "button-holed" during the dissection. Vigilance is necessary, and an adequate incision must be made.

5. The incision heals with excessive dimpling in the midline. The strap muscles must be brought together medially to help fill the dead space created by the loss of the midportion of the hyoid bone and the superficial soft tissues.

Postoperative Period

Postoperative Management

1. Routine pain management with acetaminophen, ibuprofen, and oxycodone may be started immediately.

2. Patients may prefer a soft diet for a few days.

3. A drain, if placed, may be removed the following morning.

4. Select patients may be discharged on the day of surgery.

Complications

1. Hemorrhage: The wound should be opened and re-explored.

Catastrophic airway obstruction at the tongue base is a possibility.

2. Infection: Mild infections may be managed with oral antibiotics. More severe infections typically require reopening the wound for drainage.

3. Salivary fistula: These usually close spontaneously within several days in patients who do not have any medical conditions that may inhibit wound healing. Oral antibiotics will usually suffice in suppressing infection.

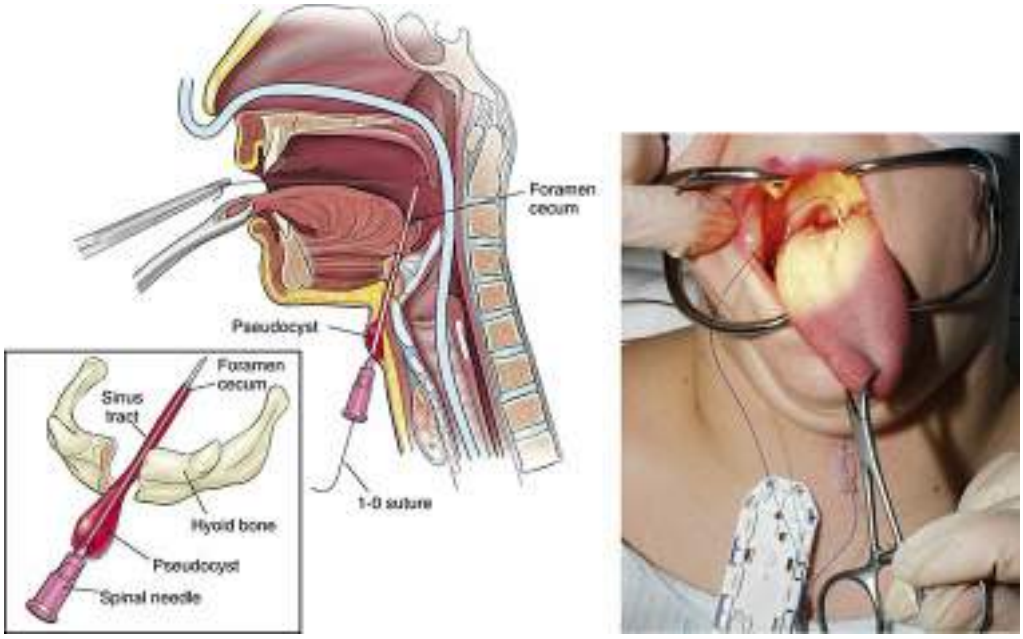

FIG. 200.2 Placement of a traction suture to guide the tongue-base resection through the foramen cecum.

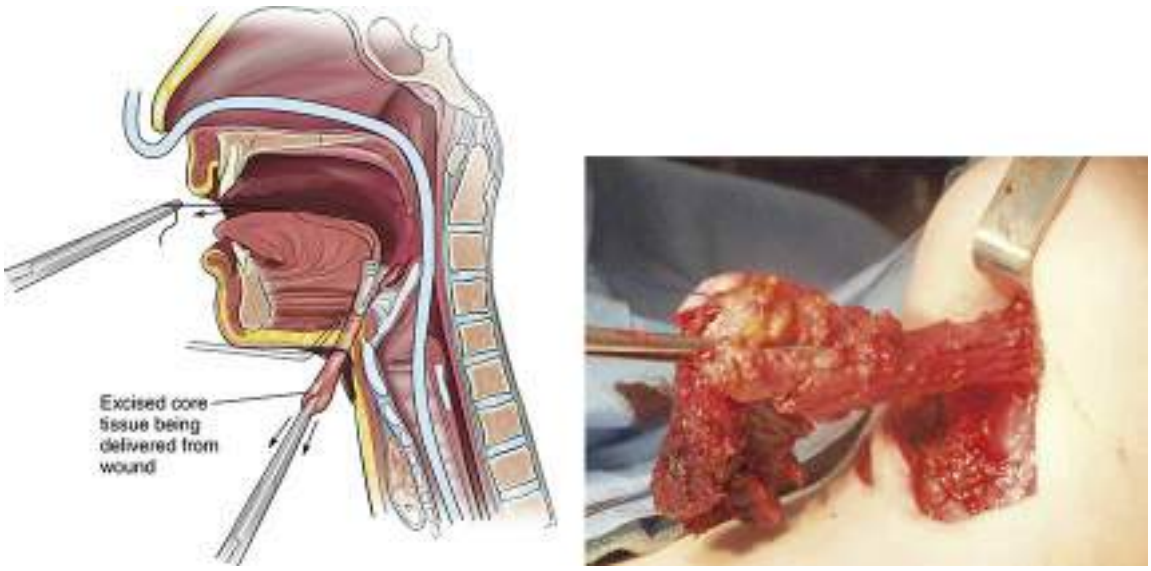

FIG. 200.3 Use of a traction suture to deliver the upper part of the tongue base into the wound to improve exposure of the upper part of the resection.

FIG. 200.4 For recurrent TGDCs, dissection includes a cuff of tongue tissue including the tongue mucosa; the pharyngotomy is carefully closed in layers.

4. Recurrence: Incomplete excision of secretory material, almost invariably situated in the tongue base if the hyoid has been previously

resected, may produce a pseudocyst located virtually anywhere in the anterior neck. Most become apparent within a few months of the original procedure. Treatment requires re-excision via a technique such as the suture-guided transhyoid pharyngotomy or other approach to the tongue base.

Alternative Management Plan

Sclerotherapy: Some success has been reported with percutaneous ethanol sclerotherapy of TGDCs, and this may be a consideration for patients who are poor surgical candidates.

Discussion

Evidence-Based Medicine Question

TGDCs are the most common congenital midline cervical anomalies in children. Primary surgical excision using the Sistrunk procedure is the recommended management. This entails an en bloc excision of the cyst and its tract to the foramen cecum, including the midportion of the hyoid bone with cuff of tissue from the base of the tongue in the specimen. When untreated, recurrent infections, fistulas to skin, and signs of obstruction from increasing size of the lesion can occur. The Sistrunk procedure is a relatively safe procedure with low complications and risks, and when done properly, this has a very low recurrence risk for the cyst. The procedure is also adequate treatment for incidentally discovered thyroid cancer in the TGDC.

Editorial Comment

What other options exist for TGDC and what are the risks and benefits?

A number of small series have reported some success with percutaneous sclerotherapy of TGDCs. However, there are risks associated such as inflammation, hematoma, fever, or hypersensitivity. In addition, the subsequent excision of lesion, if there is recurrence, can become more difficult due to leaked sclerotic agents that can cause tissue inflammation and scarring. A transoral approach, endoscopically

assisted, has been reported recently with the benefit of not producing an external scar. However, no long-term results and subsequent reports are available.

Review Questions

1. Which of the following structures does not need to be removed as part of the Sistrunk procedure?

   a. Cuff of tissue at base of tongue

   b. Mid-section of hyoid

   c. Adherent dermis in an infected cyst

   d. **Lesser horn of the hyoid**

2. Which of the following does not increase the chance of recurrence of a cyst?

   a. History of prior surgical excision

   b. History of prior infection

   c. Incomplete removal of the cuff of tissue at base of tongue

   d. **Removal of 1 to 2 cm of mid-hyoid bone as part of resection of specimen**

3. Which is not an advantage of using ultrasound as an initial test for TGDC?

   a. Doesn't require anesthesia usually

   b. Avoids radiation

   c. **Shows clear delineation of extent of lesion and markers of malignancy**

   d. Inexpensive

Branchial Cleft Cysts and Sinuses

Steven Hamilton, and Michael Cunningham

Introduction

Anomalies of branchial derivation should always be considered in the differential diagnosis of a mass in the neck, particularly in children but also in adults. Such anomalies are second only to thyroglossal duct cysts as the most common masses of congenital origin and are the most common congenital masses presenting in the lateral neck.[1] Depending on the branchial cleft or pouch of origin, these anomalies can manifest anywhere from the auricular region to the supraclavicular fossa. They are most commonly located in the anterior neck, lateral to the midline and medial to the sternocleidomastoid (SCM) muscle. A branchial anomaly can present as a cyst, sinus, or fistula. The differential diagnosis of branchial cysts includes dermoid cysts and lymphatic vascular malformations. Infected branchial cysts can mimic suppurative cervical lymphadenitis. Cystic malignant metastases must be ruled out in adults. The physical presence of a cutaneous sinus or fistula tract strengthens this diagnosis.

The surgical management of these anomalies varies depending on the cleft or pouch of origin and whether the anomaly is a cyst, sinus, or fistula. A detailed knowledge of the embryology of these lesions is therefore necessary for both definitive diagnosis and proper therapeutic intervention.

Key Learning Points

- A branchial anomaly may present as a cyst, sinus tract, or fistula tract.
- The anatomic location of the cyst, sinus, or fistula reflects the branchial system of origin.

- A variety of imaging studies—ultrasonography, computed tomography (CT), magnetic resonance imaging (MRI), and contrast swallow studies—can enhance diagnostic accuracy and surgical management.
- In adults, the possibility of a malignant metastasis with cystic degeneration should be ruled out before an anterolateral neck cyst is excised.
- Incision and drainage of infected branchial cysts should be avoided if possible; needle aspiration is preferred to avoid disrupting the cyst.
- Complete surgical excision is the definitive therapy for most branchial anomalies.
- Operative direct laryngoscopy should be performed prior to the excision of an inferior anterolateral neck mass of suspected third or fourth branchial origin to rule out the possibility of an internal sinus tract communicating with the pyriform sinus.
- The risk of postoperative recurrence of all branchial anomalies increases if there has been previous infection or unsuccessful surgical intervention.

Preoperative Period

Preoperative Assessment

The proper surgical management of branchial anomalies requires detailed knowledge of the embryology and anatomy associated with this system.

Many of the symmetrically paired structures of the head and neck arise from the branchial system, which appears during the fourth to seventh weeks of fetal development as six ridges on the superolateral surface of the head. These ridges are known as branchial arches owing to their resemblance to the gill arches of fish. Each arch represents a condensation of mesoderm, from which cartilage, muscle, and bone will form. The arches are separated from one another by an external cleft of ectodermal origin and an internal pouch of endodermal origin. As fetal maturation proceeds, most of the external clefts and internal pouches

resorb and the arches fuse. Anomalies of the branchial system can form from any aberration in this process including failure of the external clefts and internal pouches to recede. Anomalies of the branchial system present in any of three distinct forms: sinus tracts, fistula tracts, and cysts. A sinus tract opens into either the pharynx or the skin and ends blindly in the neck; it is representative of a vestigial pouch or cleft. A fistula tract has both cutaneous and pharyngeal communications and is thought to arise from a persistence of both cleft and pouch with dissolution of the dividing plate. A branchial cyst is essentially a residual pouch or cleft with no external or internal communication. The anatomic location of the cyst, sinus, or fistula reflects the branchial system of origin, designated by the superior of the two arches (first, second, third, or fourth) separated by the cleft and pouch (Fig. 201.1).

Branchial anomalies most commonly arise from the second (65% to 90%) and first (8% to 25%) branchial systems; anomalies of the third and fourth systems are comparatively rare.[2] Third and fourth branchial anomalies have a left-sided predominance; second branchial anomalies tend to occur more often on the right.[3] Although these lesions can manifest at any age, the average age of presentation is less than 5 years, and no gender predilection is apparent. Branchial cleft anomalies with cutaneous sinus or fistula tracts are typically apparent at birth; cysts and branchial pouch anomalies with pharyngeal communications tend to present later in life. Within the adult population, the mean age of diagnosis of branchial cysts has been reported as 40 years, with a slight female predominance.

First Branchial Anomalies

First branchial cleft anomalies are often divided into two subgroups or types. The historic Work classification system is based on histopathology.[4] Work type I anomalies consist of only ectodermal (squamous epithelium) elements representative of exclusively cleft remnants. Work type II anomalies consist of both ectodermal (squamous epithelium) and mesodermal (cartilage) elements reflective of both cleft and arch remnants.

Subsequent anatomic classifications have greater surgical relevance. Type I anatomic anomalies manifest as a sinus tract and/or cyst (Fig.

201.2A). If there is a cutaneous opening, it is located anterior, inferior, or (rarely) posterior to the auricle above the level of the mandible. The sinus tract or cyst in type I anomalies is superficial to the parotid gland and facial nerve; the tract typically parallels but does not communicate with the external auditory canal, ending blindly.

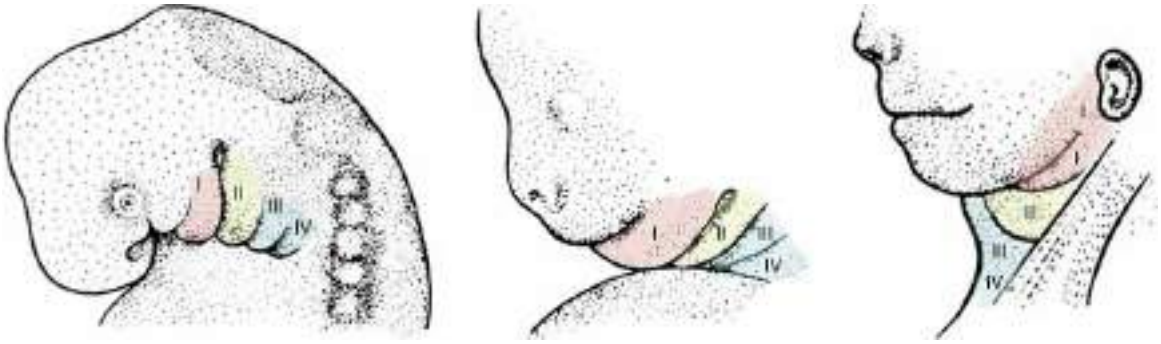

FIG. 201.1 Schematic diagram of the developing branchial system. I - First branchial apparatus, II - Second branchial apparatus, III - Third branchial apparatus and IV - Fourth branchial apparatus.

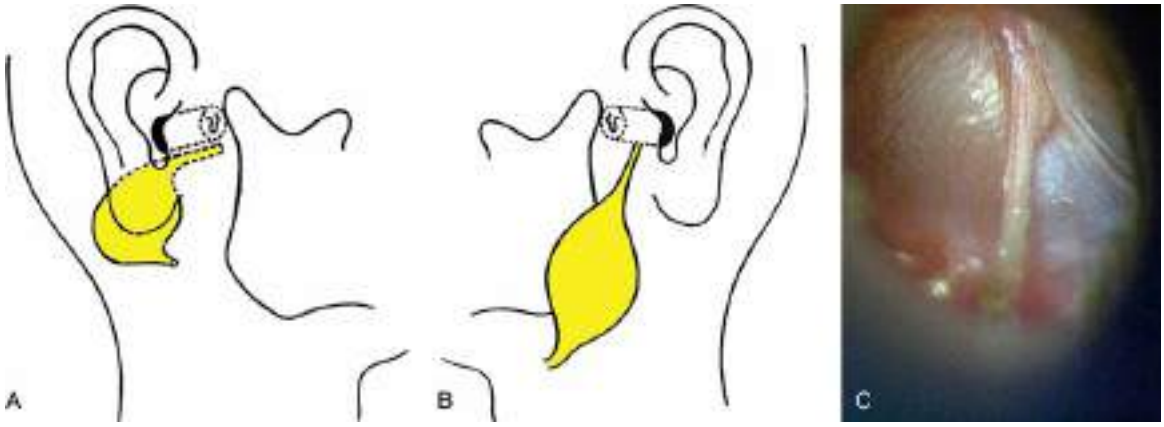

FIG. 201.2 **A,** Type I first branchial anomaly. **B,** Type II first branchial anomaly. **C,** Extension of a type II first branchial anomaly to the tympanic membrane.

A type II anatomic anomaly may present as a sinus tract, fistula tract, or cyst (see Fig. 201.2B). The cutaneous cervicofacial opening, if present, is typically at or below the angle of the mandible and always superior to the level of the hyoid. The course of the sinus or fistula tract or location of

the cyst is highly variable with respect to the parotid gland and facial nerve. Tracts may be superficial or deep to the main branches of the facial nerve and may even course between specific branches. Type II fistula tracts of the first branchial cleft communicate directly with the ipsilateral external ear canal and may even extend to the tympanic membrane (see Fig. 201.2C).

Second Branchial Anomalies

A second branchial anomaly may present as a cyst, sinus tract, or fistula tract. Isolated branchial cysts most commonly originate from the second branchial system. On histopathologic examination, lymphoid tissue is characteristically found within the cyst walls. The external opening of a second branchial cleft remnant, if present, is typically found at the anterior border of the SCM muscle, always inferior to the level of the hyoid bone and superior to the level of the cricothyroid cartilages. The course of a complete second branchial fistula tract would run superior and lateral to both the glossopharyngeal and hypoglossal nerves and then between the internal and external carotid arteries, opening internally into the ipsilateral tonsillar fossa (Fig. 201.3A).

Third Branchial Anomalies

Anomalies of the third branchial system are most often sinus tracts or cysts; the occurrence of a true fistula is very rare. The pharyngeal opening of a third branchial pouch remnant, is within the base of the ipsilateral pyriform sinus. An internal sinus tract runs transversely from the thyrohyoid membrane into the neck, then traveling inferior and posterior to the glossopharyngeal nerve and superior to the hypoglossal nerve and finally coursing posterior to the internal carotid artery. The cutaneous opening of a third branchial cleft remnant is typically in the anteroinferior neck at the anterior border of the SCM (see Fig. 201.3B). A third branchial cyst may occur anywhere along this theoretical course. Because of the pharyngeal pouch component of a third branchial anomaly, thymic tissue may be present within the cyst walls; some consider cysts of the third branchial pouch to be synonymous with thymic (thymopharyngeal) cysts.

Fourth Branchial Anomalies

Fourth branchial anomalies likewise manifest solely as sinus tracts or cysts. A complete fistula tract would be highly unlikely given its predicted long tortuous course (see Fig. 201.3C). Similar to third branchial anomalies, the cutaneous opening of a fourth branchial cleft remnant, if present, is in the anteroinferior neck at the anterior border of the SCM. In contrast to third branchial anomalies, the internal opening of a fourth branchial pouch remnant should be at the apex, not base, of the ipsilateral pyriform sinus. An internal sinus tract arising from the apex of the pyriform sinus would pierce the cricothyroid membrane to enter the neck, theoretically coursing inferiorly and deep to the superior laryngeal nerve and superficial to the recurrent laryngeal nerve. This course would bring the tract into close proximity to the superior pole of the ipsilateral thyroid gland.

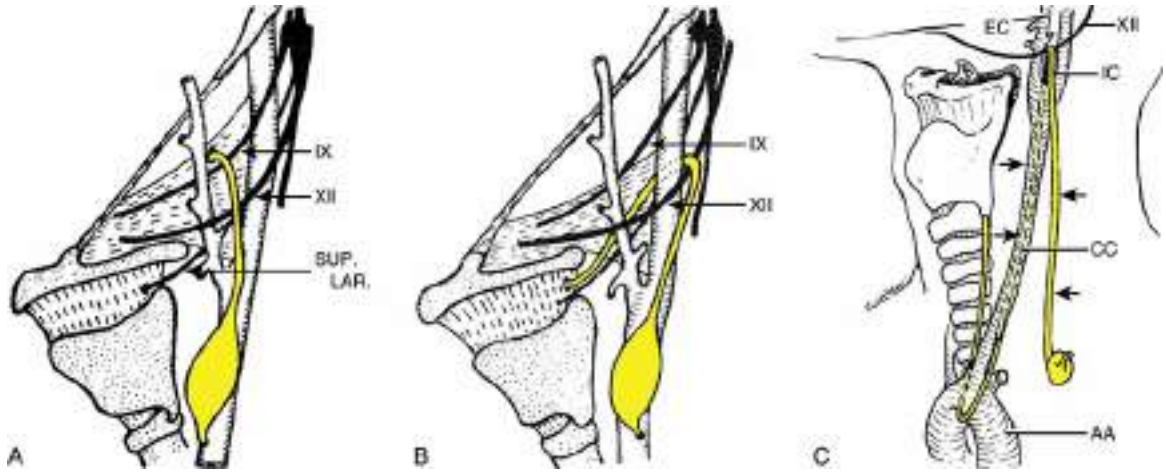

FIG. 201.3 **A,** Second branchial anomaly. **B,** Third branchial anomaly. **C,** Fourth branchial anomaly. IX - Glossopharyngeal Nerve, XII - Hypopharyngeal Nerve, Sup. Lar. - Superior Laryngeal Nerve, EC - External Carotid Artery, IC - Internal Carotid Artery, CC - Common Carotid Artery.

Given the anatomic course of third and especially fourth branchial anomalies, abscess formation or recurrent infection of the thyroid gland should raise suspicion of a third or more likely fourth branchial pouch

remnant. An internal communication to the ipsilateral pyriform sinus must be ruled out in such cases.

Clinical History

1. Presenting history
    a. When and how did the anomaly first present (cervicofacial cutaneous opening, evident neck mass, or both)?
    b. Has there been any evidence of secondary infection such as fluctuation in size, pain, or erythema of the overlying skin? (This could be due to an internal pharyngeal communication or the activation of lymphoid aggregates in the cyst wall secondary to an upper respiratory tract infection.)
    c. If a cervicofacial cutaneous opening is present, has there been drainage? (This would most likely be due to glandular secretions from the lining of the sinus tract but could also reflect saliva if there were a true fistula with a pharyngeal communication.)
    d. Has there been any evidence of compromise to the aerodigestive tract, such as dysphagia or stridor?
2. Past medical/surgical history
    a. Confirmed previous infection?
    b. Previous surgical intervention such as needle aspiration or incision and drainage?
3. Family history
    a. Similar presentation?
    b. Syndromic background?
    c. Bleeding disorders or adverse reactions to general anesthesia (in preparation for surgical excision)?
4. Medications
    a. Particularly any medications that would complicate anesthesia or increase the risk of hemorrhage
5. Social history

a. A history of alcohol and/or tobacco use is of significance in adults owing to the possibility of cystic cervical neoplastic metastases.

Physical Examination

- Complete examination of the head and neck with a focus on the anatomic location and size of the neck mass as well as the presence of any ipsilateral or bilateral cervicofacial cutaneous openings. A detailed examination of the ear is particularly important if there are any periauricular sinus tract openings.
- A flexible endoscopic laryngopharyngeal examination is necessary in adults to look for a primary malignancy; such an examination, unfortunately, would not be an adequate means of establishing the presence or absence of a tract in the pyriform sinus.
- Evaluation for other craniofacial and systemic physical examination findings suggestive of an underlying syndrome
  - Branchio-oto-renal (BOR) syndrome: Hearing loss, preauricular appendages or tags, malformations of the pinna, stenosis/atresia of the external auditory canal, mild to severe renal impairment
  - Oculo-auriculo-vertebral (Goldenhar, hemifacial microsomia) spectrum: Facial asymmetry, malformations of the pinna and external ear canal, preauricular tags or pits, conductive hearing loss, aplasia or hypoplasia of the mandibular condyle, ophthalmologic abnormalities
  - DiGeorge syndrome: Complete or partial absence of the thymus gland; micrognathia; small low-set ears; blunting, clefting, or indentation of the nose; hypertelorism; cardiac anomalies; cleft palate; hypocalcemia/hypoparathyroidism
  - Treacher Collins (mandibulofacial dysostoses) syndrome: Downward-sloping palpebral fissures, depressed cheek bones, malformed pinna, Pierre Robin sequence, malformations of the external and middle ear, short neck
- Fine-needle aspiration of a cystic mass in the neck in adults is recommended to rule out the possibility of a cervical metastasis.

Imaging Studies

- Ultrasonography is useful as an initial imaging modality, particularly in children, because it is easily obtained and avoids radiation exposure. The ultrasonographic characteristics of a branchial cyst include uniform low echogenicity and lack of internal septation with no acoustic enhancement. Ultrasound can distinguish solid from cystic masses and facilitate fine-needle aspiration if indicated. Three-dimensional ultrasonography has been used to diagnose large branchial cysts prenatally.[5]
- High-resolution CT with contrast is the most widely used imaging modality for a mass in the neck owing to its relative ease of use and clear demarcation of the size, depth, and location with respect to surrounding anatomic structures. A branchial cyst typically appears as a well-defined nonenhancing mass. Sinus and fistula tracts are typically visible on CT only if there is distention of the tract secondary to associated infection or inflammation. If an external cutaneous opening is present, a contrast CT fistulogram may be performed to outline the tract. The main drawback of CT is the associated radiation exposure and potential need for sedation in children.
- MRI with gadolinium contrast is an alternative to CT because of the lack of radiation exposure and excellent soft tissue detail. It is especially helpful with respect to lesions in the parotid gland region to help define the relationship of the mass to the facial nerve. A branchial cyst typically is hypointense on T1 imaging, hyperintense on T2 imaging, and does not enhance with gadolinium. Disadvantages include the comparatively high expense, study duration, and frequent need for sedation and possibly general anesthesia in children.
- A contrast swallow study may be useful in the evaluation of patients with recurrent neck abscesses or suppurative thyroiditis. Such studies should be performed after the acute inflammation has resolved. An internal tract arising in the pyriform sinus should be sought (Fig. 201.4C).

Surgical Indications

- Previous mass in the neck, infection, or draining cutaneous tract
- A symptomatic mass in the neck
- Progressive enlargement of a mass
- Cosmetic deformity
- Diagnostic confirmation

Contraindications

- Patient not fit for general anesthesia

Relative Contraindications

- The excision of an acutely infected branchial anomaly should be avoided if possible owing to increased postoperative morbidity and the risk of recurrence.
- In a healthy infant with a nondraining cutaneous sinus or fistula tract, surgical excision may be delayed for a few years to allow for a larger operative field and decreased risk of injury to surrounding structures. Such a delay also avoids the use of general anesthesia in an infant, given recent concerns of potential adverse effects on the child's subsequent neurologic development.[6] Any other comorbid condition that would preclude surgery under normal circumstances would also constitute a relative contraindication.

Preoperative Preparation

- Suspected infection of a branchial anomaly should ideally be managed before an attempt at definitive resection of the lesion. Systemic oral or parenteral antibiotic therapy is necessary.
- Needle aspiration may enhance medical management and provide a sample of infected material for culture-driven antimicrobial therapy.
- Incision and drainage of infected branchial cysts occasionally proves necessary. If at all possible, this should be avoided so as to prevent disruption of the cyst wall and formation of fibrosis with a view to

future excision.

Operative Period

Anesthesia

- General anesthesia is typically necessary.
- Neuromuscular blockade is contraindicated to allow for intraoperative neural monitoring, particularly in type II first branchial anomalies (facial nerve monitoring) and third and fourth branchial pouch anomalies (recurrent laryngeal nerve monitoring).
- A local anesthetic with epinephrine is often additionally used on the skin for hemostasis.

Positioning

- Positioning may depend on the specific location of the lesion. Patients are typically supine, and a shoulder roll and rotation of the head are often used to enhance exposure.

Perioperative Antibiotic Prophylaxis

- Antibiotics should be administered per standard head and neck procedural prophylaxis protocol. Antimicrobial coverage may have to be broadened in the event of a recent or concurrent infection.
- Postoperative antibiotics may be indicated for intraoperative evidence of infection or the need for postoperative wound drainage.

Instruments and Equipment to Have Available

- Standard head and neck surgical set
- Monopolar and bipolar electrocautery
- Laryngoscopes and telescopes for direct laryngoscopy and

pharyngoscopy

- Lacrimal probes, catheters, and blunt needles for possible methylene blue injection to help define a sinus or fistula tract
- Electrophysiologic neural monitoring capability

Key Anatomic Landmarks

- See the sections titled "Preoperative Period" and "Surgical Technique."

Prerequisite Skills

- Surgical competence with respect to parotidectomy, thyroidectomy, and neck dissection procedures

Operative Risks

- The patient and/or guardians should give consent regarding intraoperative risks to adjacent anatomic structures (particularly facial nerve injury with first branchial anomalies and recurrent laryngeal nerve injury with third and fourth branchial anomalies), immediate postoperative risks (infection and hematoma or seroma formation), and longer-term postoperative risks (scar formation and recidivism/recurrence).

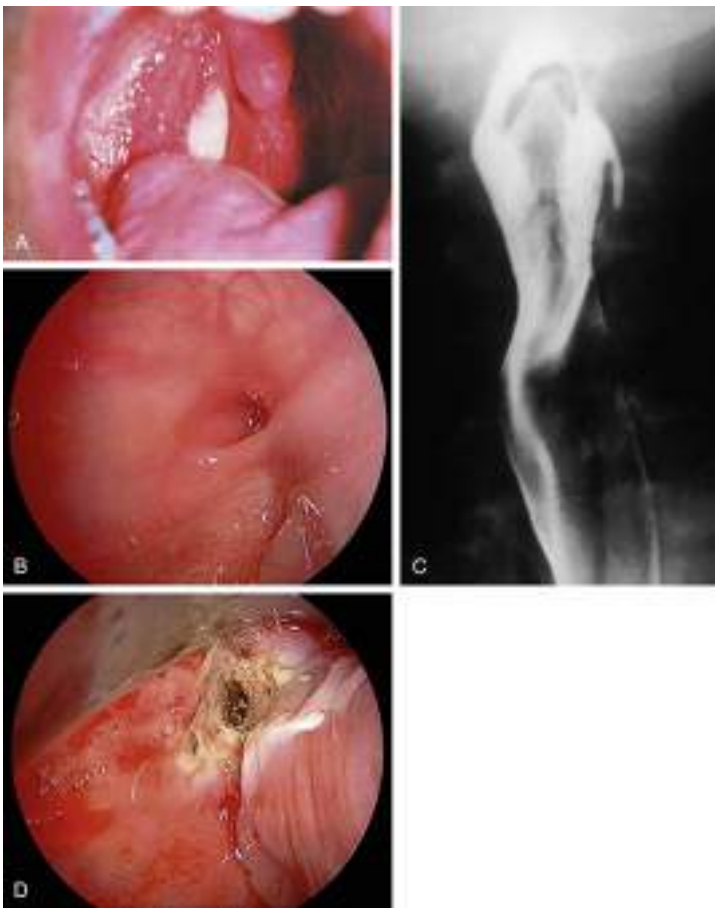

FIG. 201.4 **A,** Sinus opening within the tonsillar fossa. **B,** Sinus opening at the apex of the pyriform sinus. **C,** Contrast swallow study revealing a communication from the left pyriform sinus into the neck. **D,** Cauterization of pyriform sinus opening.

Surgical Technique

1. First branchial anomalies

   a. The goal of surgery for type I first branchial anomalies is complete excision of the sinus tract and/or cyst. The sinus tract may be defined with a lacrimal probe or injection of methylene blue. This is ideally completed prior to the administration of local anesthetic. An elliptical incision is outlined around the tract. If possible, this may be oriented within the auricular crease. If the site is too distant from the auricle to do so, an ellipse around the sinus opening and a separate incision within the auricular crease may be necessary (Fig. 201.5A and B). Since type I lesions are always superficial to the parotid

gland, the parotid and temporalis fasciae serve as ideal landmarks with respect to the depth of excision. Superficial to these tissue planes, a cuff of soft tissue surrounding the sinus tract and cyst can be excised in a circumferential fashion toward the external ear canal. Care is taken to make sure that no violation of the tract or cyst takes place. A shave excision of tragal or external ear canal perichondrium and cartilage is typically necessary at the termination site of the tract. The wound is irrigated and the incision closed in layered fashion. Placement of a drain is infrequently required.

b. The goal of surgery for type II first branchial anomalies is complete excision of the sinus/fistula tract and cyst. In contrast to type I anomalies, type II anomalies require a superficial parotidectomy approach for identification and preservation of the facial nerve; this is facilitated by intraoperative facial nerve monitoring. An elliptical incision is made around the cutaneous cervicofacial opening, as is a standard S-shaped parotidectomy incision within the preauricular crease extending inferiorly over the mandible (see Fig. 201.5C and D). The procedure is carried out concurrently on two fronts. The tract, potentially demarcated as described for type I lesions, is carefully dissected with a surrounding cuff of skin and soft tissue toward the parotid gland. The superficial parotidectomy allows initial identification of the facial nerve trunk and subsequent clarification of the course of the tract relative to the branches of the facial nerve. This approach also clearly demarcates the external auditory canal, into which a type II fistula tract will penetrate. A portion of the cartilaginous canal may have to be excised to remove the tract completely. The wound is irrigated and the incision closed in a layered fashion, typically over a small suction drain.

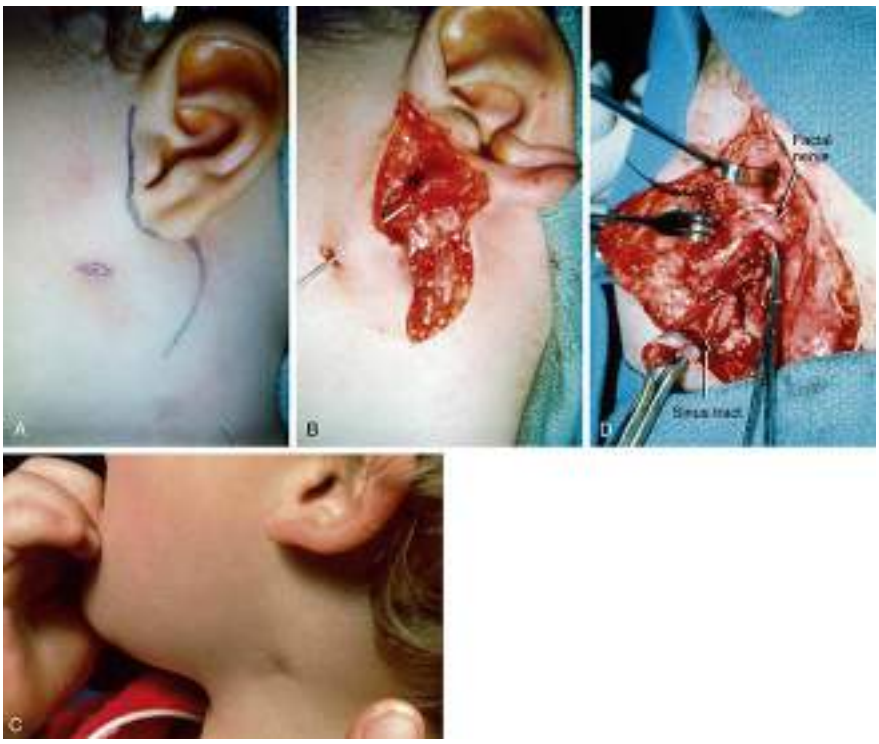

FIG. 201.5 **A,** Preauricular pit with planned excision of type I first branchial anomaly. **B,** Lacrimal probe following course of type I sinus tract. **C,** Skin defect associated with type II first branchial anomaly. **D,** Excision of type II first branchial anomaly with identification of the facial nerve.

2. Second branchial anomalies

   a. A cyst of suspected second branchial origin is managed similar to any isolated mass in the neck. An incision is placed in a skin crease either overlying or just inferior to the mass. If there is a scar from a previous incision and drainage site, this is incorporated into the incision. Subplatysmal flaps are elevated, and the anterior border of the SCM muscle is identified and retracted. The cystic mass, once clearly defined, is dissected in circumferential fashion, care being taken to avoid disruption of the cyst. A large mass may benefit from decompression using needle aspiration to facilitate atraumatic removal. Once the mass has been removed, the wound is irrigated and the incision closed in a layered fashion, typically over a small suction drain.

   b. For sinus or fistula tracts of suspected second branchial cleft origin

with a cutaneous opening, an elliptical incision is outlined around the site of the sinus/fistula. The tract can be further defined with a lacrimal probe, a flexible catheter, or methylene blue injection if desired. A cuff of connective tissue surrounding the tract is excised in order to be certain that all epithelial components have been removed. The anterior border of the SCM muscle is identified and retracted, and the tract is traced both medially and superiorly. A second parallel "stepladder" incision may have to be made cephalad to the first incision to facilitate the removal of long tracts; this allows for the avoidance of disfiguring vertical scars (Fig. 201.6). The majority of second branchial cleft remnants are sinus tracts that end blindly. However, a true fistula tract extending to the pharynx at the level of the tonsillar fossa is possible (see Fig. 201.4A). An ipsilateral tonsillectomy is sometimes necessary in such cases to allow for adequate access to the pharyngeal communication so that it can be closed.

FIG. 201.6 "Stepladder" incision used to remove a long fistula or sinus tract.

3. Third and fourth branchial anomalies

   a. Sinus tracts of third and fourth branchial cleft origin are typically short tracts that end blindly at the border of the SCM muscle or just deep to it. They are managed in identical fashion to second branchial cleft anomalies, with the important proviso of preparation for the possibility of longer, deeper tracts following the embryologic

anatomy described earlier in this chapter.

b. Third and fourth branchial pouch anomalies pose a much more significant operative challenge. Historically these lesions have been approached via a lateral-to-midline curvilinear incision designed to allow adequate exposure of the ipsilateral aspect of the laryngotracheal airway. Both the thyrohyoid (third pouch) and cricothyroid (fourth pouch) membranes need to be identified to determine the origin of the branchial pouch tract. An ipsilateral thyroid lobectomy may be necessary to identify the tract, especially if there has been previous inflammation with subsequent scarring. A thyroid lobectomy in such circumstances also facilitates identification of the recurrent laryngeal nerve. Intraoperative monitoring of the recurrent laryngeal nerve additionally enhances the likelihood of preserving neural function.[7]

c. Concurrent with the external approach already described, direct laryngoscopy and pharyngoscopy is highly recommended to identify a suspected pyriform sinus communication (see Fig. 201.4B). The location of this opening at either the base or apex of the pyriform sinus can guide the external exploration, as can the passage of a catheter into the sinus tract.

d. Solely endoscopic management of identified pyriform sinus tract openings is an initial alternative to transcervical resection. Electrocauterization with a Bugbee diathermy electrode or chemical cauterization with sliver nitrate or trichloroacetic acid (TCA) has been used to scarify the opening of the pyriform sinus, ideally eliminating the pharyngeal communication and egress of bacteria-laden secretions into the neck (see Fig. 201.4D). Cure rates of 78% and 75% have been reported with electrocauterization and TCA cauterization respectively.[8,9]

e. Third and fourth branchial pouch anomalies refractory to such endoscopic and external approaches can be managed via a hypopharyngeal pharyngoplasty, which entails stapling of the pyriform sinus defect (Fig. 201.7).[10] This technique may even be considered the first alternative if endoscopic management fails.

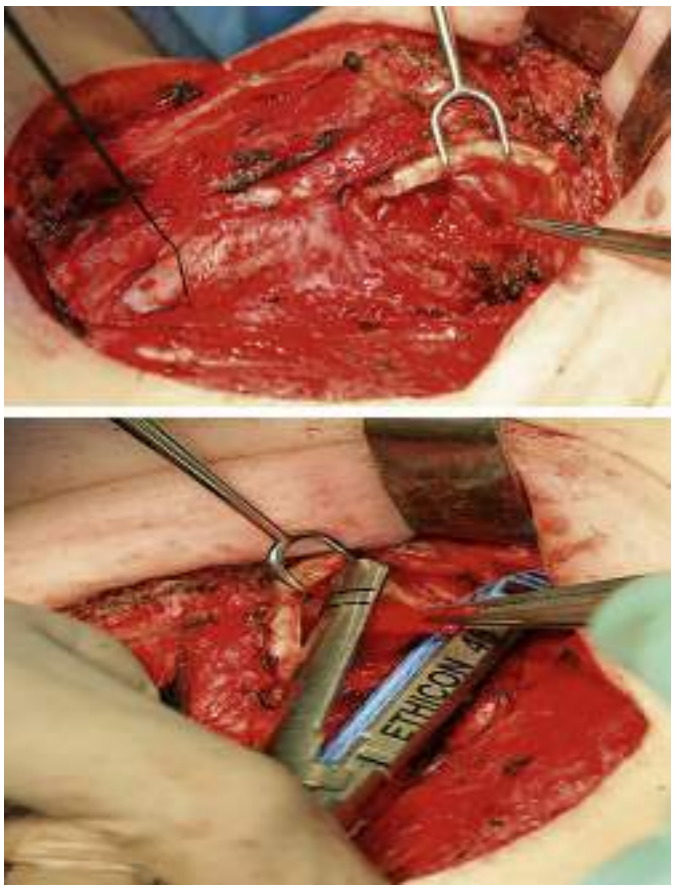

FIG. 201.7 Hypopharyngeal pharyngoplasty technique; the pyriform sinus defect is first identified and then stapled.

Common Errors in Technique

- See the section titled "Complications."

Postoperative Period

Postoperative Management

- Postoperative admission is necessary for those cases requiring drain placement.
- Standard postoperative management of neck incision is followed.

Complications

- Potential short-term postoperative complications include wound infection and hematoma or seroma formation. Appropriate surgical technique and drain utilization will typically suffice to prevent these complications.
- Failure to completely excise a sinus or fistula tract may lead to recurrent clinical manifestations. Subsequent surgery in such situations can be challenging. Whereas recurrence rates are approximately 3% for branchial anomalies with no preceding surgeries or infections, this rate rises to approximately 20% if there was a previous unsuccessful surgery. The recurrence rate following the excision of a sinus or fistula tract is approximately twice that following the excision of an isolated cyst.[2]
- Failure to properly identify and monitor the facial nerve when a type II anomaly of the first branchial cleft is being excised increases the risk of postoperative facial nerve paresis.
- The excision of second, third, and fourth branchial anomalies potentially places cranial nerves IX, X, XI, and XII at risk. Fibrosis from previous surgery or infection makes this morbidity more likely. The identification and monitoring of the recurrent laryngeal nerve when anomalies of the third or fourth branchial pouch are being excised can lessen this risk.[7]
- Unidentified entry into the pharynx during procedures involving anomalies of a branchial pouch can lead to pharyngocervical fistula formation and wound infection.

Discussion

Evidence-Based Medicine Question

What are the treatment options for pyriform sinus third and fourth branchial pouch openings?

See the previous discussion on the treatment of third and fourth branchial anomalies.

Editorial Comment

Branchial cysts and sinuses are the second most common congenital neck masses. Knowledge of the embryology of the branchial apparatus is crucial for making an accurate diagnosis, understanding the anatomy of these lesions, and excising them successfully. Despite advances in diagnostic modalities, ultrasound remains the imaging modality of choice in an uncomplicated branchial anomaly, with CT and MRI being reserved for the more complex lesions. The surgical management of branchial cysts and sinuses has remained essentially the same over the years except for the addition of endoscopic management of third and fourth branchial anomalies. The first attempt at excision represents the best chance for complete excision of the branchial anomaly, as the recurrence rate tends to increase with previous surgical procedures and infections.

Review Questions

1. While excising a congenital mass in the neck, a sinus tract is noted that runs between the internal and external carotid arteries and travels both superior and lateral to the glossopharyngeal and hypoglossal nerves. This tract is mostly likely an anomaly of what branchial apparatus?

   a. First

   b. **Second**

   c. Third

   d. Fourth

2. During the operative excision of a suspected branchial cleft cyst and tract, the tract is noted to course posterior to the internal carotid artery and between cranial nerves IX and XII. The internal communication of this tract is expected to course to the

   a. Tonsillar fossa

   b. Apex of the pyriform sinus

   c. **Base of the pyriform sinus**

d. External auditory canal

3. Which of the following syndromes is associated with branchial anomalies?

   a. **DiGeorge syndrome**

   b. Down syndrome

   c. Apert syndrome

   d. Pendred syndrome

Pediatrics-Facial Skeleton

OUTLINE

202. Mandibular Distraction

202

Mandibular Distraction

Noel Jabbour, and Jesse Goldstein

Introduction

The classic Pierre Robin sequence (PRS) refers to a constellation of physical findings characterized by microretrognathia and glossoptosis; cleft palate is an associated feature but is not required for the diagnosis of PRS. The posterior displacement of the base of the tongue functionally obstructs the airway, causing apnea, stridor, difficulty with feeding, and retarded growth. The clinical severity of this obstruction can range from subtle hypopneas, which may be noted only on a sleep study, to dramatic life-threatening respiratory compromise that requires emergent airway intervention.

Initial nonsurgical management of tongue-base-related obstruction includes prone positioning and placement of a nasopharyngeal airway. However, these measures may complicate already tenuous feedings and may increase the risk for sudden infant death in an unmonitored setting. Tongue-base-related obstruction has traditionally been surgically addressed by tracheostomy to bypass the obstruction. However, this carries a low, but real risk of mortality from mucous plugging and other airway compromise. For this reason, other surgical options, including tongue-lip adhesion (TLA) were developed to address the retrodisplacement of the tongue. However, high rates of dehiscence, feeding difficulties, and recurrence of obstruction have been reported.[1]

Mandibular distraction osteogenesis (MDO) has gained popularity as a treatment to address the underlying microretrognathia, which leads to tongue base collapse. While distraction osteogenesis was developed in the 1920s by a Russian orthopedic surgeon, it was not adapted for use in the mandible until the 1990s, and was not applied to neonatal patients with PRS until more recently. Since then, several studies have

demonstrated objective improvement in both feeding and airway measures, including reduced apnea-hypopnea index, relief of hypoxemia and hypercapnia, and increased rates of per oral nutrition. MDO also has been successfully used to alleviate airway obstruction in patients with other causes for tongue base collapse, including neurologic impairment.[2]

As microretrognathia and glossoptosis occur in a spectrum from mild to severe, careful history taking, physical examination, and preoperative planning is necessary to identify patients who may benefit from MDO.

Key Operative Learning Points

1. Patients with PRS are best treated by an interdisciplinary team, including Pediatric Otolaryngologists, Surgeons trained in craniofacial surgery, Neonatal Intensivists, Pulmonologists, Geneticists, and Speech-Language Pathologists.

2. The diagnosis of PRS is made clinically when microretrognathia and glossoptosis are detected. The normal difference between the maxillary and mandibular arches is usually less than 5 mm. In most infants with PRS requiring airway intervention, this distance of maxillary overjet resulting in class II occlusion is often greater than 10 mm.

3. A full airway evaluation prior to, or coordinated with, MDO is prudent as secondary airway lesions, such as laryngomalacia, subglottic stenosis, or tracheomalacia, are common.

4. Careful handling of soft tissue during access to the infant mandible is essential in avoiding iatrogenic nerve injury.

5. Co-linear vectors are important to maintaining symmetric distraction.

Preoperative Period

History

1. History of present illness

   a. It is important to take a careful birth history, including prenatal diagnosis by ultrasound or eliciting any complications with

pregnancy or delivery.

b. Birth history should also include any initial airway distress and need for airway intervention, including prone positioning, nasopharyngeal airway, or intubation.

c. Any symptoms of airway distress including stridor, increased work of breathing, cyanosis, or acute life-threatening events (ALTEs) should be discussed.

d. If the infant is feeding orally, the parents should be asked about a typical feeding, including the quantity of feeds, the duration of each feeding, and any concerns for aspiration. Decreased volumes or increased time for feeding may indicate a problem with the coordination of breathing and swallowing.

2. Past medical history

a. A careful review of the birth history, initial hospitalization, previous evaluations, and interventions to address airway and feeding concerns should be undertaken.

b. Any ALTEs or cardiopulmonary arrests should be discussed.

c. Other medical issues, congenital anomalies, or known genetic diagnosis should be reviewed.

Physical Examination

1. Examination of the airway

a. Observation of the infant breathing at rest may reveal signs of stridor or stertor, nasal flaring, subcostal or suprasternal retractions.

b. Flexible nasolaryngoscopy may be performed at the bedside to assess the patency of the choanae bilaterally, laryngomalacia, and degree of tongue base collapse. Due to the very stimulating nature of the examination, bedside laryngoscopy likely significantly underestimates the degree of tongue base collapse that exists while the patient is sleeping,

2. Examination of the palate (Fig. 202.1)

a. A cleft palate is often associated with PRS, but it is not always present and is not essential for the diagnosis. Varying degrees of

orofacial clefting can be seen with PRS from a normal palate to a bilateral complete cleft lip and palate. However, a Veau I or Veau II cleft palate is often noted.

3. Examination of the mandible

   a. Measurement of the discrepancy between the central portion of the maxillary alveolar process and the mandibular alveolar process can be made easily by placing the wooden end of a cotton-tipped applicator along the anterior edge of the mandibular gingiva in the midline. The patient can then be placed into occlusion. The maxillary gingiva will then touch the wooden applicator, creating a natural marking on the wood due to saliva. However, if this is unclear, then markings may be made by pinching with two fingers or by a marking pen. The distance from the tip of the applicator to the marking indicates the degree of maxillary overjet. The upper limit of normal is considered to be 5 mm. Care must be taken to avoid posterior pressure on the mandible, which can cause retropositioning of the mandibular condyle out of the immature glenoid fossa, thereby accentuating the maxillary-mandibular discrepancy.

   b. Mandibular asymmetry should be assessed to evaluate for hemifacial microsomia.

4. Craniofacial examination

   a. All patients with suspected PRS should undergo a thorough craniofacial exam ination to evaluate for common accompanying syndromic diagnoses. Evaluation of the shape of the head can identify co-existing craniosynostosis. Orbital morphology can help distinguish Stickler syndrome, 22q deletion syndrome, or Treacher-Collins/Nager syndrome. Malar projection should be noted as should any anomalies of the ear, including microtia, pre-auricular remnants, or branchial arch anomalies. Assessment of the maxillary projection is critically important. Patients with significant maxillary hypoplasia may demonstrate minimal maxilla-mandibular discrepancy despite having severe micrognathia.

FIG. 202.1 Preoperative view of oral examination in an infant with Pierre Robin sequence. Microretrognathia, glossoptosis, and a wide Veau II cleft palate are noted.

Imaging

Computed tomography (CT): a craniofacial CT including 3D reconstructions is carried out in advance of surgery for preoperative planning of osteotomy sites and placement of the distractor (Fig. 202.2).

Indications

1. Patients with tongue base collapse due to microretrognathia who demonstrate signs of airway obstruction by increased work of breathing, desaturation, hypoxemia, hypercapnia, or obstructive sleep apnea on polysomnogram.

2. Patients with tongue base collapse due to microretrognathia who have been intubated and are not able to be safely extubated due to their severe microretrognathia.

3. Patients with an existing tracheostomy who cannot be successfully decannulated due to microretrognathia and tongue base obstruction.

Contraindications

1. Medical co-morbidities with increased risk for general anesthesia.

2. Significant secondary airway lesions that cannot be addressed without tracheostomy.

3. Severe central sleep apnea. In patients with mixed apnea, it has been demonstrated that many of the central apneic events noted on sleep studies improve after resolution of the obstructive component. However, patients with severe central sleep apnea or central hypoventilation will require positive pressure ventilation and should be considered for a tracheostomy.

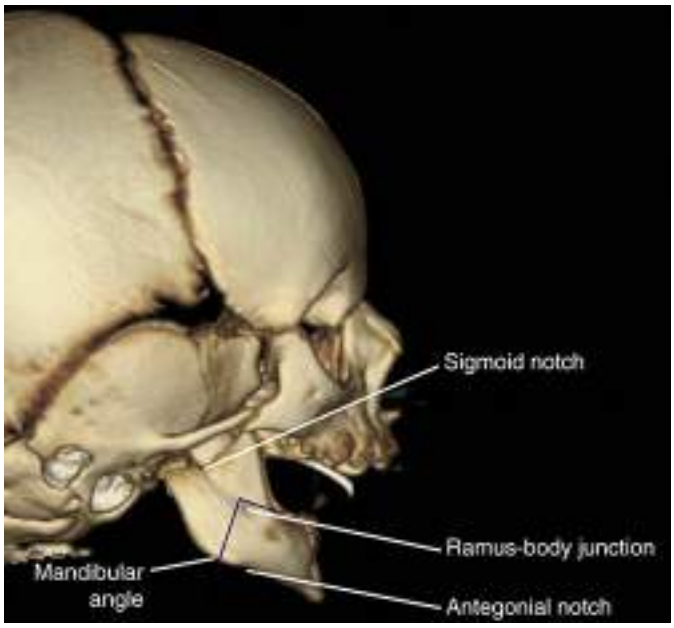

FIG. 202.2 Computed tomography scan of the mandible with 3D reconstruction showing key landmarks in white and planned “inverted-L” osteotomy in blue. This osteotomy position avoids the most posterior developing tooth bud, which is generally located in the position marked “Ramus-Body Junction.” Significant maxillary-mandibular discrepancy is noted.

Preoperative Preparation

1. Photo-documentation (Fig. 202.3)

2. Polysomnogram

3. Bedside nasolaryngoscopy

4. Flexible sleep endoscopy and rigid laryngoscopy and bronchoscopy

5. CT scan of mandible with 3D reconstruction

Operative Period

Anesthesia

General: Intubation of patients with PRS is often very challenging due to the microretrognathia. Assistive devices, such as a videolaryngoscopy, may be helpful in intubation. In our center, we perform laryngoscopy and bronchoscopy with an endotracheal tube loaded on a Hopkins-rod telescope. The endotracheal tube is passed over the Hopkins-rod telescope in a Seldinger technique when the scope is just above the carina. Often a suture in the tongue is employed to distract the tongue anteriorly during laryngoscopy.

Positioning

Supine: The patient is positioned on a shoulder roll such that the neck is extended and able to be turned from side to side.

Perioperative Antibiotic Prophylaxis

Weight-based cephazolin is administered within 30 minutes prior to the skin incision. Prophylactic antibiotics are continued until the extension rods are removed when activation is complete.

Monitoring

None.

Instruments and Equipment to Have Available

1. Fifteen blade
2. Small tenotomy scissors
3. Periosteal elevator
4. Mosquito hemostats
5. Piezoelectric Saw (DePuy Synthes, West Chester, Pennsylvania), or similar
6. KLS Martin Micro-Zurich ratcheting mandibular distractor set (KLS Martin, Jacksonville, Florida), or similar
7. Soft tissue instruments (needle drivers, pickups, suture scissors)
8. Loupe magnification
9. Narrow malleables

Key Anatomic Landmarks

1. Inferior border of the mandible
2. Platysma muscle
3. Deep cervical fascia
4. Submandibular gland
5. Mandibular angle
6. Antegonial notch
7. Retromolar trigone region
8. Sigmoid notch

Prerequisite Skills

1. Experience with submandibular/Risdon approach to the mandible

2. Experience with craniofacial osteotomies and fixation techniques

3. Experience with the surgical care of neonatal patients

Operative Risks

1. Early complications:
   a. Pin-site infection
   b. Hardware failure
   c. Injury to the marginal mandibular nerve
   d. Asymmetry
   e. Failure to relieve airway obstruction
2. Late complications:
   a. Growth restriction/relapse requiring further airway intervention
   b. Inferior alveolar nerve/mental nerve insensibility
   c. Damage to second/third molar tooth follicles

Surgical Technique

- Prepare/drape, excluding the oral cavity from the operative field
- Mark a 2 cm incision 1 cm below the mandibular border extending from the angle anteriorly in a relaxed skin tension line

FIG. 202.3 A typical preoperative view showing marked microretrognathia **(A)** and a postoperative view of the same patient just prior to removal of distractor hardware **(B)**. The mandible is being gently guided into occlusion. Resolution of the class II occlusion has been achieved. Minimal scarring is noted from the incision and extension rod sites.

- Infiltrate with local anesthetic/epinephrine
- Access the mandible:
  - Sharply dissect through skin, subcutaneous tissue, and platysma
  - Bluntly dissect through investing cervical fascia, just above the submandibular gland parallel to the course of the marginal mandibular nerve
  - Dissect in this plane superiorly to the inferior border of the mandible at the level of the antegonial notch
  - Sharply incise the pterygomasseteric sling
- Dissect the mandible in the subperiosteal plane to identify the following landmarks (mandibular angle, body-ramus junction, which is immediately opposing the retromolar trigone, antegonial notch, sigmoid notch)
- Mark out an "inverted L" osteotomy extending posteriorly from the trigone, then inferiorly to the border of the mandible at the antegonial notch (Fig. 202.4)
- Cut/bend the distractor to fit along the inferior border of the mandible so there is one plate on either side of the marked osteotomy
- Create an exit site behind the lobule of the ear for the distracter barrel. To avoid injury to the facial nerve or its branches, make a skin only incision at the desired exit site and then bluntly dissect between the angle of the mandible and the exit site to create a tunnel.
- With the piezoelectric saw[3], make two-thirds of the osteotomy, but do not complete the osteotomy
- Place the distractor into the pocket with the barrel exiting posteriorly through the pin site

- Fixate the distractor to the mandible with 6 mm 1.0 screws
- Complete the osteotomy with the piezoelectric saw
- Activate the distractor to ensure completion of the osteotomy, then reverse the distractor until bone segments are in contact
- Irrigate the pocket and close in a layered fashion (3-0 vicryl, 4-0 vicryl, 5-0 monocryl)
- Repeat on contralateral side, making sure that the distraction barrels are parallel to each other

Common Errors in Technique

1. Traumatizing the marginal mandibular nerve can occur either during the placement or the removal of the devices. Care should be taken to use a non-traumatic technique and to avoid monopolar electrocautery.

FIG. 202.4 Intraoperative photo of mandibular distractor placement showing activation rod exiting just inferior to the lobule.

2. Disparate distraction vectors: avoid these by ensuring that the distractor barrels are placed parallel to the mandibular boarder. Prepare both sides of the mandible and ensure vectors are co-linear by placing malleables on the barrels, pointed anteriorly, and confirming they are parallel.

Postoperative Period

Postoperative Management

1. The patient is transferred directly to the neonatal intensive care unit (NICU) intubated. Signs are placed in the NICU bed and in the patient's chart indicating that the patient is a "critical airway." Deep sedation is achieved with a combination of fentanyl and midazolam not only to minimize movement but also to avoid continuous infusion of paralytics.

2. The head of the bed is elevated 30 degrees.

3. An additional analgesic (acetaminophen) dose is given 30 minutes prior to the turns of the activation rods.

4. Continuous feeds via a nasogastric tube are started 24 hours after surgery

5. Pin site care: bacitracin ointment three times daily for 2 days, then change to dilute hydrogen peroxide solution.

6. Antibiotics are continued until distractor extension arms are removed.

7. There is a 24 to 48 hours latency period prior to activating distractors.

8. The activation rods are turned at a rate of 2 mm daily divided into twice daily turns (each side) for 5 days in order to rapidly clear the airway for extubation, followed by 1 mm daily (once a day) until distraction is complete.

9. Steroids are administered 24 hours prior to extubation.

10. Extubation is usually performed on postoperative day 5 in the operating room with airway equipment available for intubation if needed. Usually, laryngoscopy and tracheoscopy are performed to rule out any granulation tissue or other causes of potential airway obstruction secondary to intubation. Flexible nasolaryngoscopy can be performed as well to assess the position of the base of the tongue post-extubation.

11. Turning of the activation rods is discontinued when it is deemed that the airway is widely patent without collapse of the base of the tongue as confirmed by bedside flexible nasolaryngoscopy.

12. Distractor extension arms are then removed at the bedside after confirmation of airway patency.

13. Six to eight weeks is given for consolidation prior to removing the distractor (see Fig. 202.3B).

Complications

1. Injury to the facial nerve—If weakness of the facial nerve is noted postoperatively, this may represent neuropraxia due to retraction and should improve in several weeks. Transection of the marginal mandibular nerve is rare if following the above approaches to the mandible and reoperation for neurorrhaphy is not usually undertaken.

2. Persistent airway obstruction—In large series, the "failure" rate of mandibular distraction has been estimated to be just under 10% of cases. That is, 10% of patients may still require tracheostomy. This should be clearly explained to parents preoperatively. Vigilant attention to preoperative airway assessment and postoperative evaluation prior to completion of distraction may be useful in minimizing this risk.

3. Hardware failure—Whenever introducing hardware into the human body there is a risk of failure. Most concerning is the "backing down" of the distractors, but translocation of the pins within the bone has also been observed. To avoid these, chose a distractor system with a ratcheting mechanism that ensures "one-way" movement, and make sure to have at least four solid screws on either side of the osteotomy.

4. Wound infection or pin site infection—This is a relatively common complication, which can be minimalized by adhering to strict pin site care.

Alternative Management Plan

1. For patients with very mild symptoms, watchful waiting and home monitoring may be considered. An outpatient sleep study may be prudent to ensure that sleep apnea is not overlooked.

2. MDO may also be performed with external distraction devices. In this technique, the mandible is exposed with either an external or internal

approach; osteotomies are performed near the angle of the mandible. Two transcutaneous pins are fixated on either side of the osteotomy and secured to the external distraction device. Distraction and consolidation phase care is similar to the internal device method, except that the patient must wear the external distractor during the consolidation phase.

3. TLA may be considered in the patient who has relatively normal occlusion but significant collapse of the base of the tongue. In some centers, this is still routinely performed as a primary surgery instead of MDO.

4. Tracheostomy with or without gastrostomy must be considered in patients who are not good candidates for either MDO or TLA.

Discussion

Evidence-Based Medicine Question

Is mandibular distraction cost effective compared to tracheostomy in the management of neonatal tongue base obstruction?

New surgical tools and techniques often provide elegant solutions to longstanding problems potentially at significant increased cost relative to current standards of care. Therefore, it would seem that MDO may be costly due to the nature of the surgery and the expense of the implanted device. However, two separate costs analyses have been performed comparing MDO to the previous standard of care: tracheostomy.[3]

Recently, a cost analysis from Nova Scotia by Hong et al.[4] compared 21 patients who underwent MDO to 31 patients who underwent tracheostomy. The average total cost of MDO was found to be $57,649 CAD ($43,184 USD), and the cost of tracheostomy was $92,164 CAD ($69,040 USD). In this study, MDO had a higher operative cost and equipment cost, but a significantly lower cost related to hospital length of stay.

An earlier study in the United States, by Kohan et al.,[5] reported that the total cost of care for MDO was nearly half of that for tracheostomy. The average per patient cost for MDO was $193,126 USD compared to $382,246 USD for tracheostomy. The majority of the increased expense

was from costs associated with hospital stay. Postoperatively, decreased costs were also mostly related to decreased rates of inpatient pneumonia care and emergency room visits.

Both of these studies demonstrate that the initial cost of MDO is greater than that for tracheostomy due to operating room cost and equipment cost. However, the cost of hospital stay, home nursing, home-care equipment, hospital charges for subsequent tracheostomy evaluations, and increased emergency department visits make tracheostomy an expensive intervention when considering total cost per patient. Thus, from a cost perspective, MDO compares favorably to tracheostomy, with significant long-term cost savings.

Editorial Comment

Mandibular distraction offers a relatively new tool in the armamentarium of surgeons caring for patients with micro/retrognathia. Traditionally, the surgical treatment for these patients was primarily limited to two surgical procedures, TLA and tracheostomy. Each of these procedures has its own set of complications.

This chapter outlines the preoperative assessment of patients with micro/retrognathia, and the operative and postoperative care for MDO. As this is a relatively new tool, parents should be cautioned that there are limited data on the long-term dental and orthodontic outcomes associated with this procedure. However, the inverted-L osteotomy described above, should, theoretically, minimize the possible trauma to the molars.

Data does support the use of mandibular distraction to improve both sleep apnea and dysphagia in patients with mandibular distraction. Readers should note that this chapter primarily focuses on internal distraction devices, which are used in a large number of centers. Some centers do use external distraction devices. Further description of this technique can be found in the references.

Review Questions

1. Potential short-term complications from mandibular distraction osteogenesis (MDO) include all of the following, *except*:

   a. Pin-site infection

   b. **Growth restriction**

   c. Marginal mandibular nerve injury

   d. Asymmetry

   e. Failure to relieve airway obstruction

2. Potential long-term complications from MDO include which of the following?

   a. Growth restriction/relapse requiring further airway intervention

   b. Inferior alveolar nerve/mental nerve insensibility

   c. Damage to second/third molar tooth follicles

   d. Marginal mandibular nerve weakness

   e. **All of the above**

3. Compared to tracheostomy, MDO has been shown to have decreased costs related to all of the following *except*:

   a. Hospital stay

   b. **Operative procedure**

   c. Emergency department visits

   d. Care for pneumonia

   e. Total per-patient cost

Otitis Media, Myringotomy, Tympanostomy Tube, and Balloon Dilation in the Pediatric Population

Cuneyt M. Alper

Introduction

Myringotomy is the creation of an opening in the tympanic membrane (TM) with the use of a knife. *Tympanocentesis* is defined as the performance of this operation with a needle. Myringotomy or tympanocentesis may be indicated when there is an urgent need for relief of pressure and pain, to obtain a bacterial sample before the initiation of antibiotic treatment, or when there is a high risk of an unknown pathogen; it may also be done when a delay in definitive surgical treatment is anticipated owing to the need for further testing, imaging, or preparation for the medical or surgical treatment. Indications for these two procedures may overlap; however, myringotomy is preferred when there is a need for a broader opening that can stay open longer.

Key Operative Learning Points

- Tympanocentesis involves puncturing the TM with a needle in order to relieve pressure and/or obtain an effusion sample for culture and sensitivity.
- Myringotomy involves making an incision in the TM with a knife in order to achieve a larger, longer-lasting opening for better drainage.
- There are very limited indications for myringotomy and

tympanocentesis in the treatment of acute otitis media (OM).

- The most common indication is urgency in creating an opening in the TM.
- Myringotomy may be considered when a child with acute OM (AOM) or OM with effusion (OME) is under anesthesia. Temporary opening of the TM is conveniently achieved under anesthesia to relieve pressure and pain in the presence of AOM with a bulging TM. There is also the small potential benefit of earlier resolution of AOM or OME with myringotomy.
- The safest location for tympanocentesis is the anteroinferior quadrant of the TM.
- The anterior superior quadrant may be chosen because of the deeper space between the TM and the promontory.
- Tympanocentesis is preferred when there is a need to obtain a quick sample of the effusion; myringotomy is preferred when there is a need for a longer-lasting opening of the TM in order to ensure adequate relief of pressure with prolonged drainage through the TM. This is typical when medical management is the more likely treatment course.
- In order to extend the benefit of continued drainage through the unhealed TM after a myringotomy, the horizontal incision may be extended in a "smile" shape from anteroinferior to posteroinferior.
- Myringotomy is not reasonable if there is already a plan to insert a ventilation tube (VT) within the next several hours or the next day.
- Neither procedure would be indicated if there were no otologic complication, no suspicion of a complication, the child were not in pain with a bulging TM, and the choice of antibiotic would not be affected by an effusion sample.

Preoperative Period

History

- AOM with severe pain, leading to constant crying and the inability to sleep

- Persistent high fever (>104°F) despite the administration of analgesics and antipyretics for more than 48 hours
- Persistent AOM with ongoing fever (>102°F) and moderate to severe pain for more than 5 to 7 days
- Multiple failures of treatment with antibiotics in the presence of an AOM episode
- Newborn with an AOM (in the first 4 weeks of life) because of the likelihood of unusual bacteriology not suitable for routine antibiotic choices[1]
- OME with sepsis even though there are no acute signs or symptoms of AOM
- AOM in the intensive care unit (ICU) or neonatal ICU (NICU), when it is not feasible or preferred to take the child to the operating room
- Fever of unknown origin in a child with middle ear effusion (MEE) in the ICU, as part of the work-up for fever of unknown origin in a child with middle ear effusion in the ICU[2]
- Fever of unknown origin in an immunocompromised child with a MEE even in the absence of signs or symptoms of an AOM
- Suspicion of an otologic complication when an early sample of MEE for culture and sensitivity will be beneficial and/or for relief of pressure and pain from the OM. Other indications include a need for time for further re-evaluation (such as imaging) and/or when there will be a delay in initiating definitive surgical treatment.
- Presence of an otologic complication, when obtaining an MEE sample for culture and sensitivity, prior to the initiation of intravenous empiric antibiotic therapy will be beneficial. This is done first to obtain a stat Gram stain to narrow the antibiotic options instead of starting double or triple therapy and, second, to discontinue or change the previously initiated antibiotics.

Physical Examination

- High (>104°F) fever

- Severely bulging TM with an imminent perforation, manifested by localized bulging of the TM and/or the presence of one or multiple bullae on the TM filled with purulent material[3]
- Behavior consistent with severe pain originating from the ear, such as holding or pulling at the ear with constant crying and the inability to sleep
- When there are signs and symptoms and/or imaging evidence of an extracranial or intracranial complication, tympanocentesis or myringotomy is considered for culture purpos and to create means of drainage through the TM in order to reduce the progression of the conditions that caused the complications, and/or to prevent additional complications.

Imaging

- Imaging is not necessary for the performance of tympanocentesis or myringotomy procedures; however, it may be necessary in order to assess the ear and possible complications.

Indications

- Severe otalgia. Tympanocentesis or myringotomy is a painful procedure. However, if there is severe ear pain from the OM or its complications, the procedure is considered to be justified because it can instantly resolve pain due to the stretch and pressure of the TM from the purulent exudate confined in the middle ear (ME). If the otalgia does not improve after tympanocentesis and myringotomy, there may be blockage of the drainage pathways between the mastoid and the opening on the TM. Limitation or complete blockage of the drainage pathways may be due to (1) lack of ME space owing to significant mucosal hypertrophy and/or the formation of granulation tissue (which is more commonly seen in *Streptococcus pyogenes* infections), (2) obstruction of the anterior and posterior isthmus connecting the epitympanum to the mesotympanum, (3) obstruction of the aditus ad antrum connecting the antrum to the epitympanum, and (4) blockage of aeration/drainage pathways within the mastoid, most commonly by Koerner's septum between the lateral and medial groups

of mastoid cells.

- To have a controlled TM perforation at a preferred location. The site of most TM fullness and bulging is commonly at the posterosuperior quadrant. This is more commonly the case if the mucosal folds between the stapes, incus, and malleus limit communication between the epitympanum and mesotympanum. If a perforation at the posterosuperior quadrant does not heal, sequelae and/or complications are more likely. If the TM heals, the healed TM section may be atrophic and therefore will be more prone to the development of retraction pockets, cholesteatoma, and erosion of the ossicles. Any secondary acquired (from perforation) or primary acquired (from a retraction pocket) cholesteatoma developing at the posterosuperior quadrant will pose a higher risk of ossicular erosion, hearing loss, extension to the attic and into the mastoid, and other complications. Therefore a controlled opening of the TM will likely relieve pressure on the TM in the posterosuperior quadrant and lessen the chance of sequelae and complications.
- In order to identify the pathogen prior to starting antibiotic treatment.[4] If an intravenous antibiotic is administered, it will pose the risk of producing a negative culture result. In an infectious condition where selection of the correct antibiotic as quickly as possible has critical importance, accurate identification is secured by tympanocentesis or myringotomy. This procedure also narrows the spectrum of antibiotics by getting a stat Gram stain, which not only differentiates between gram positives and gram negatives but also points to characteristics of the organisms that may help in narrowing down the possibilities, thus helping to determine the choice of antibiotic.
- To relieve the pressure in the presence of an otologic complication until imaging is performed and/or the patient/preoperative workup/surgical team is ready. A patient may have or be suspected to have a complication from OM. To verify the presence of a complication or for surgical planning or preparation, there may be a need extra time, during which the purulent exudate under pressure from OM that is suspected to have caused or has the potential to cause a complication has the potential to progress and worsen. To release the purulent effusion under pressure in the middle ear, in the presence or suspicion of an otologic comuntil imaging is performed and/or the patient/

operating room/ surgical team are ready, tympanocentesis or myringotomy can buy time and also lessen the risk for progression of complications until definitive treatment can be administered.

- To identify the pathogen precisely in a patient with a high risk for a fulminant or aggressive infectious course (immunocompromised, ICU, NICU). While awaiting identification of the pathogen in such patients, it is more important to instantly identify the group and likely species of the pathogen.
- To identify a pathogen that is likely to be highly resistant. Because many bacteria are highly resistant today, it is helpful to have a sample for culture and sensitivity with results obtainable within days.

Contraindications

- When the indications are not strong enough to justify a painful procedure to be done in an awake patient. These procedures are painful. In the absence of concern for a complication, the sole justification is extreme pain and the goal of relieving it. If there is not much pain, the procedure is not necessary.
- When it is not possible to perform such a procedure safely (applicable to awake procedures). Performing tympanocentesis or myringotomy safely requires almost complete immobility of the patient. This is achieved by restraining the child with the help of parents or support staff. Additional restraint can be achieved by using a papoose or by swaddling a newborn or an infant with a sheet. Such restraints may not be acceptable to the parents.
- When a child is above 2 or 3 years of age, this painful procedure under restraint may be too traumatic, having a lasting negative effect on the child's relationship with the physicians and even the parents who permitted it.
- When a child is very strong, almost complete restraint may not be possible, making it unsafe to instrument the ear canal and TM with sharp instruments. Any sudden movement, even of a few millimeters, can lead to inadvertent ear canal trauma and bleeding, making instrumentation even more challenging. Furthermore, if a larger than planned opening or an irregular incision in the TM is produced, it

could pose a greater risk for permanent perforation or cholesteatoma formation with inversion of irregular edges of the TM.

- When the patient and/or parents have previously experienced similar procedures under restraint, it may be impossible to convince them of the need of tympanocentesis or myringotomy.
- Topical anesthesia with lidocaine solution takes a long time to implement and is not very effective. The use of phenol may pose a risk for spilling or spreading inadvertently and therefore may be dangerous in a noncompliant child.
- When these procedures cannot be done without anesthesia or if the "nothing by mouth" (NPO) status is a contraindication
- When preparation/performance of these procedures may delay the necessary workup or initiation of treatment
- When there is already an indication for VT placement, a separate procedure of tympanocentesis or myringotomy may not be justified. Therefore the need and timing of these procedures may be adjusted according to the circumstances.

Preoperative Preparation

- Assess the optimal conditions for the procedure based on the indications and priorities. The options are performing the procedure under general anesthesia, with topical anesthesia, or with no anesthesia but possible analgesia. These decisions will be made based on the indications, alternatives, risks, and the timeline of planned evaluation and treatment.
- If the procedure is to be done under general anesthesia, verify NPO status and the potential contraindications for general anesthesia.
- If the procedure is to be done under topical anesthesia or no anesthesia, it is necessary to spend sufficient time with the child and family to prepare them, explaining what to expect, and to consider administering analgesia.

Operative Period

Anesthesia

- General
- Awake sedation
- Topical anesthesia
- No anesthesia with analgesia

Although this procedure can be done with the patient awake or under sedation, general anesthesia is preferred for patient comfort. Based on the indications, conditions, and limitations, one of the previously mentioned options may be preferred. When there is an urgency to perform tympanocentesis or myringotomy in the clinic, emergency department, ICU, or NICU for the reasons outlined earlier, the options should be discussed with the family, the child (if of an appropriate age), and the other physicians/health care professionals and services as applicable.

Positioning

- Supine: The patient is positioned supine with the head turned away from the surgeon for each ear.

Perioperative Antibiotic Prophylaxis

None necessary

Monitoring

None necessary

Instruments and Equipment to Have Available

- Operating microscope
- Otoscope for outpatient or bedside tympanocentesis or myringotomy

- Speculum, curette, myringotomy knife, suction, 5-, 7-, and 3-Fr suction catheters
- For culture purposes, an attached suction trap for collecting the effusion or a swab to touch the effusion by inserting it into the canal
- For tympanocentesis in the office or at bedside, an 18-gauge spinal needle attached to a tuberculin syringe to withdraw after going through the TM

Key Anatomic Landmarks

- Manubrium malleus, parts of umbo, and lateral process (Fig. 203.1)
- Pars flaccida and pars tensa
- Pars tensa quadrants
- Annulus

Prerequisite Skills

- Microscope use and handling of the instruments (Fig. 203.2A to E)
- Cleaning of the ear canal

Operative Risks

The procedure has risks mostly associated with either inadequate restraining, inexperience, or both. These risks include trauma and bleeding from the ear canal, TM, and/or ME mucosa. One very serious but extremely rare risk is damaging the TM and/or disrupting the ossicular chain. Failure to identify the anatomic landmarks, especially with an inflamed swollen ear canal and TM, may increase the risk for misplaced opening of the TM, especially in less experienced hands.

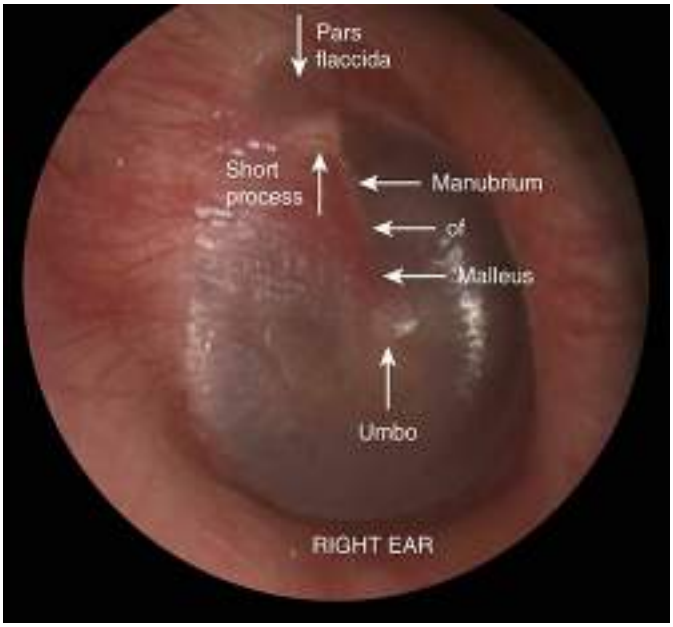

FIG. 203.1 Tympanic membrane landmarks.

It is critical to identify the landmarks to be able to perform tympanocentesis or myringotomy in the correct location and to avoid complications.

FIG. 203.2 **A,** The speculum is held as shown for the right ear for a right-handed surgeon; the third finger is placed in the concha to retract the pinna in the posterosuperior direction so that the ear canal can be straightened with one hand. **B,** The speculum is held as shown for the left ear for a right-handed surgeon; the third finger is passed inferior to the speculum and placed in the concha to retract the pinna in the posterosuperior direction so that the ear canal can be straightened with one hand. **C,** If a trap with suction is not available, tympanocentesis may be performed with a spinal needle and a tuberculin syringe. **D,** To handle the myringotomy knife, the thumb and index finger hold the handle while the third finger stabilizes the shaft of the knife, freeing up the fourth finger to be anchored on the speculum edge and the fifth finger to be anchored on the head if possible. **E,** Bimanual handling of the speculum, myringotomy knife, and suction. Instruments are held as described earlier, both fourth fingers anchored on the

speculum and both fifth fingers anchored on the head for stabilization.

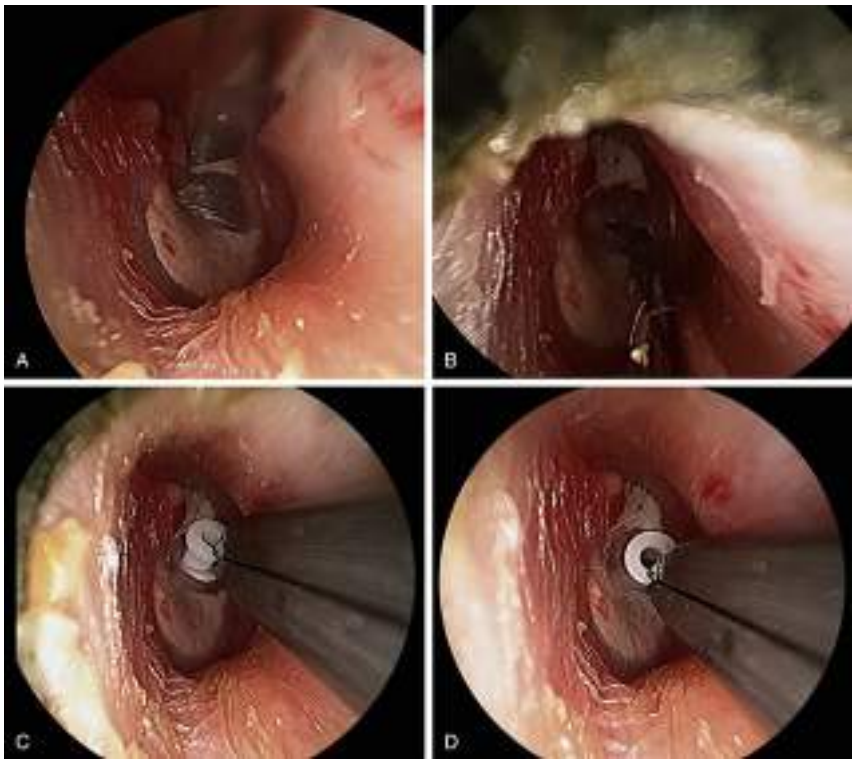

FIG. 203.3 **A,** Performance of a radial myringotomy at the anteroinferior quadrant of the tympanic membrane (TM). The incision size should not exceed a third of the length between the umbo and the annulus. **B,** Aspiration of effusion if present. **C,** Initially halfway insertion into the TM incision is adequate. The tube will be stable when released, pushing the ventilation tube (VT) into the incision in the same direction, as the tube is initially held with the alligator forceps may result in trauma to the TM, especially from the leading edge of the outer flange. **D,** Complete insertion of the VT requires a shift in the axis of VT from the initial insertion angle to the end result, where the VT shaft is parallel to the TM surface. This 30- to 45-degree change in the axis of the VT is easily achieved by pushing the outer flange with the barely open tip of the alligator forceps, applying gentle pressure from the lateral most aspect of the tube perpendicularly toward the incision but without holding the VT. This

maneuver can also be achieved with a Rosen needle. Both methods lead to the least traumatic method of VT insertion.

Surgical Technique

- Stabilize the child and the head.
- Use the third finger of the holding hand to push the concha posterosuperiorly in order to straighten the ear canal (see Fig. 203.2A and B).
- Place the fourth and fifth fingers at the edge of ear speculum and on the head, respectively, in order to stabilize the instrumentation and to prevent inadvertent injury from movement of the anesthesiologist or the patient.
- Clean the ear canal for complete visualization of the TM.
- Reorient the center of the field of the microscope toward the anteroinferior (or any other preferred) site.
- If the microbiologic information is critical, sterilize the ear canal with 70% alcohol for 1 minute, then dry it completely before making the incision.
- Make a circumferential incision parallel to the annulus, halfway between the umbo and the annulus. If the myringotomy is to be kept open, create a smile-shaped incision at the inferior part of the TM.
- If a tympanocentesis is performed, anteroinferior or anterosuperior quadrants are preferred, where there is a greater distance between the TM and the promontory.

Common Errors in Technique

- Inadequate stabilization of the child and/or the head
- Suboptimal use of microscope for visualization and magnification
- Failure to work atraumatically

Postoperative Period

Postoperative Management

- Ear drops
- Gram stain- and culture-directed antibiotic treatment as indicated

Complications

- Trauma to the external ear canal is usually due to inadequate restraint. Such trauma is rarely serious, but it is often painful and makes the procedure more challenging owing to worsened movement and obstruction of landmarks from the bleeding.
- Although extremely rare, with a traumatic procedure there is a potential risk of disrupting the ossicular chain.
- If a caustic agent such as phenol is used for local anesthesia on the TM, inadvertent application on a broad area may result in a large perforation. Inadequate securing of the phenol bottle may result in spillage and a chemical burn at the spilled site.

Complications are extremely rare in trained hands.

Alternative Management Plan

1. Initiation of antibiotic treatment without obtaining an effusion sample for culture and sensitivity is an option.

2. Similarly, more optimal pain management may obviate the need for tympanocentesis or myringotomy.

Discussion

Evidence-Based Medicine Question

Does the culture obtained with a tympanocentesis or myringotomy affect

the outcome?

In infants and children with AOM with a high risk of having an unusual or a resistant bacterium or in the presence of suspected serious complications, culture and sensitivity can facilitate an earlier and better outcome.[1,2] Immediate Gram stain results can narrow the guesswork regarding the likely organism and guide a more accurate selection of antibiotic treatment.

Access the review questions and additional sources list online at http://www.expertconsult.com

Review Questions

1. Indications for myringotomy include all of the following, except

   a. **New-onset AOM**

   b. Constant crying in a febrile infant with a bulging eardrum

   c. Failed third-line antibiotic therapy for OM in a symptomatic child

   d. AOM in an immunocompromised child in the ICU

2. The following statements about tympanocentesis and myringotomy are accurate, except

   a. Tympanocentesis and myringotomy can be performed in office or at bedside

   b. **Tympanocentesis provides an adequate opening on the TM for continued drainage**

   c. Myringotomy may be extended to prevent early closure and provide adequate ongoing drainage

   d. Both can be performed prior to the first dose of antibiotics in children with suspected complications

3. Anesthesia required for tympanocentesis or myringotomy includes all of the following, except

   a. General anesthesia

   b. Topical anesthesia

   c. No anesthesia

d. **Nerve block**

Ventilation Tube

Introduction

A ventilation tube (VT) is inserted after the myringotomy in order to prevent closure of the TM.

Key Operative Learning Points

VTs are beneficial when there is a need for a long-lasting opening to drain the MEE, reduce the risk of a new OM, and equalize the pressure between the ME and the ambient.

Preoperative Period

History

Chronic OM with effusion (COME)

Recurrent AOM

Delayed development of speech

Eustachian tube dysfunction (ETD)

Recurrent barotrauma

Physical Examination

MEE

AOM

Retraction of the TM and/or retraction pocket

Precholesteatoma

Cholesteatoma

Imaging

Not necessary for VT insertion

Indications

COME with hearing loss for 3 months or longer if bilateral and 6 months or longer if unilateral

Recurrent AOM, three or more episodes in 6 months or four or more in a year, one being recent, and presence of effusion during the

consideration of VT insertion[1]

Intracranial or extracranial complication from AOM in addition to treatment of the complication

Recurrent or chronic otalgia or pressure from ETD

Recurrent perforation of the TM

Significant conductive hearing loss from effusion

If there is significant atrophy and severe retraction of the TM, especially in the likely sites for VT insertion (which poses an increased risk of early extrusion) or if there is a prediction that the patient will need VTs for at least several years because of his or her age at the time of insertion and history of multiple sets of tubes before this time, a long-lasting tube (T-tube) may be preferred.

Contraindications

None

Preoperative Preparation (See Section on Myringotomy)

None necessary

Operative Period

Anesthesia

General anesthesia

Older teenagers may tolerate topical anesthesia

Positioning (See Section on Myringotomy)

Supine: The patient is positioned supine with the head turned away from the surgeon for each ear.

Or same as Myringotomy.

Perioperative Antibiotic Prophylaxis

None necessary

Monitoring

None necessary

Instruments and Equipment to Have Available (See Section on Myringotomy)

Rosen needle

Alligator forceps

VT

Key Anatomic Landmarks (See Section on Myringotomy)

None necessary

Prerequisite Skills (See Section on Myringotomy)

None necessary

Operative Risks (See Section on Myringotomy)

Placement of too small an incision requiring a forceful and traumatic insertion

Placement of incision too close to the annulus increases the difficulty of

insertion.

Placement of too large a myringotomy incision poses the risk of medialization or early extrusion of the VT.

Placement of the incision in the posterior superior quadrant has the risk of injury to the ossicles, conductive hearing loss, and, after the extrusion of VT, atrophy or perforation at a site for higher risk of complications or sequelae.

Tearing of the thin/atrophic TM

Medial displacement of VT into the ME

Additional trauma and bleeding from insertion of the VT into the ear canal

Surgical Technique (See Section on Myringotomy)

Place a radial incision at the center third of a line between the umbo and annulus and suction the effusion (Fig. 203.3A and B).

Carry the VT with an alligator forceps away from the anterior bony overhang.

Insert the leading edge of the inner flange in a vertical direction (as much as possible) to the surface of the TM at the insertion site (see Fig. 203.3C).

Release the VT from the alligator when halfway inserted into the incision.

Push the outer flange of the tympanostomy tube at the most lateral edge of the VT with a barely open alligator forceps tip without holding the tube, allowing the tube to change its axis from insertion angle to the complete horizontal angle to the surface (see Fig. 203.3D). A Rosen needle can be used instead.[2]

Suction any residual effusion and/or blood, waiting adequate time to assess any further oozing of blood that can dry in or over the VT.

Instill ear drops and pump the tragus to facilitate passage of the drops through the tube VT and into the ME.

When a long-lasting tube is inserted, at least half of the shaft of the T-tube is cut off. Holding the flanges straight with the alligator forceps, slowly release the forceps when the tips of the flanges are past the incision so as to allow opening of the flanges in the opposite direction. Secure the proper positioning of the angle of the tube and flanges for optimal function and surveillance.[3]

If a long-lasting tube is inserted, special techniques will have to be used.[4] It is better to shorten the shaft of a T-tube by at least a half in order to reduce the risk of blockage, allow drops to go through more easily if needed, and reduce the risk of the tip of the shaft reaching the cerumen-producing site of the ear canal, leading to attachment of the shaft to the cerumen and the canal. This can result in earlier than desired extrusion of the tube. With T-tube having long flanges that are supposed to stay parallel to the TM, the flanges are straightened with the alligator forceps and released after passing through the incision site. A Rosen needle is often needed to insert or align the flanges and the shaft in the desired direction.

Common Errors in Technique (See Section on Myringotomy)

Trauma and bleeding of the ear canal, TM, and ME with the passing and insertion of the tube

Postoperative Period

Postoperative Management (See Section on Myringotomy)

Avoid exposure to dirty water, as in lakes and rivers.[5]

Avoid diving under water.

Complications (See Section on Myringotomy)

Failure to keep the VT in place due to the overly large myringotomy

incision

Medial displacement of the VT into the ME

Blockage of the VT from dried blood and/or effusion

Placement of the VT too inferiorly and centrally, resulting in limited drainage of effusion and increasing the risk of blockage when the inner opening of VT faces the ME mucosa on the promontory

Myringosclerosis

TM atrophy

Retention of VT

Otorrhea

Granuloma

Cholesteatoma

Alternative Management Plan (See Section on Myringotomy)

Watchful waiting for COME

Watchful waiting or repeated antibiotic therapy when indicated for the episodes of AOM

Adenoidectomy

Autoinflation for ETD and COME

Balloon dilation of the ET (BDET)

Discussion

Evidence-Based Medicine Question

Does insertion of a VT make a difference in speech and language development?

There is mixed evidence regarding the role of delayed VT insertion.

Major studies have failed to demonstrate a difference between early and late VT insertion for COME. However, despite this and because of the well-known association between hearing loss and speech delay, the criteria for insertion of a VT in a child with speech delay are different. As per the most recent guidelines for VT insertion, there is no need to verify the presence of effusion in order to decide for VT insertion when there is a speech and language delay. This modification in the guidelines for VT insertion clearly indicates that VT insertion makes a difference in speech and language development.

Access the review questions and additional sources list online at http://www.expertconsult.com

Review Questions

1. Recent (2013) clinical practice guidelines developed by American Academy of Otolaryngology - Head and Neck Surgery (AAO-HNS) on VT insertion for recurrent AOM suggest all of the following, except

   a. Three or more well-documented and separate AOM episodes in the past 6 months or four or more well-documented and separate AOM episodes in the past 12 months with at least one or more in the past 6 months

   b. Children should have unilateral or bilateral MEE at the time of assessment for tube candidacy, verified with pneumatic otoscopy or tympanometry

   c. Each AOM episode should qualify as moderate to severe bulging of the TM, new onset of otorrhea not due to acute otitis externa, or mild bulging of the TM and recent onset of ear pain or intense erythema of the TM

   d. **All of the above**

2. The requirement of presence of unilateral or bilateral MEE at the time of assessment for tube candidacy may be waived in the following conditions, except

   a. Permanent hearing loss independent of MEE

   b. Suspected or confirmed speech and language delay or disorder

   c. Developmental delay

d. **All of the above**

3. Long-lasting tubes may be considered in all the following conditions, except

   a. Very thin TM with ME effusion

   b. Severely retracted and atelectatic TM with ME effusion

   c. Multiple early tube extrusions

   d. **First set of tubes in an infant or toddler**

Balloon Dilation of the Eustachian Tube

Introduction

ME gas is constantly being exchanged with dissolved gas in the blood. This exchange would ultimately result in a pressure of approximately −600 mm H_2O if the ET were unable to open and supply a bolus of gas in order to replace the absorbed gas. The ET must remain closed to protect the ME from pressure variations, sounds, and secretions that might contain viruses and/or bacteria. The ET must also clear mucosal secretions and effusion. The present discussion regards the Eustachian tube function (ETF) that is relevant to the equalization of the ME pressure (MEP) to the ambient. The ET may open passively when the pressure gradient between the ME and the ambient exceeds the ET resistance from tissue pressures. The usual mechanism of opening of the ET is by widening of the ET with active muscular function while swallowing or yawning.[1] The ET may be unable to open under normal physiologic conditions owing to high tissue pressures around it (ET obstruction), inadequate active muscular function (ET functional obstruction), or a combination of both.[2] These conditions may be overcome by increasing the pressure gradient with the Valsalva maneuver, enhancing active muscle function with the Toynbee maneuver, or to do both with Diver's maneuver (Lowry technique). Devices are also used to enhance the ET's ability to increase intranasal pressure. The traditional and most common method of treatment is VT insertion, which temporarily bypasses the need for a pressure-equalizing function. However, new surgical treatment methods involving the ET have recently been described, including laser tuboplasty and cartilage framework tuboplasty or BDET.[3] Of these, the least invasive and most promising method is BDET. Despite a number of studies demonstrating its safety in adults, there is limited evidence on the efficacy of BDET for ETD.[4] While more studies are needed before routine clinical application for BDET, especially in

children, this chapter includes information regarding the indications, technique, and problems regarding BDET.

Key Operative Learning Points

ET tube anatomy

ETF and ETD

Types of ETD

Treatment options for ETD

Indications, technique, consequences, and potential complications of BDET

Preoperative Period

History

COME recurring after extrusion of tube and prior adenoidectomy

TM retraction or retraction pocket with progression

Recurrent barotrauma, otalgia, OME, AOM, or hemotympanum with exposure to significant ambient pressure changes (flying and diving)

Tympanoplasty or myringoplasty graft failures

Recurrence of retraction pocket or retraction pocket cholesteatoma after tympanoplasty

Physical Examination

MEE, AOM, hemotympanum

TM, retraction pocket, atelectasis, adhesive otitis

MEE or negative pressure with pneumatic otoscopy

Endoscopy of nasopharynx and ET orifice to rule out pathology causing ETD

Testing

Tympanometry showing type B or C or a large volume from a perforation or VT

Degree of ability to correct the MEP differences with swallowing, yawning or Valsalva, Toynbee, and Lowry maneuvers

ETF test with tympanometry, using the resident software and method or the 9-Step test

Sonotubometry

Inflation-deflation test

Forced response test

Tubomanometry

Other than the tympanometric tests, the mentioned test methods are available and used in a few centers; however, their sensitivity and specificity in diagnosing ETD are not well established. This brings a diagnostic dilemma, indicating that there is a risk for misdiagnosis of the ETD. Until studies establish better test methods to identify ETD and controlled studies demonstrate a clear benefit over the other treatment methods, the BDET procedure should be avoided, especially in children.

Imaging

CT scan of the temporal bone

Imaging is currently used to rule out anatomic abnormality and a dehiscent carotid canal; however, yield and benefit are questionable.

Indications

Development of significant negative MEP and/or MEE after extrusion of VTs

Development of barotrauma with unavoidable ambient pressure variations

Test results demonstrating ETD with obstruction

a. Test results demonstrating inability to passively open the ET despite large pressure differences

b. High opening and closing pressures

Test results demonstrating ETD with functional obstruction

a. Inability to open the ET despite the addition of swallow in the presence of large pressure differences

b. Inability to increase airflow with swallow

These indications imply that the BDET procedure could be indicated for ears that need reinsertion of a VT for significant negative MEP; its sequelae or complications include recurrent MEE or hemotympanum from barotrauma and test evidence of obstruction or functional obstruction of the ET.

Contraindications

Ears that do not develop MEE or significant sustained or recurrent negative MEP

Large adenoid tissue pad impinging the ET cartilage or blocking the ET orifice, in which case adenoidectomy should be performed first, and the ETD refractory to treatment should be verified

Untreated nasal allergies, chronic sinusitis, gastroesophageal reflux disease (GERD), in which case these conditions should be treated first and the ETD refractory to treatment should be verified

Patulous or semipatulous ET

Dehiscent carotid canal

ETD due to a skull base, parapharyngeal, or nasopharyngeal mass

Preoperative Preparation

None specific for BDET

Operative Period

Anesthesia

General anesthesia

Eustachian tube function

Positioning

Supine

Perioperative Antibiotic Prophylaxis

None necessary

Monitoring

None necessary

Instruments and Equipment to Have Available

Nasal speculum

Bayonet forceps

Zero-degree endoscope (thin and fat)

45-degree endoscope (thin and fat)

30- to 70-degree guide catheter

Balloon 6×16 mm^2 or 5×16 mm^2

Balloon inflation device

The instruments and BDET devices that are currently available are used for the balloon dilation of sinuses. Balloons and delivery devices specific for the ET are not currently available in the United States;

however, they are available in Europe and are being developed and tested in the United States and elsewhere.

Key Anatomic Landmarks

Choana

Torus tubarius

Fossa of Rosenmüller

ET orifice (Fig. 203.4A)

Prerequisite Skills

Endoscopic sinus surgery and balloon dilation skills and experience

Operative Risks

ET mucosal tears

Bleeding

Emphysema

False passage

Fracture of bony ET

Internal carotid artery injury or occlusion leading to ischemic cerebral injury

Surgical Technique

Use a topical nasal decongestant (oxymetazoline) for easier and less traumatic access through the nasal passages.

Examine the nasopharynx, torus tubarius, and nasopharyngeal orifice of the ET with 0-and 45-degree telescopes.

Load the balloon through the guide catheter up to the tip and pass through the nose (see Fig. 203.4B).

Position the guide catheter at the ET orifice in a superolateral direction (see Fig. 203.4C).

If there is significant resistance, pull back, assess the direction, check for false passage, and retry. If there is continued resistance, consider downsizing the balloon and reinsert.

Gently insert the balloon into the ET lumen (see Fig. 203.4D).

Make sure that the mark indicating the proximal end of the balloon is visible outside the ET orifice.

Inflate the balloon to 10 to 12 atm for 1 to 2 minutes, then deflate and remove.

Reexamine with an endoscope for any bleeding or complication (see Fig. 203.4E).

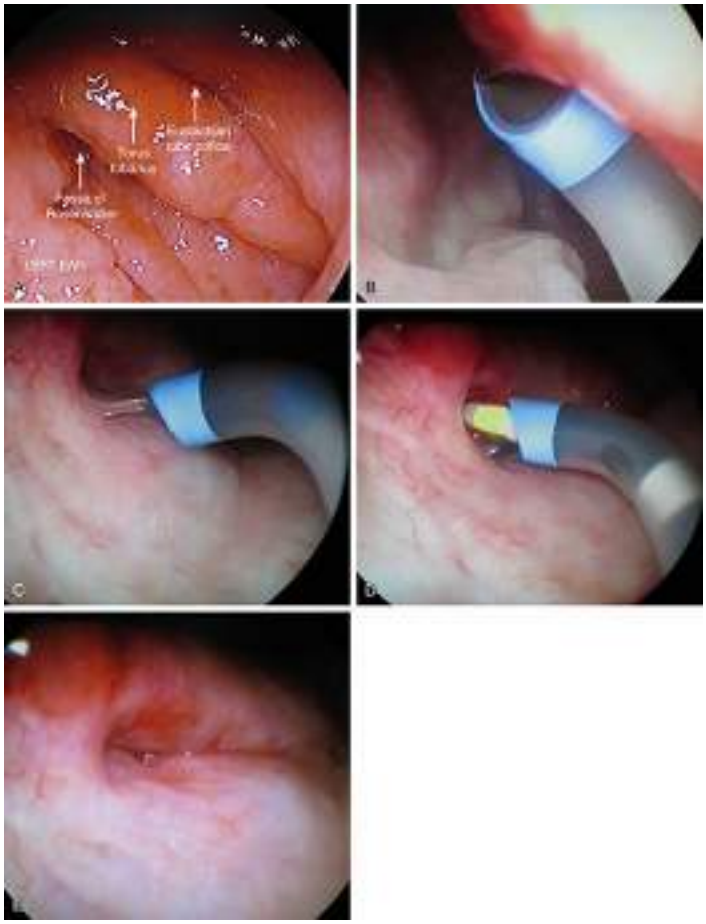

FIG. 203.4 **A,** Anatomic landmarks of the left Eustachian tube (ET) nasopharyngeal orifice. It is important to avoid

insertion to the fossa of Rosenmüller or a false passage within the ET lumen. **B,** Advancement of the guide catheter through the nasal passage is achieved after adequate decongestion, with the guidance of endoscopes. **C,** Positioning of the catheter at the ET orifice in the direction of the ET lumen. **D,** A balloon is inserted to the level of a yellow ring, and the pressure is increased by inflating the special syringe to the desired pressure for the desired duration. **E,** The appearance of postdilation ET orifice is checked with an endoscope before terminating the procedure (Acclarent 6×16 mm^2 sinus balloons and a 70-degree guide catheter with inflation device were used for the procedure displayed in the figures).

Common Errors in Technique

Failure to insert the balloon

Insertion of the balloon beyond the cartilaginous ET

Insertion of balloon into the fossa of Rosenmüller

Postoperative Period

Postoperative Management

Pain management, routine for the first 24 hours and as needed thereafter

Topical decongestant as needed for minor epistaxis

Patient cautioned to avoid blowing the nose for 1 week

Complications

Bleeding

Emphysema (if there is forceful nose blowing in the postoperative period)

Patulous ET (poses a higher risk if patient selection is without testing and verification of the "obstructive" ETD)

Alternative Management Plan

VT

Use of autoinflation maneuvers

Devices that enhance or facilitate nasal autoinflation

Discussion

Evidence-Based Medicine Question

There is currently no evidence that BDET is more effective than the control, even in adults.[4] Evidence is mostly subjective and based on some objective measures; sensitivity and specificity are questionable. Should the current noncontrolled limited evidence be considered sufficient to perform this procedure in patients suffering from ETD and its consequences and complications, especially in children?

Editorial Comment

When medical treatment for OM has failed, surgical treatment should be considered, as OM causes mild to moderate hearing loss that may interfere with speech-language development and balance as well as the child's quality of life. The most common surgical procedures for OM include myringotomy/tympanocentesis and tympanostomy tube insertion. Whereas myringotomy/tympanocentesis is currently performed mainly for more acute conditions, tympanostomy tube insertion has, since its introduction in the 1950s, become the most common outpatient surgery in children. This procedure has been shown to be efficacious for treatment of recurrent acute OM (rAOM), persistent COME, and ETD. In recent years balloon dilation, a new procedure, has been introduced for ETD and has gained popularity. However, the efficacy of this procedure has not yet been established. In an effort to avoid over- or undertreatment, guidelines for both physicians and

parents have been published recommending diagnostic criteria as a basis for selection of treatment as well as for care of the tympanostomy tubes.

Access the review questions and additional sources list online at http://www.expertconsult.com

Review Questions

1. ET opening is enhanced with all of the following, except

   a. Blowing through nose when nostrils are pinched (Valsalva maneuver)

   b. Yawning

   c. Swallowing

   d. **None of the above**

2. Indications for BDET include all of the following, except

   a. Development of effusion after extrusion of tubes

   b. Recurrent retraction pocket cholesteatoma

   c. **Otophonia**

   d. Recurrent barotrauma

3. For ETD, when indicated, all of the following procedures may be utilized, except

   a. BDET

   b. Adenoidectomy

   c. **Submucosal injection of filling material by the ET orifice**

   d. Z-plasty of levator veli palatine muscles if there is a submucous cleft

Congenital Malformations of the Middle Ear

David H. Chi

Keywords

aberrrant carotid artery; Aberrant facial nerve; Anomalies of the incus; anomalies of the malleus; anomalies of the stapes; Conductive hearing loss; high riding jugular bulb; ossicular chain reconstruction; Stapes Fixation

Introduction

Congenital anomalies of the ear are estimated to occur in 1 in 11,000 to 15,000 patients.[1] Isolated middle ear anomalies with a normal pinna and external ear canal account for a fraction of these anomalies, whereas approximately one-fourth of congenital middle ear anomalies are associated with syndromes.[2]

Congenital malformations of the middle ear are usually encountered in two situations. First, these may be suspected when a child has an unknown cause of conductive hearing loss not attributable to otitis media or trauma. The otoscopic examination or computed tomography (CT) scan may help to identify the malformation, and the findings are confirmed at the time of surgery.

The otologic surgeon may also encounter middle ear malformations incidentally during tympanoplasty or middle ear exploration for stapes surgery. Regardless, the surgeon has to be aware of the various potential anomalies and management options when these anomalies are encountered.

Key Operative Learning Points

1. Middle ear malformations should always remain in the differential diagnosis in children with conductive or mixed hearing loss.

2. An incidental encounter with a congenital middle ear malformation may occur during any otologic surgery.

3. A CT scan should be obtained in pediatric patients with conductive hearing loss not associated with otitis media.

4. Inner ear causes of conductive hearing loss such as superior semicircular canal dehiscence, large vestibular aqueduct, and large internal auditory canals should be evaluated prior to middle ear surgery.

5. The surgeon should be familiar with various reconstructive methods and verify their availability prior to surgery.

6. An aberrant facial nerve may be associated with anomalies of the middle ear, and the surgeon has to be vigilant to recognize this possibility to avoid injury.

Preoperative Period

History

1. History of present illness involves a comprehensive otologic history. For infants, the newborn hearing screen may help initially to identify congenital conductive hearing loss. For older children and adults, the duration of the hearing loss is important. Congenital hearing loss is suspected when hearing loss has been present since childhood.

2. Otologic history: otalgia, otorrhea, tinnitus, vertigo

3. History of prior otologic surgery

4. Family history of hearing loss and surgery to improve hearing

5. Social and developmental history: impact of hearing loss on speech and language development and performance in school

6. Review of systems may reveal ophthalmologic, cardiac, renal, or other medical problems suggestive of a syndromic diagnosis.

Physical Examination

1. Other craniofacial anomalies that may make congenital ear anomalies more likely

   a. Abnormalities of the pinna or preauricular skin tags or pits

   b. Branchial arch anomalies, such as defects of the mandibular arch (e.g., Treacher Collins syndrome). These findings also may predict difficulties in securing the airway during anesthesia.

2. The external auditory canal must be evaluated to determine adequacy for exposure and visualization during surgery.

3. The tympanic membrane should be examined for any apparent middle ear anomalies, such as vascular defects or anomalies of the malleus.

4. Tuning fork testing should be performed to establish consistency with audiologic testing.

Imaging

CT of the temporal bone is indicated when conductive hearing loss is present and not attributable to otitis media in a pediatric patient. Careful evaluation of the temporal bone may determine the etiology of the hearing loss. In addition, inner ear causes of conductive hearing loss may be identified. For example, semicircular canal dehiscence or dilatation of the internal auditory canal with X-linked gusher syndrome may result in nonsurgically reparable conductive hearing loss. Mutations in the gene encoding the POU3F4 transcription factor have been implicated in at least one form of X-linked progressive mixed hearing loss. Perilymph gusher may occur with opening of the footplate. This is thought to be secondary to patent cochlear aqueduct or a defect in the lateral end of the dilated internal auditory canal. Superior canal dehiscence syndrome and a large vestibular aqueduct may also be an inner ear cause of conductive hearing loss (Fig. 204.1). The conductive loss is thought to be secondary to the third window phenomenon. Surgery is not indicated in these cases.

CT images should be examined carefully for abnormalities of the ossicular chain and to assess for an aberrant course of the facial nerve.

Indications for Surgery

1. Middle ear exploration is indicated when a patient presents with conductive hearing loss without an identifiable etiology on physical examination or CT.

2. CT finding that may account for the hearing loss and is amenable to reconstruction

Contraindications

1. Medical comorbidities that will increase the risks of general anesthesia

2. Only hearing ear

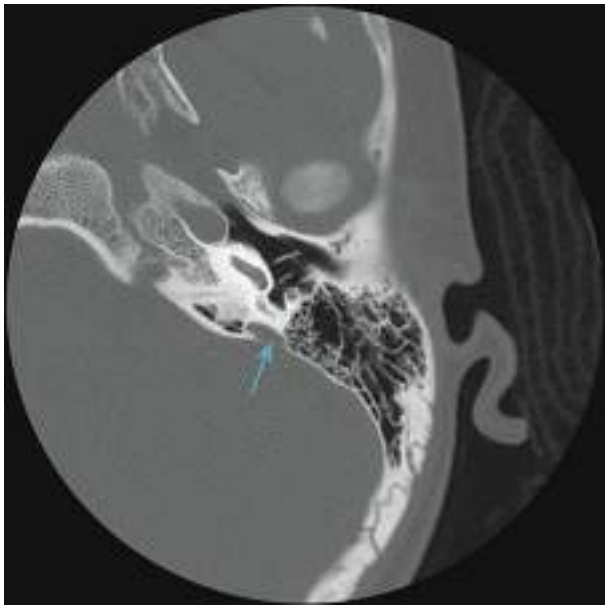

FIG. 204.1 Temporal bone computed tomography of a child with left conductive hearing loss and large vestibular aqueduct *(arrow)*. Interestingly, the sister also has large vestibular aqueducts and sensorineural hearing loss. No surgery is recommended for this patient.

3. Vascular anomaly that may not be surgically correctable or increases the risk of vascular trauma

4. Otitis-prone child

5. Inner ear causes for conductive or mixed hearing loss. Surgery may increase the risk of perilymphatic gusher.

Preoperative Preparation

1. Audiogram to determine baseline hearing. Testing may be challenging in a pediatric patient. Conductive hearing loss is common in children, secondary to otitis media. It is important to confirm that the air-bone gap closes after the middle ear aerates in these children to rule out congenital middle ear anomalies that are accounting for the hearing loss. Tympanometry should also be considered in children to help to confirm otoscopic findings.

Operative Period

Anesthesia

- Children require general anesthesia so that surgery can be performed comfortably and safely.
- In select adults, exploratory surgery may be done under local anesthesia with intravenous sedation. Benefits include less postoperative analgesia, quicker patient mobilization, reduced risk for aspiration, the ability to test hearing during surgery, and immediate feedback about potential vestibular injury.
- Long-acting paralytics should be avoided if facial electromyography (EMG). Monitoring is anticipated.

Positioning

The patient is placed in the supine position with the head turned so that the operative ear is facing toward the surgeon.

Preoperative Antibiotics

None necessary

Monitoring

Facial nerve monitoring with facial electromyography should be considered to assist when dissecting along the facial nerve or when facial nerve anomalies are suspected.

Instruments and Equipment to Have Available

1. Basic tympanoplasty/mastoidectomy set

2. Microscope or otoendoscope, per surgeon preference

3. CO_2 laser if middle ear adhesions or stapedectomy with laser is preferred

4. Drill, if severe bony overhangs or bony anomalies are encountered

5. Ossicular reconstruction prosthesis

Key Anatomic Landmarks

1. Malleus

2. Incus and stapes superstructure

3. Footplate of the stapes

4. Cochlear promontory and round window

5. Cochleariform process and horizontal position of the facial nerve

6. Aberrant vascular structures, such as high-riding jugular bulb, aberrant carotid artery, or persistent stapedial artery

Prerequisite Skills

1. Tympanoplasty

2. Ossciuloplasty

3. Stapedectomy

Operative Risks

1. Tympanic membrane perforation from the elevation of the tympanomeatal flap

2. Dysgeusia from injury to the chorda tympani nerve

3. No improvement or worsened hearing to the point of profound deafness

4. Balance disruption

5. Facial nerve injury resulting in facial paralysis

6. Vascular injury requiring further surgery or interventional radiology

7. Cerebrospinal fluid leak

Surgical Technique

Overview

The majority of the operative techniques used in addressing congenital middle ear malformations are similar to other tympanoplasty methods. Procedures for middle ear reconstruction after eradication of chronic middle ear disease are adaptable in addressing congenital middle ear anomalies. The surgeon may use various methods to correct conductive hearing loss. It is important that equipment and prosthesis are available in the operating room. Surgeon preference will determine whether autologous grafts (incus interposition graft, cartilage) or prosthetics (titanium, plastipore, hydroxyapatite, bone cement) are used. Appropriate drills and laser equipment should be available if necessary.

Regardless of the materials chosen, the basic principles for reconstruction of the middle ear conductive hearing apparatus include placement of the appropriately sized prosthesis in an adequately aerated middle ear. Accurate sizing and measurement takes patience and experience. Short prostheses may not adequately conduct sound and are prone to slippage. A long prosthesis is at risk for extrusion or potential

subluxation into the vestibule. Certain total or partial ossicular reconstruction prostheses (TORP or PORP, respectively) may require cartilage grafting to prevent extrusion.

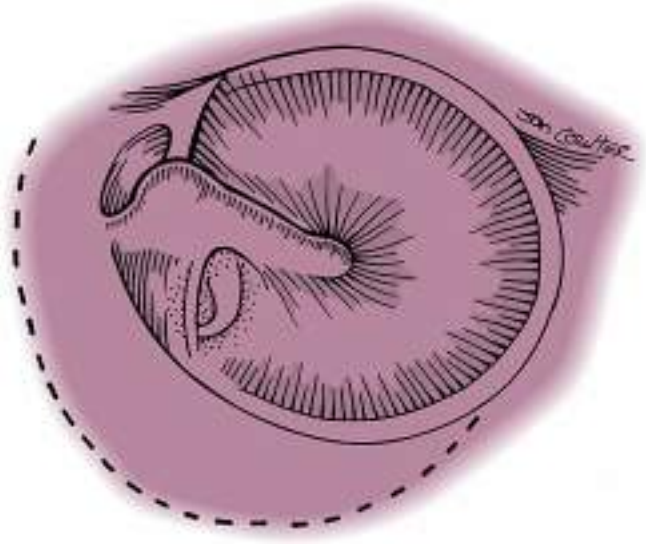

FIG. 204.2 Incision for tympanomeatal flap.

1. Surgery for middle ear anomalies begins with a four quadrant injection of local anesthetic in combination with epinephrine to minimize bleeding during elevation of the tympanomeatal flap.

2. The tympanomeatal flap is elevated to enter the middle ear space (Fig. 204.2). The flap should extend far enough superiorly to allow for removal of the scutum, if necessary. If a high-riding jugular bulb is present, care should be taken when entering the middle ear posteroinferiorly, as the jugular bulb may be entered during flap elevation.

3. Upon entering the middle ear, the landmarks are visualized and the ossicles are palpated to determine if any levels of fixation are present. The following techniques are related to the various abnormalities identified in the middle ear.

a. **Anomalies of the stapes.** Defects of the stapes are the most frequently encountered of all ossicular defects. However, the significance is based on the impact on hearing. Even defects such as a monopedal stapes are clinically unimportant unless hearing loss is present (Fig. 204.3A). The shape of the crura and obturator foramen needs to be assessed (see Fig. 204.3B). Mobility of the superstructure

and footplate along with its attachment to the incus is determined.

1) Bony bridges may attach the superstructure to the promontory (see Fig. 204.3C). These bridges may be separated by fracturing or dividing them with CO_2 laser.

2) The stapes structure may not be in contact with the footplate (see Fig. 204.3D). The arch defect is detached from the incus. Reconstruction may occur with an ossicular reconstruction prostheses or stapes prosthesis based on the status of the remaining ossicles and mobility of the footplate.

3) Congenital footplate fixation. This finding develops as a blending of the bone of the footplate with the surrounding otic capsule and the absence of a visible annular ligament (see Fig. 204.3E). The fixed stapes is often deformed. Surgical results for stapes fixation in the setting of isolated fixation are quite good. However, the outcomes are diminished in the presence of associated abnormalities of the incudomalleolar complex. The lower outcome is thought to be secondary to decreased stability of the reconstruction when the prosthesis extends to the malleus or to the tympanic membrane. On occasion, the footplate is thickened and may require a drillout. This is performed in a fashion similar to that used for obliterative otosclerosis. The oval window is gradually saucerized with a microdrill until the footplate is bluelined. Fenestration of the footplate is performed in the usual manner, followed by placement of the stapes prosthesis.

4) Footplate defects are rare findings associated with inner ear anomalies (Fig. 204.4). Clinically, children may present with recurrent meningitis or CSF otorrhea or rhinorrhea. Treatment usually involves exploration of the middle ear, removal of the remnant footplate, and obliteration of the opening with soft tissue.

b. **Anomalies of the incus**

1) The most common defect of the incus is hypoplasia of the long or lenticular process resulting in a fibrous incudostapedial joint (Fig. 204.5). This finding is similar to the incus erosion that occurs with chronic otitis media and tympanic membrane

retraction. Surgical options for this malformation include bone cement to reattach the incus to the stapes. Other alternatives include incus interposition graft or PORP.

2) The incudomalleal joint fusion is a common finding in aural atresia but may also occur in isolation (Fig. 204.6). Bony attachments may occur within the attic or to the manubrium. Bony attachments to the malleus may require separation with a malleus nipper or with CO_2 laser. Fixation in the epitympanum may be addressed with mobilization, but this has been associated with risk of refixation. Alternatively, the incudostapedial joint may be separated, and the incus interposition graft or PORP may be used.

c. **Anomalies of the malleus.** Anomalies of the malleus are uncommon.

1) Complete absence of the malleus has been described only in the presence of multiple abnormalities.

2) Absence or discontinuity of the manubrium from the neck and head has been reported (Fig. 204.7). This defect may be addressed with disarticulation of the incudostapedial joint and placing a PORP onto the stapes.

3) Separation of the malleus from the tympanic membrane. This defect may be addressed with tympanoplasty grafting medial to the malleus. Alternatively, the PORP may be placed from the stapes to the tympanic membrane.

4) Fixation of the malleus may also occur to create a conductive hearing loss. Bony or fibrous attachments may occur at the scutum. The malleus may also be fused to the incus. Initial attempts at mere division have resulted in refixation and recurrence of the hearing loss. Thus division of the incudostapedial joint is recommended, followed by separation of the manubrium from the head of the malleus. This is followed by PORP placement or incus interposition graft.

d. **Anomalies of the facial nerve**

1) The surgeon must be familiar with the anatomy of the facial nerve and the most common aberrant course.

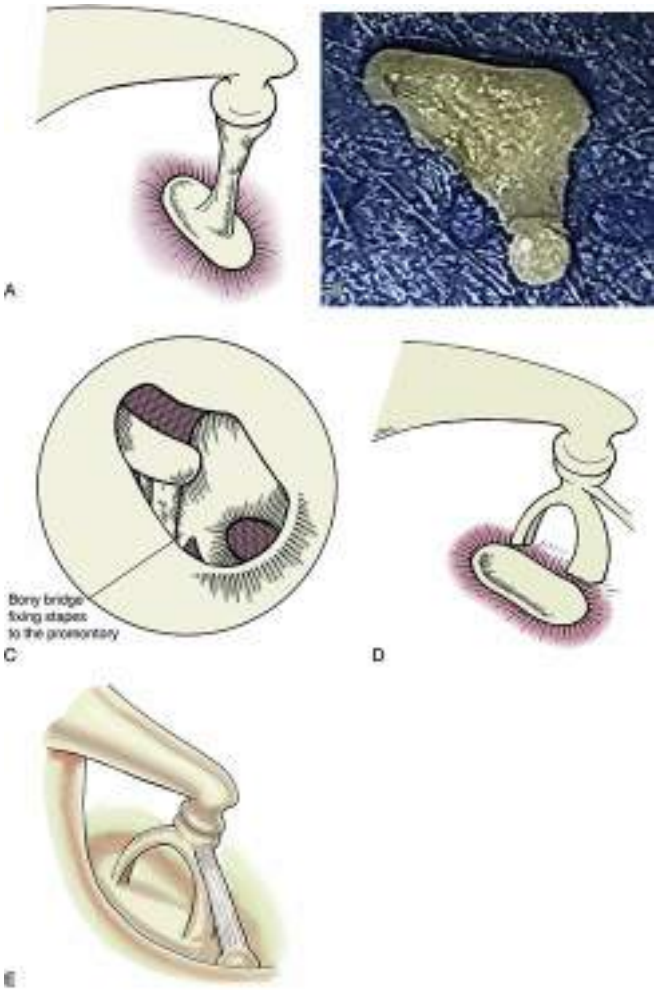

FIG. 204.3 **A,** Monopedal stapes superstructure. **B,** Stapes of patient with fused crura and a malformed footplate. **C,** Bony attachment from promontory to stapes. **D,** Congenital discontinuity of the stapes superstructure to the footplate. **E,** Congenital footplate fixation with absence of the annular ligament.

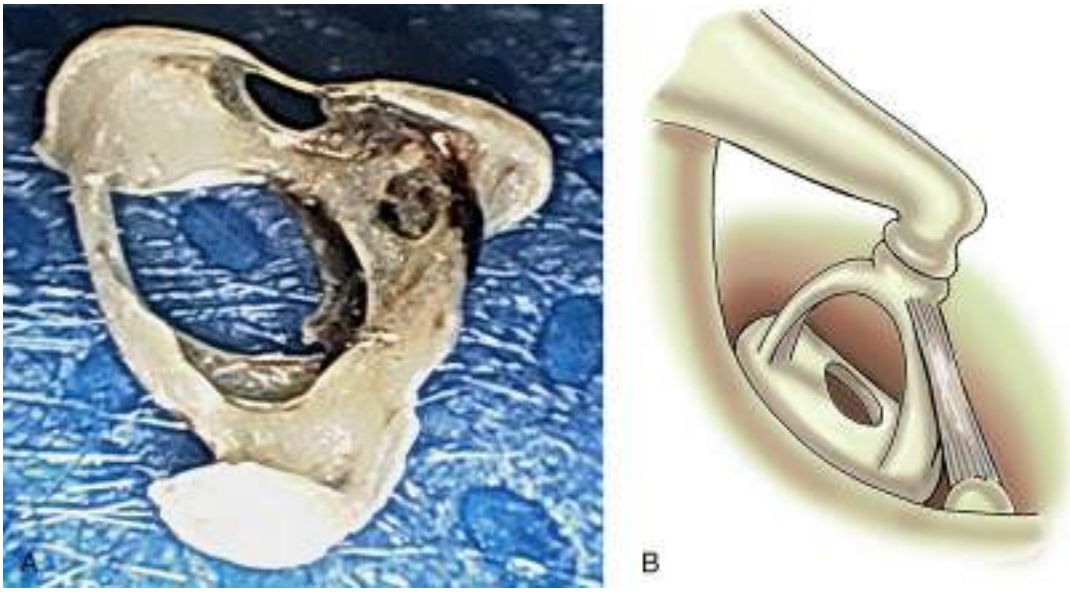

FIG. 204.4 Stapes of a child with cerebrospinal fluid rhinorrhea and a defect in the footplate.

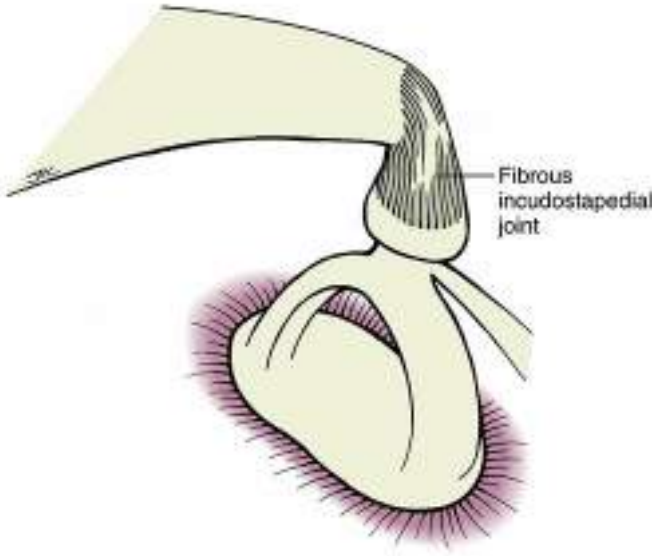

FIG. 204.5 Fibrous incudostapedial joint.

2) Dehiscence of the horizontal facial nerve is very common and may be considered a normal variant. The surgeon has to recognize this finding and avoid trauma to this area.

3) Prominent overhang of the facial nerve may make access to the oval window more challenging when a prosthesis is necessary. Gentle retraction of the nerve may allow for access to the oval

window. A stapes prosthesis may be placed in close contact to the nerve and may even make an indentation in the epineurium.

4) The facial nerve may subdivide into several branches and may not even be within a bony fallopian canal. The nerve may course over the oval window, preventing access to the footplate (Fig. 204.8). In these cases, surgery should be abandoned. On occasion the vertical portion of the facial nerve is displaced anteriorly and traverses across the hypotympanum.

e. **Vascular anomalies**

1) Aberrant carotid artery may be seen coursing through the middle ear and appears on CT as a soft tissue mass along the promontory that enters the horizontal carotid canal through a dehiscence in the lateral carotid plate (Fig. 204.9A). This finding is not amenable to surgical therapy. The danger is mistakenly considering that the mass represents a glomus tumor. Puncture or biopsy may lead to significant hemorrhage and potential neurologic sequelae.

2) High-riding jugular bulb. The jugular bulb is defined as being high riding when the most cephalad portion reaches superiorly to the level of the floor of the external auditory canal. Occasionally, a diverticulum of the bulb may reach even farther cephalad (see Fig. 204.9B). The high-riding jugular bulb is usually asymptomatic and does not require intervention. Occasionally, it reaches superior enough that symptoms may arise including pulsatile tinnitus and conductive hearing loss. If symptoms are present, the bulb may be skeletonized and displaced inferior to the round window by a cartilage or cortical bone graft.

3) Persistent stapedial artery. Small remnants of the artery usually present no problem, and the small amount of bleeding will cease. Large remnants (Fig. 204.10) of the stapedial artery require careful attention. Access to the footplate is possible by working anterior or posterior to the vessel.

f. **Anomalies of the round window.** Congenital absence of the round window is a rare finding. As the otic capsule ossifies during development, a cartilaginous ring prevents bone depositions at the

site of the round window. Improper formation of this cartilaginous ring is thought to result in an absent round window. Fenestration of the promontory to create a round window is not advised because of the significant risk of sensorineural hearing loss.

Common Errors in Technique

1. Limited visualization of the middle ear secondary to inadequate exposure from the tympanomeatal flap

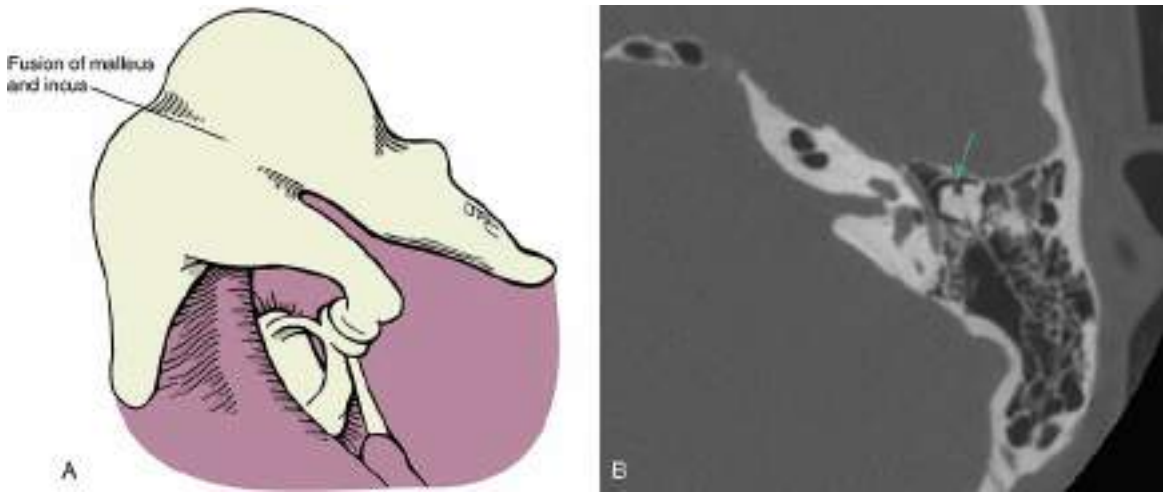

FIG. 204.6 **A,** Fused malleus and incus. **B,** Computed tomography of fused malleus and incus *(arrow)*.

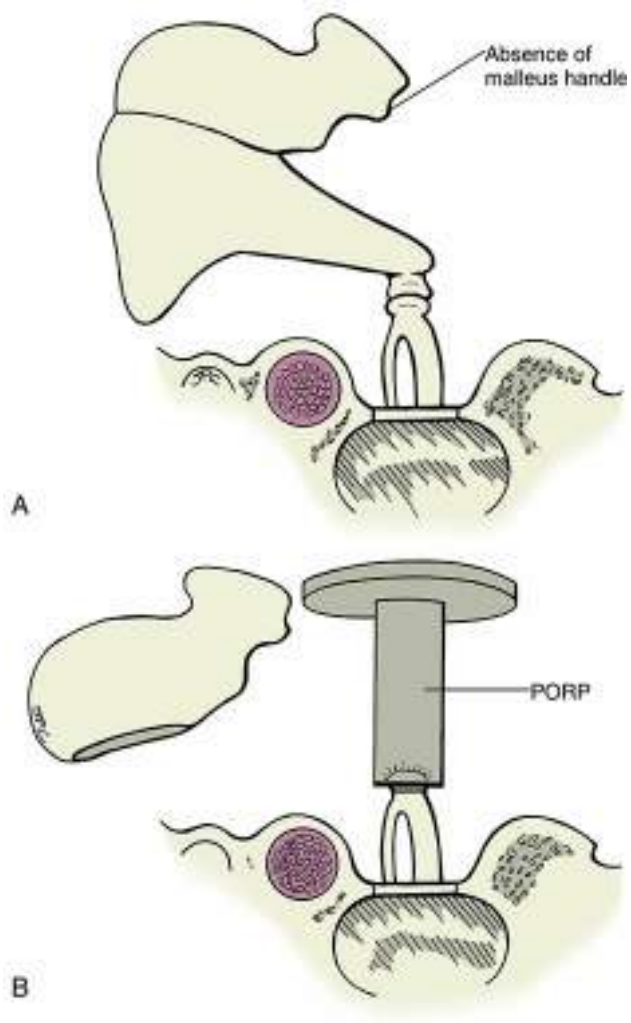

FIG. 204.7 **A,** Absent manubrium. **B,** Repair with a partial ossicular reconstruction prosthesis.

2. Inadequate assessment of the mobility of the ossicular chain

3. Inadequate fitting of the ossicular prosthesis

Postoperative Period

Postoperative Management

1. Ear dressing is left on for 2 to 3 days.

2. Limited activities for 4 weeks

3. No water exposure to the ear canal for 4 weeks. May use ear plug or cotton ball coated with Vaseline petroleum jelly or antibiotic ointment in

the ear canal starting 3 days after surgery

4. When a perilymph gusher is encountered, the head is maintained at an elevation of at least 30 degrees. Stool softeners are ordered to minimize Valsalva maneuvers. If drainage persists, a lumbar drain may be required.

Immediate Complications

1. Facial nerve injury. Temporary facial paralysis may occur from diffusion of local anesthetic toward the stylomastoid foramen. A brief period of observation will soon identify these cases. Delayed onset of facial paralysis is followed expectantly because this finding is thought to be from edema of the facial nerve. When complete paralysis is immediate and without explanation, re-exploration may be necessary to rule out disruption of the facial nerve.

2. Deafness. In the immediate postoperative period, hearing loss may be evaluated with a tuning fork. Conductive hearing loss is expected because of packing in the canal and effusion in the middle ear.

3. Perilymphatic gusher. Excessive flow of perilymph after opening into the vestibule is more common with congenital footplate fixation than otosclerosis. When encountered, the head of bed should be elevated. The surgeon should avoid suctioning the vestibule. A fascia graft should be placed over the defect. An intraoperative lumbar drain may be considered if conservative measures fail to resolve the leak. The preoperative CT scan should be reviewed to identify any inner ear malformations that may have accounted for the gusher.

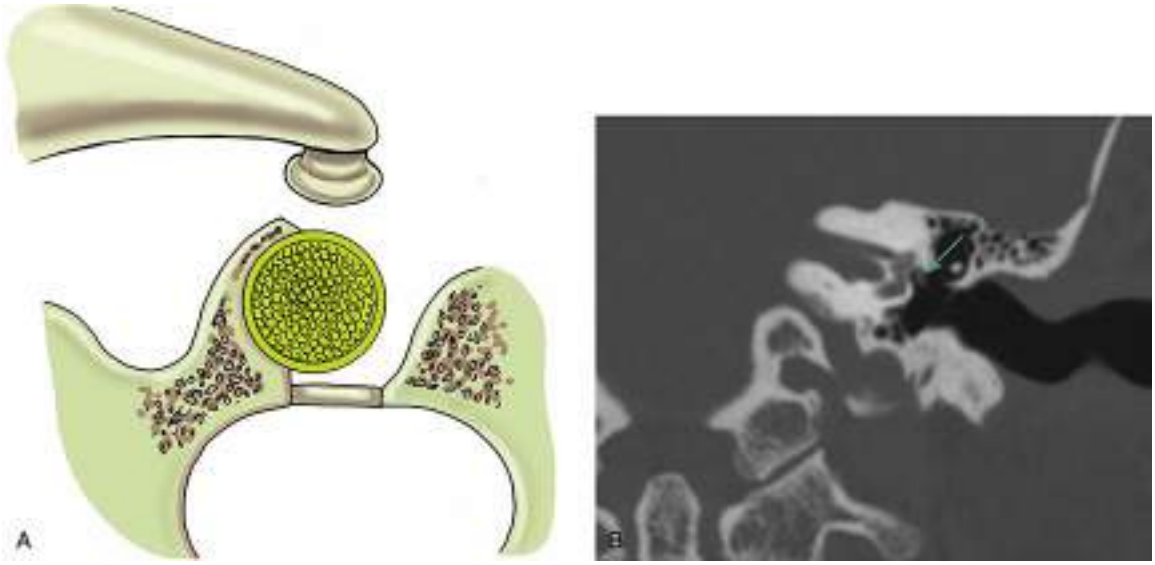

FIG. 204.8 **A,** Facial nerve coursing over the footplate. **B,** Computed tomography of facial nerve *(arrow)* over oval window.

4. Vertigo. Mild vertigo may occur with any otologic surgery but is more common in cases that involve opening the oval window. Severe vertigo suggests a potentially serious problem. Fistula, subluxation of the footplate, and long prosthesis extending into the vestibule are part of the differential diagnosis. Sensorineural hearing loss can occur with this finding. Surgical exploration should be considered if these causes are suspected.

5. Tympanic perforation. Fascia grafting may be necessary if a significant tear is recognized intraoperatively.

6. Vascular injury. Bleeding secondary to injury to the jugular bulb will typically stop with packing the middle ear with Surgicel. Injury to the carotid artery may be catastrophic. The ear should be packed and interventional radiology should be consulted urgently. Type and cross of blood should be obtained immediately.

Long-Term Complications

1. Conductive hearing loss

The prosthesis may become displaced, resulting in ossicular discontinuity and loss of hearing. When using a prosthesis that is in

contact with the tympanic membrane with or without cartilage, extrusion may occur resulting in conductive hearing loss.

2. Cholesteatoma

May occur from the epithelial trapping during healing of the tympanomeatal flap

Alternative Management Plan

1. Hearing aids are an option for those who are not candidates for surgery.

2. Observation for those with minimal hearing impairment or those who do not desire intervention

Discussion

Evidence-Based Medicine Question

How are the surgical outcomes for congenital footplate fixation (CFF) compared with juvenile otosclerosis (JO)?

Stapes surgery in children is uncommon compared with stapedectomy for otosclerosis in adults. Controversy remains regarding stapedectomy in pediatric patients because hearing aids provide good rehabilitation, and some surgeons prefer that a child be old enough to participate in the decision-making process. JO usually presents later with progressive, low-frequency hearing loss, whereas CFF typically presents earlier with greater hearing loss.[3] Family history of otosclerosis is usually present in 53% of JO cases and only 9.8% of CFF cases.[4] The majority of cases demonstrate that CFF is the etiology of the conductive hearing loss compared with JO.[5]

A meta-analysis of surgical outcomes for juvenile otosclerosis versus congenital footplate fixation showed the air-bone gap was less than 10 dB in 80.2% of cases in JO and 54% for CFF. Combined, the overall success rate is 69.9%.[6] Unfortunately, the differentiation of the two causes is at the time of middle ear exploration.

Editorial Comment

With the advances in cochlear implant technology for pediatric patients, the management of pediatric sensorineural hearing loss has been revolutionized. Medical literature and outcomes research support cochlear implants as the accepted standard of care for children with severe to profound sensorineural hearing loss who do not benefit with hearing aids alone.

In contrast, the treatment of conductive hearing loss due to congenital middle ear anomalies has received comparatively little attention. Surgical techniques have been refined, but controversies in the timing of intervention and in the specific approaches to treatment of these relatively uncommon anomalies persist.

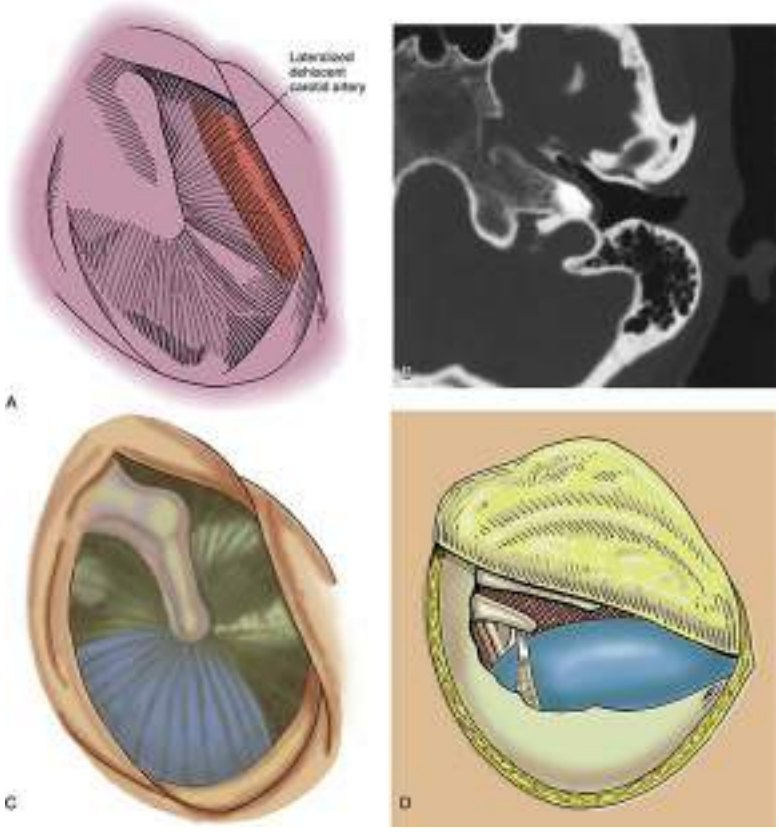

FIG. 204.9 **A,** Aberrant carotid artery as seen through tympanic membrane. **B,** Computed tomography of aberrant carotid artery. **C,** High-riding jugular bulb as seen through tympanic membrane. **D,** High-riding jugular

bulb abutting the stapes superstructure.

The author of this chapter has ably and concisely summarized the current guidelines and has highlighted areas of persistent controversy and uncertainty. The reader is reminded that middle ear anomalies may be seen in children with conductive hearing loss, with or without active middle ear disease, and also that middle ear anomalies may be encountered incidentally during middle ear surgery for reasons such as tympanoplasty.

CT scan of the temporal bone is recommended when conductive hearing loss is present in the absence of middle ear disease. Rare inner ear causes of conductive hearing loss will be seen occasionally, which will impact the decision for surgery, as may vascular anomalies or abnormalities of the facial nerve.

Malformations of the middle ear are uncommon, a wide variety of autologous grafts and prostheses are available, surgical techniques differ from one surgeon to another, and the congenital anomalies are not all of one type. For these and other reasons, outcomes are not well established, and consensus on the timing and nature of surgical intervention has not been reached. Advances in surgical technique, technology for amplification, and clinical outcome measurement together hold the promise for a better understanding of the optimal treatment for children with conductive hearing loss due to congenital malformations of the inner ear.

Ellis M. Arjmand

Review Questions

1. Which ossicle(s) is/are associated with highest proportion of congenital

anomalies?

a. Malleus

b. Incus

c. **Stapes**

d. Fused malleus incus

2. Which statement about stapes surgery in children is CORRECT?

a. The most common indication is juvenile otosclerosis.

b. Hearing outcomes are similar for otosclerosis and congenital footplate fixation.

c. Aberrant course of the facial nerve is rare in congenital footplate fixation.

d. **Hearing outcomes are better for congenital footplate fixation when other ossicular anomalies are absent.**

3. Which of the following is NOT an appropriate option for malleoincudal fixation?

a. Incus interposition graft

b. **Stapedectomy**

c. Partial ossicular reconstruction prosthesis

d. Total ossicular reconstruction prosthesis

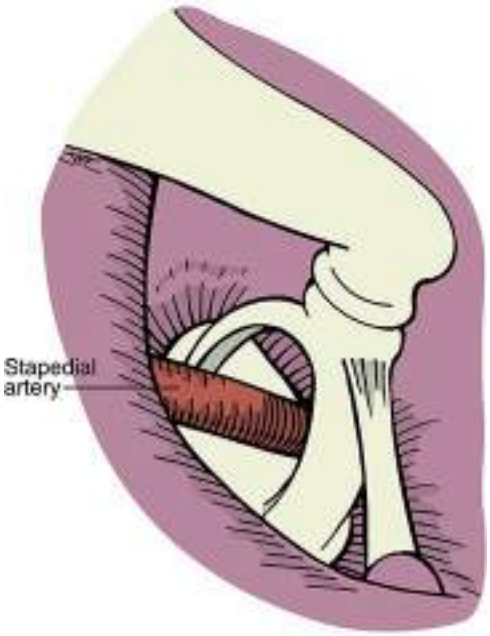

FIG. 204.10 Persistent stapedial artery.

Pediatric Cochlear Implantation

Michael S. Cohen, and David H. Chi

Introduction

The cochlear implant (CI) is unique among medical devices in that it serves as a neurosensory prosthesis capable of restoring or providing de novo the sense of hearing to its users. As technology advances with hardware, sound processing algorithms, and mapping strategies, CI users have achieved ever more impressive outcomes in both hearing and speech development. Many children born with severe to profound hearing loss today will go on to participate in mainstream curricula with the help of CIs. The US food and drug administration (FDA) has approved the use of CIs in children at least 1 year of age, and in certain cases, surgeons will implant children off-label at substantially younger ages. With careful patient selection, attention to surgical technique, and comprehensive postoperative rehabilitation, the CI is an extremely viable option for restoring hearing in children with severe to profound hearing loss.

Key Operative Learning Points

- Careful patient selection is the key to achieving optimal hearing and speech outcomes
- Use of intraoperative facial nerve monitoring is recommended
- Review of imaging prior to surgery is critical to anticipate anatomic variants, such as:
  - High-riding jugular bulb
  - Low-hanging dura

    - Narrow facial recess width
    - Bifid or dehiscent facial nerve
    - Stenotic round window niche
    - Cochleo-vestibular abnormalities, including enlarged vestibular aqueduct
- Be sure to calculate an appropriate weight-based volume of local anesthetic prior to injection. In very young children, the maximum allowable volume is often less than 10 cc of 1% lidocaine.
- To increase symmetry for bilateral simultaneous implantation, use metal templates to determine optimal location for incisions and for subperiosteal pocket development.
- Hemostasis at each step is critical, especially in very young children. Allow adequate time for vasoconstrictor effect, have bipolar cautery available (especially for the second side on bilateral surgery), use bone wax for unpneumatized diploic bone during mastoidectomy.
- Fixation can be achieved with a traditional well, with stay sutures, or with a tight subperiosteal pocket. Be prepared to use any of the above options if needed to ensure the secure positioning of the receiver stimulator.
- Device manufacturer and electrode choice will depend upon patient preference, anatomic considerations, and surgeon/implant program experience and routine. Be familiar with the device electrode to be implanted as there are subtle but critically significant differences among them.
- Soft surgery techniques can optimize outcomes not only by preserving residual hearing, but by preserving spiral ganglion neurons. These may include:
    - Use of systemic and/or topical steroids intraoperatively
    - Use a slow drill speed when drilling on the otic capsule
    - Slow electrode insertion to minimize intracochlear pressure during insertion
    - Choice of anterioinferior cochleostomy site confluent with round window or use of the round window approach to ensure scala

tympani insertion

- Plugging of the cochleostomy (if performed) is usually accomplished with temporalis fascia or muscle. In bilateral simultaneous cases, harvest enough tissue for both cochleostomies from the first side to eliminate a second step and reduce the potential for bleeding from the contralateral side, particularly when electrocautery can no longer be used.
- Layered closure using absorbable suture.
- A tight mastoid dressing should be left in place for 48 hours. This can be replaced with a Glasscock dressing by the family, to be used during sleep for comfort, or if the child is manipulating the incision.
- Activation is typically performed 3 to 4 weeks postoperatively.

Preoperative Period

Extensive preparation is necessary prior to embarking upon CI in a child. It is critical to use a multidisciplinary approach for patient selection and preparation of the family and patient for surgery. While the surgery itself takes only a few hours, successful CI use requires months to years of intense therapy, continued device maintenance, and enrollment in an appropriate academic setting that will support the development of speech and language using electronic hearing. Patients should be evaluated by a CI program with experience implanting and habilitating children with hearing loss. Evaluation by Otolaryngology, Audiology, and Speech and Language Pathology are essential to determine candidacy for implantation. Collaboration with other specialties including genetics, social work, developmental pediatrics, neurology, and neuropsychology can help to predict postoperative rehabilitation challenges and set appropriate expectations for performance.

For children with congenital deafness, better speech and hearing outcomes are correlated with earlier age at implantation.[1] The FDA has approved cochlear implantation for children with bilateral severe-to-profound cochlear implantation at 1 year of age or older. Off-label implantation at a younger age is frequently considered, particularly in conditions such as post-meningitic hearing loss, where progressive labyrinthitis ossificans can obliterate the cochlear duct, preventing

successful electrode insertion. Children as young as 3 months of age have been successfully implanted.[2]

It is difficult to overstress the importance of establishing a relationship between the family and the entire implant team. Educating families regarding the implant process, especially with regard to the necessary postoperative therapy required for successful use of the device, is critical in preventing implant failure in the form of non-use. While CI technology is certainly one of the more miraculous developments in modern medicine, it is by no means a cure-all, and success requires much more than good surgical technique. Partnering with families in advance to reach this understanding will make the habilitation process a much more positive experience for all parties involved. For families with a language barrier, limited socioeconomic support, or other comorbid medical conditions requiring frequent appointments, the process is often felt to be overwhelming. It can be helpful to involve social work to facilitate transportation, parking, and coordination of multiple appointments. Often, helpful insight can be obtained from teachers, audiologists, and speech pathologists from the child's school, early childhood program, or early intervention service. Obtaining releases from the parents so providers can discuss cases with these individuals can lead to greater understanding of the needs of the patients and their families. Often creative solutions to problems can be reached in this manner.

Many cases require complex decision making regarding whether the patient will experience overall benefit from a CI. In pre-lingually deafened individuals, neural plasticity decreases over time, limiting the potential benefit of CIs in a time-dependent manner. Still, every case varies and any given child can have results, which exceed expectations. This is an especially important conversation to have with pre-lingually deafened teenagers who come seeking CIs. It is most important to ask what the patient's expectations are in this situation; that is, why do they want an implant? Sound awareness for safety and speech pattern perception to augment and support lip-reading are reasonable expectations in such cases, whereas use of the telephone and development of typical speech are unreasonable expectations.

History

1. History of present illness
    a. Duration and onset of hearing loss
    b. Modality of diagnosis
    c. Etiology of hearing loss, if known
    d. Associated symptoms (if not congenital, e.g., fever, tinnitus, vertigo)
    e. Prior evaluation (diagnostic testing, imaging)
2. Prenatal history
    a. Prenatal ultrasound findings
    b. Maternal screening
    c. Maternal infection
    d. Maternal diabetes
3. Perinatal history
    a. Prolonged labor
    b. Hypoxia
    c. Neonatal intensive care unit (NICU) or special care nursery admission
    d. Intubation/mechanical ventilation
    e. Hyperbilirubinemia
    f. Antibiotic use
    g. Diuretic use
    h. Cytomegalovirus (CMV) infection
4. Other medical history
5. Medications
6. Allergies
7. Vaccination history
    a. Children with hearing loss and children with CIs are at a higher risk for meningitis than the general population.
    b. The Advisory Committee on Immunization Practices of the Centers

for Disease Control offers specific guidelines for vaccination of CI recipients (CDC Website link, 2016 https://www.cdc.gov/vaccines/vpd/mening/hcp/dis-cochlear-gen.html)

8. Developmental history
    a. Evaluation by a developmental pediatrician or neuropsychologist to assess for hearing-related and non-hearing-related developmental delays
9. Family history
10. Interventions and social support
    a. Early intervention
    b. Speech therapy
    c. Hearing aid trial/use
    d. Early childhood hearing loss programs
    e. 504 plan or individualized education plan (IEP)
    f. Family understanding and acceptance of diagnosis

Physical Examination

1. General appearance
    a. Level of alertness and interaction with examiner
    b. Dysmorphism/syndromic features
2. Skin
    a. Jaundice
    b. Café au lait spots
3. Head
    a. Microcephaly/macrocephaly
    b. Hair color/white forelock
4. Eyes
    a. Conjugate gaze (if age appropriate)

b. Heterochromia

c. Dystopia canthorum

d. Coloboma

5. Ears

a. Auricular abnormalities

b. Microtia

c. Pits/tags

d. Middle ear status

6. Nose

a. Shape

7. Patency throat

a. Cleft palate

8. Neck

a. Pits, cysts, masses

9. Extremities

a. Syndactyly/webbing

Imaging

1. High resolution computed tomography (CT) scan of the temporal bones

a. Axial and coronal view to evaluate the cochlear anatomy and identify cochleovestibular abnormalities

b. Assess bony anatomy for surgical approach

1) Low-hanging dura

2) Anterior sigmoid sinus

3) High-riding jugular bulb

4) Width and density of facial recess

5) Anatomy of round window

c. Narrow internal auditory canal (IAC) or cochlear aperture stenosis may suggest cochlear nerve deficiency

d. Presence of enlarged vestibular aqueduct associated with a higher risk of perilymph gusher

2. Magnetic resonance imaging (MRI) of the temporal bones

a. Determine the presence of the cochlear nerve

b. Assess for cochlear ossification, particularly in cases of hearing loss secondary to meningitis

3. Imaging decision making

a. MRI and CT are complementary studies, with MRI more precise in determining surgical candidacy and CT more useful for technical planning of surgery.

b. While it is preferable to have both studies, either study is acceptable; the presence abnormal anatomic findings may justify the second study for further delineation of the anatomy.

c. The risks of each study should be discussed with the family, with CT resulting in radiation exposure and MRI often requiring sedation or anesthesia.

Indications

- Bilateral severe-to-profound sensorineural hearing loss
- Unilateral severe-to-profound sensorineural hearing loss with contralateral progressive hearing loss or at-risk ear (e.g., with enlarged vestibular aqueduct)
- Indications for cochlear implantation in other hearing loss configurations continue to evolve, such as unilateral severe-to-profound loss with stable contralateral hearing, or normal low frequency hearing with mid-high frequency severe to profound loss

Contraindications

1. Patient factors

a. Medically unstable for the procedure

2. Family factors

a. Unable to reliably attend mandatory postoperative rehabilitative therapy sessions

b. Significant family disagreement/dissent regarding diagnosis or surgical plan

3. Anatomic factors

a. Absent cochlea

b. Absent cochlear nerve

c. Severe cochleovestibular abnormalities (relative, consider auditory brainstem implant)

d. Cochlear nerve deficiency (relative, consider auditory brainstem implant)

Preoperative Preparation

1. Decision by implant team to offer CI

2. Informed consent from family, including understanding of reasonable postoperative expectations for hearing and speech, and required commitment for ongoing therapy

3. Up-to-date vaccination status, specifically with age-appropriate pneumococcal vaccination

Operative Period

Anesthesia

- No long-acting paralytics due to active monitoring of the facial nerve
- Active communication regarding dosing of local anesthetic use particularly for very young children
- The anesthesia machine is positioned at the foot of the table to create space for the microscope and to switch sides for bilateral simultaneous

CI surgery

Positioning

- The patient is kept supine with the head turned approximately 45 degrees away from the surgeon.
- In bilateral simultaneous cases, facial nerve monitoring leads may be placed bilaterally at the start of the case, draping wires in the midline over the forehead, and protecting the skin with a 4 × 4 gauze or sponge

Perioperative Antibiotic Prophylaxis

- Antibiotics are administered during induction of anesthesia and continued for 7 days postoperatively
- Choices
  - Amoxicillin-clavulanate
  - Cephalosporin
  - Clindamycin

Monitoring

- Routine anesthesia monitoring
- Facial nerve monitoring
- Consider intraoperative neural response testing following electrode insertion

Instruments and Equipment to Have Available

  - Post-auricular device template and receiver stimulator templates should be available for non-sterile use for planning incision and subperiosteal pocket location
- Mastoidectomy

- Otologic surgery set
- High speed otologic drill
- Protected or angled 1.5 and 1 mm diamond burs can be helpful for completing facial recess and drilling down round window overhang in young children
- Craniofacial screws for securing tie-down sutures

- Device insertion
  - Manufacturer-specific device insertion instruments
    - Advance-off-stylet forceps
    - Jeweler's forceps
    - Claw tool
  - 0.3 mm Stapes rasp

Key Anatomic Landmarks

- Mastoid:
  - See mastoidectomy chapter (Chapter 134) for details of mastoidectomy
  - Special consideration must be made to limit bleeding during mastoidectomy, especially in very young children. Bone wax may be used for hemostasis in non-pneumatized marrow containing bone.
  - The facial nerve exit via the stylomastoid foramen is more superficial in young children. Care must be taken to limit the inferior extent of the skin incision to avoid injury to the facial nerve
  - Complete saucerization of the mastoid tip is critical to admit enough light through the facial recess and to allow access to instruments at the appropriate angle for electrode insertion.
- Facial recess:
  - See mastoidectomy chapter (Chapter 134) for details of facial recess dissection
  - In pediatric cochlear implantation, bone removal at the inferior apex of the facial recess is critical for adequate visualization of the round

window

- Cochleostomy:
  - Round window overhang

    Variable in extent

    Typically must be drilled away to expose round window membrane
  - Round window membrane

    Pseudomembrane may be present, and may be lysed with Rosen needle or small right angle hook
  - Relationship to stapes footplate/oval window

    Round window will be no more than 2 mm inferior to oval window

    Use a 2 mm round knife to measure, if necessary
  - Appearance of subcochlear tunnel

    Air cell tract appearing adjacent to anterior pillar of round window niche

    Can be mistaken for round window
  - Anatomy of direction of cochlear turns

    Direction of basal turn at the level of round window points toward the top of the head

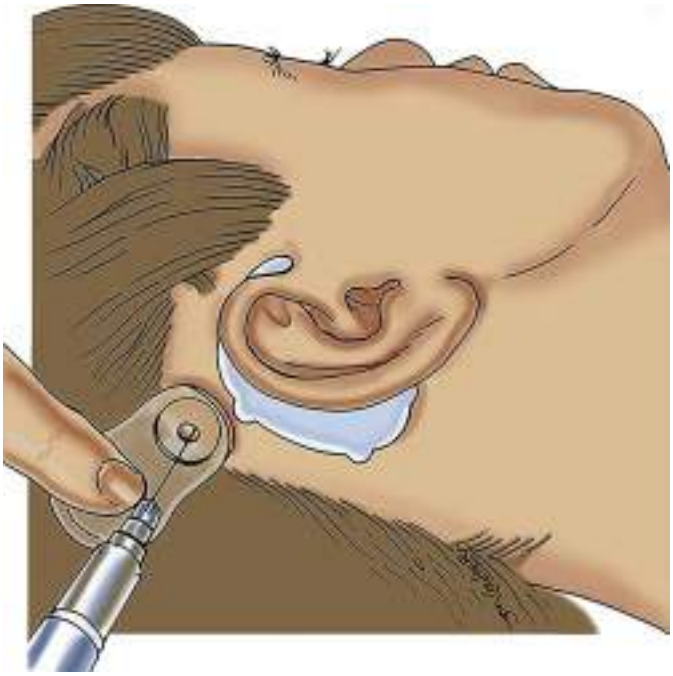

FIG. 205.1 Marking the location of the well with template and methylene blue.

Prerequisite Skills

- Mastoidectomy
- Facial recess: standard and extended
- Extensive knowledge of middle and inner ear anatomy, particularly in cases of middle or inner ear abnormalities

Surgical Technique

- Surgical planning
  - Post-auricular scalp is shaved
  - Anticipated skin incision is demarcated
  - Templates are used to demarcate the location of the receiver-stimulator and the behind the ear processor. Methylene blue in a 3 cc syringe with a 27 gauge needle may be used to mark the cortical bone (Fig. 205.1). The implant needs to be placed sufficiently posterior so that it does not abut the processor.

Be consistent with the method of marking so the location of the implant is as symmetric as possible when bilateral implants are performed

The orientation of the implant should be at least 45 degrees from horizontal. In infants, the implant is oriented in even more of a vertical orientation so that the posterior limit of the implant does not overly the occiput

- Soft tissue preparation
  - Skin incision down to level of temporalis fascia
  - Extended anteriorly based subperiosteal flap is created encompassing the location of the well.
  - Subperiosteal pocket is created to accommodate the receiver-stimulator. A dummy silastic or metallic template is used to confirm adequacy of the pocket (Fig. 205.2).
  - A small subtemporalis pocket is made for the ground electrode if present on the CI
  - Temporalis fascia and muscle is harvested and set aside for packing of the cochleostomy.

    If bilateral simultaneous implants are planned, harvest additional fascia and muscle for the contralateral side.

FIG. 205.2 Confirming the adequacy of the subpericranial pocket with a template.

- Mastoidectomy
  - A simple mastoidectomy is performed while identifying common landmarks of the tegmen, the posterior external canal wall, the horizontal semicircular canal, and the short process of the incus.

    Posterior canal wall must be thinned to the level of translucence for adequate visualization of the facial recess

    In a contracted mastoid or when sigmoid sinus is anterior, the scroll region of the posterior canal wall may need to be lowered slightly to allow an adequate view into the facial recess
- Facial recess
  - The facial recess is opened with the landmarks (Fig. 205.3A and B)

    Short process of the incus pointing to the recess

    Incudal buttress: superior border

    Vertical facial nerve: posterior/medial border

    Chorda tympani nerve: anterior/lateral border

    Full dissection of the facial recess is a critical step for successful identification of and access to the round window niche and membrane
  - The middle ear is identified

    Stapedial tendon and incudostapedial joint

    Round window niche
- Preparation of the round window
  - The mucosa of the promontory around the round window may be pre-emptively removed to minimize bleeding; gelfoam with epinephrine may be applied topically for vasoconstriction
  - The round window overhang is removed to identify the round window using a 1 mm or 1.5 mm diamond bur (Fig. 205.4A and B)
  - Drill speed is lowered when removing otic capsule bone
- Preparation of the well
  - A template is used to demarcate the size of the well

- Per surgeon preference, a well may be drilled to lower the profile of the device

  In infants and young children, limited calvarial thickness may require dural exposure to create adequate depth for the receiver stimulator

  Care must be made not to violate dura

  Tie down holes with sutures may be used. Tying 3-0 silk or nylon suture around the heads of 3 mm craniofacial plating screws may be used as an alternative to drilling holes for tie down sutures (Fig. 205.5). An alternative technique is a tight periosteal pocket to avoid tie down holes or screws

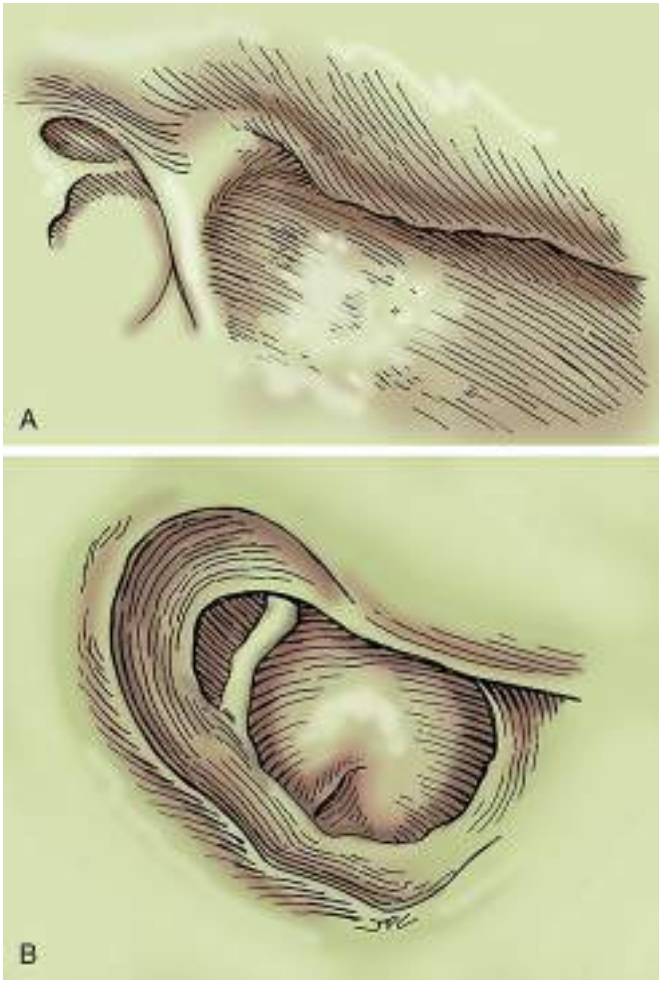

FIG. 205.3 **A,** Facial recess prior to opening. **B,** Facial recess after opening.

- Trough is made from the well to the mastoid cavity for the electrodes

- Cochleostomy and electrode insertion
  - Wound is copiously irrigated to clear bone dust
  - Implant is placed in the subperiosteal pocket and seated within the well. The electrode is gently draped posteriorly and rested on a clean, lint-free surgical sponge

    Tie down sutures are secured, if this technique is preferred
  - The round window is inspected
  - If cochleostomy is preferred, a 1 mm bur is used to thin the cochlea inferior and slightly anterior to the round window

    Preferably, the endosteum of the cochlea is kept intact

    The endosteum is incised to enter the scala tympani
  - If round window insertion is preferred, the round window membrane is incised with a right angle hook or Rosen needle to enter the scala tympani
  - The electrode is passed through the cochleostomy/round window under direct visualization (Fig. 205.6)

    It is critical to be familiar with the various electrode types prior to insertion, and to practice on cadaveric temporal bones prior to using a new electrode type

    This is especially relevant as manufacturers regularly update electrode sizes and configurations

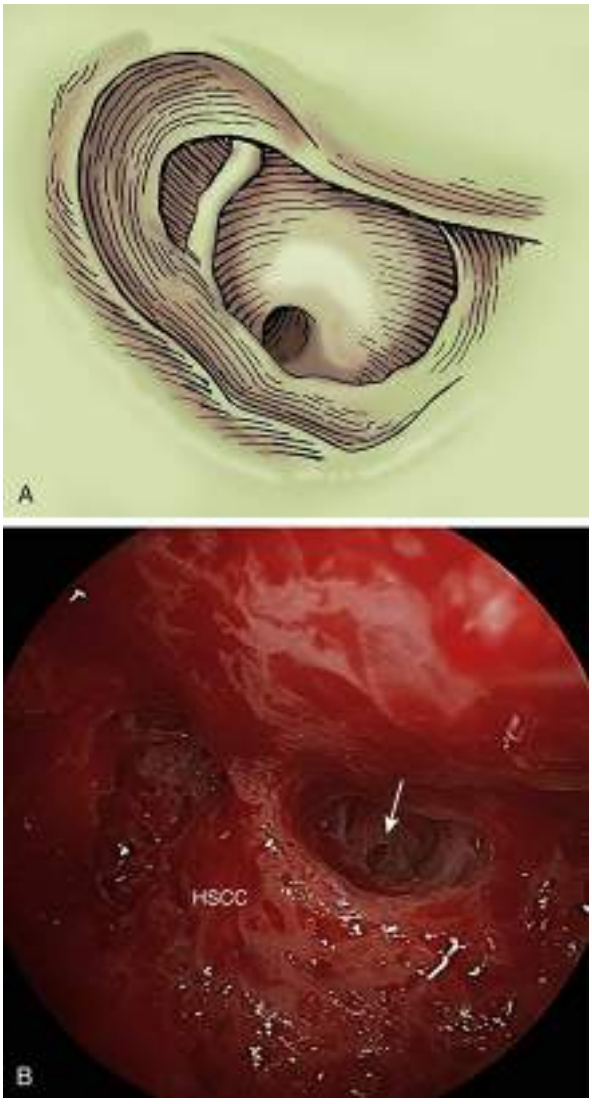

FIG. 205.4 **A,** Round window overhang is removed to expose the round window. **B,** Mastoid cavity with facial recess opened. *HSSC*, Horizontal semicircular canal. *Arrow* on cochlea.

Insertion tools are provided for some electrodes and may or may not be used per the surgeon's preference

For styletted electrodes, the surgeon must be familiar with the appropriate depth of insertion prior to advancing-off-stylet and with the technique for reloading the stylet in the event that reinsertion is required

If the electrode does not pass without resistance, the electrode may be rotated to help it pass. An anatomically normal cochlea should offer very little resistance to insertion. The need for forceful

insertion may kink the electrode and suggests a false cochleostomy, anatomic abnormality, or cochlear ossification

Slower speed of insertion has been shown to result in lower intracochlear pressure, which may result in the preservation of spiral ganglion neurons

- After insertion, pieces of temporalis fascia and muscle are packed around the cochleostomy

FIG. 205.5 Tie down sutures around head of screws.

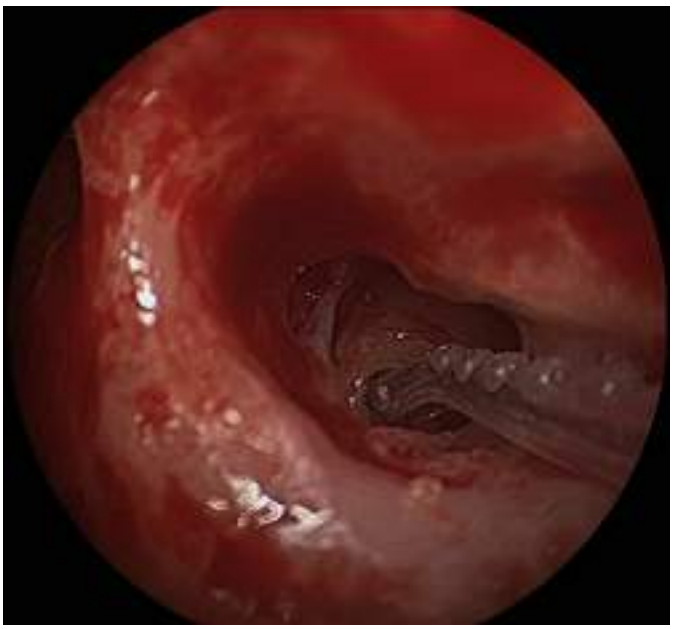

FIG. 205.6 Electrode placed through the round window.

- Unique cases

  In cases of ossification, a perilymphatic space may not be identifiable. In these situations, alternative techniques may be necessary

  The basal turn is drilled to identify the scala tympani. A depth gauge may be used to confirm a lumen beyond the basal turn

  If limited space is identified in the scala tympani, the scala vestibule may be opened to identify a lumen

  If no space is identifiable in the scala tympani or vestibuli, a cochlear drillout may be performed. A trough is made for the electrode along the expected cochlear turns. The electrode is placed in the trough (Fig. 205.7A and B)

  A double array electrode may be considered

  Initial drilling is performed in the region of the round window

  A second cochleostomy is performed in the apical turn. The incus and the buttress is removed (Fig. 205.8). The stapes superstructure may also be removed for exposure. The cochleariform process is identified and a second cochleostomy is performed anterior to the oval window and inferior to cochleariform process (Fig. 205.9A and B)

  If a cerebrospinal fluid (CSF) gusher is encountered,

  Place the patient in reverse Trendelenburg

  Allow for egress to slow

  Place electrode and pack cochleostomy with fascia and muscle

  Lumbar drain if leak persists

- Closure
  - The excess electrode is coiled within the mastoid cavity
  - Ground electrode, if present, is placed in the subtemporalis pocket
  - Periosteal flap is closed
  - Incision is closed in layers

- Mastoid dressing is secured

- Intraoperative diagnostics
  - If desired, neural response testing can be performed during closure to evaluate whether the device is functioning
  - Mastoid radiograph can be performed to confirm electrode position within the cochlea. In cases of abnormal anatomy or if there concern regarding insertion, intraoperative radiograph or fluoroscopy can be performed

Common Errors in Technique

- Receiver/stimulator placed too close to the auricle and thus the skin over the implant is in contact with the behind-the-ear processor, risking skin necrosis
- The facial recess is not adequate to visualize the round window. Limited exposure makes round window identification and electrode insertion impossible. At every step of the operation, the surgeon must consider whether the extent of dissection is adequate for exposure of the round window. Skin incision, mastoid tip development, inferior and superior extent of facial recess dissection, and removal of perifacial bone medial to the facial nerve are all critical for adequate round window exposure
- The cochleostomy is too small to accommodate the electrode without resistance
  - Adequate cochleostomy size is electrode dependent; an awareness of the characteristics of the electrode to be used is critical

Postoperative Period

- Antibiotics for 7 days
- Mastoid dressing is placed for 2 days
- Glasscock dressing is worn for comfort and to protect the ear during sleep for 1 to 2 weeks postoperatively, as needed

Complications

- Early:
  - Hematoma

    A small hematoma may be managed with a pressure dressing and close observation. Exploration and evacuation in the operating room is necessary for larger hematomas.

  - Malplacement of the electrode (over/underinsertion, false cochleostomy)

    Electrode position can be confirmed intraoperatively with device-specific neural response measurements and with a mastoid x-ray to assess electrode position. Malpositioned electrodes should be repositioned.

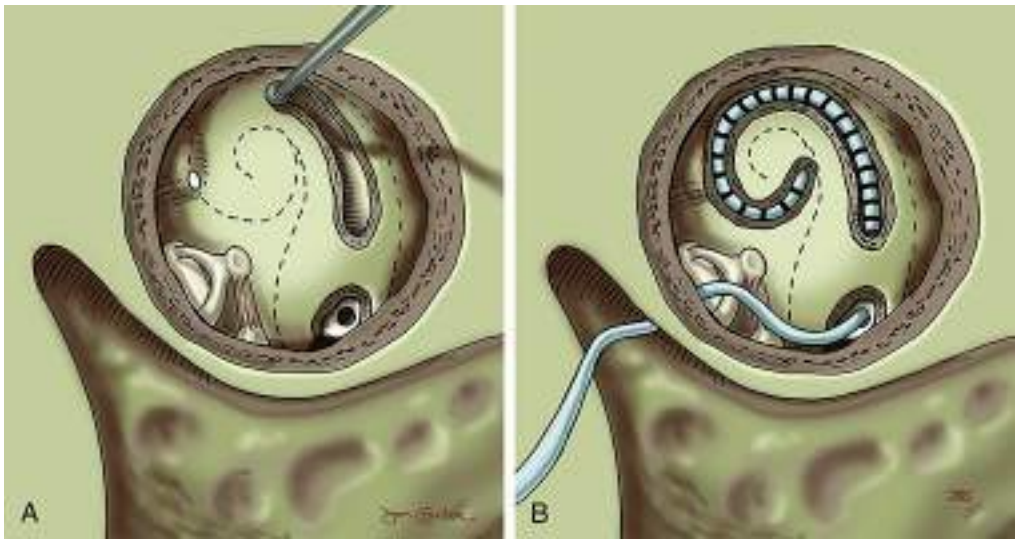

FIG. 205.7 Cochlear drillout.

A, The trough is drilled. **B,** The electrode is placed along the trough.

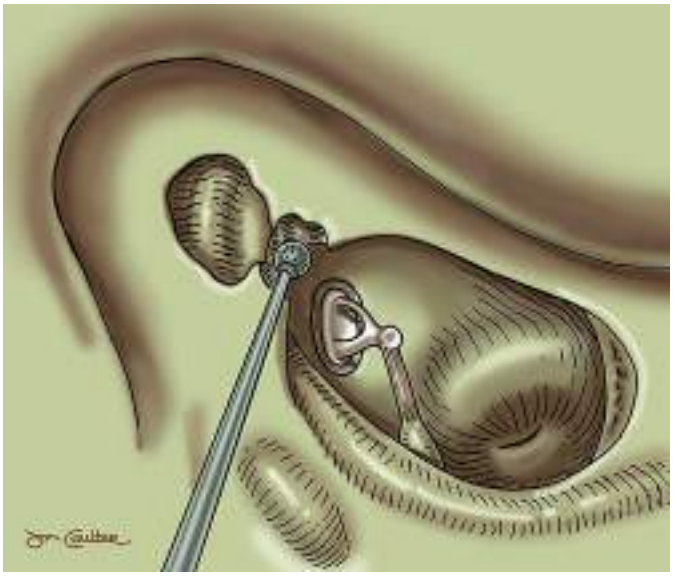

FIG. 205.8 The incus buttress is removed.

- Wound infection

  All wound infections should be treated aggressively with broad-spectrum antibiotic coverage. In cases of exposure of the device, explantation may be necessary for healing. The electrode should be cut from the receiver/stimulator and left in place to preserve the cochlear lumen for future reimplantation.

- Facial nerve injury

  Immediate weakness may be due to local anesthetic if used; observe 2 to 3 hours for spontaneous resolution. If persistent, re-exploration and nerve decompression may be warranted. Oral steroid taper may be used for late onset weakness with close clinical follow-up.

- Vertigo

  Usually spontaneously resolves after several days. May treat with a benzodiazepine in the short term. For severe dizziness, mastoid radiograph or CT to assess electrode position may be warranted to rule out malpositioned electrode.

- Dysgeusia

  May occur due to stretch, inflammation, or transection of chorda tympani nerve. Patients should be counseled in advance of this possible complication. In most cases, symptoms resolve

spontaneously after several months.

- CSF leak

  Intraoperatively, plugging of the insertion site with fascia and muscle usually controls CSF leak. Postoperatively, manage conservatively with elevated head of bed, stool softeners, bed rest. A lumbar drain is rarely needed.

- Late:
  - Migration of the device

    Can usually be managed with alternate placement of the external device. If migration is significant, exploration for repositioning and fixation may be required.

  - Hard or soft failure

    Device failure can occur due to loss of hermeticity, trauma to the site, or for unexplained failure of the hardware. The internal receiver stimulator should be replaced in such cases.

  - Skin irritation ("magnetitis")

    Often due to the use of a high-strength magnet. Remove device for several days until inflammation improves. If skin appears wet or any breakdown is noted, discontinue use of the device and treat with oral and topical antibiotics, with low threshold for conversion to intravenous (IV) antibiotics if no improvement is seen. Decrease magnet strength when resuming use.

  - Extrusion

    Requires broad-spectrum IV antibiotic coverage and, in most cases, removal of the device with eventual replacement. Coverage with vascularized tissue flaps has been described.

Alternative Management Plan

Communication via sign language, cued-speech, lip-reading.

Discussion

Evidence-Based Medicine Question

Is there a difference between round window versus cochleostomy electrode insertion?

Much debate exists surrounding the optimal surgical approach for electrode insertion in CI surgery. The two most common techniques employed are cochleostomy versus round window insertion. Advances in electrode thickness and flexibility have allowed for an increasing ability to preserve residual hearing in CI surgery, thus leading to a desire to find the optimal method for hearing preservation. The "soft surgery" approach includes creating a minimal anteroinferior cochleostomy with a low drill speed, avoiding suctioning of perilymph, slow electrode insertion, and sealing the cochleostomy in some manner. The round window approach involves directly incising the round window membrane, with drilling of the bony round window overhang as necessary, and directly inserting the electrode through the round window membrane. A third approach, the peri-round window insertion, combines elements of both, with a small cochleostomy that overlaps and includes the round window membrane. Several authors have sought to determine whether the "soft surgery" cochleostomy technique versus the round window approach affords superior hearing preservation and speech performance outcomes. A systematic review of prospective studies and case series[3] found that there was no significant difference in hearing preservation rates between the "soft surgery" cochleostomy technique and the round window approach, with total hearing loss in 0% to 26% in the cochleostomy group and 3% to 20% in the round window group. Zhou and colleagues[4] reported that in fresh human temporal bones, cochleostomy and peri-round window insertions were less likely to result in histologic trauma, and were more likely to have a linear insertion than round window insertions. Todt and colleagues[5] reported an increase in intracochlear pressure proportional to electrode insertion speed, and posited that a slower speed of insertion may correlate with better preservation of the intracochlear structures. Work remains to be done to clarify the optimal insertion techniques for hearing preservation and speech outcomes.

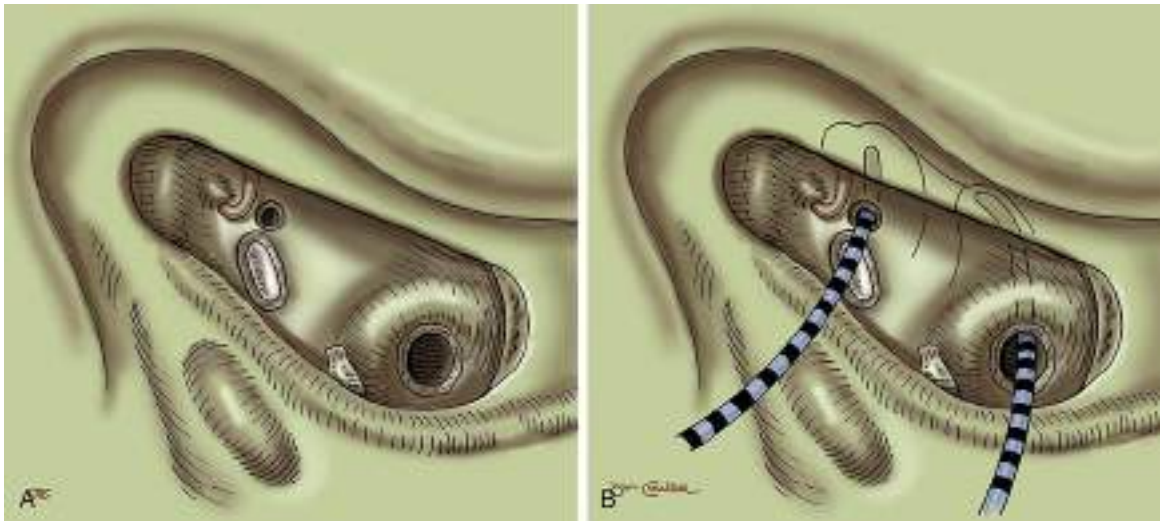

FIG. 205.9 **A**, A cochleostomy is placed at the basal turn, and a second cochleostomy is placed in the apical turn anterior to the oval window and inferior to the cochleariform process. **B,** Double array electrodes are placed.

Editorial Comment

CI surgery and habilitation have markedly advanced since the pioneering days of a single electrode with a large body-worn processor. Improvements in microchip technology, electrode design, and refinements in processing software have provided remarkable outcomes in the restoration of hearing in post-lingual recipients and the development of language in pre-lingual infants and toddlers.

The authors identify a number of key aspects regarding CI surgery that pave the way to success. Choosing the appropriate patient and family is critical in setting the path to success or failure. It is unique to pediatric recipients that they receive comprehensive educational support for the development of language and hopefully speech in those with perinatal deafness. This must be fully reinforced with family support.

Infants with bilateral severe to profound sensorineural hearing loss are now encouraged to undergo bilateral surgery. In the past it was thought that the child should delay implantation of the second ear pending anticipated improvements in implant technology. Fortunately, these advances have been made in processing software and external

stimulation devices. The internal receiver-stimulators have been forward compatible with refinements in speech coding strategies.

There is a steep learning curve in the surgical execution of pediatric cochlear implantation. Surgery in adults who subsequently lose substantial hearing and are eligible for an implant almost always have favorable anatomy of the otic capsule. In contrast, pediatric patients may have a poorly developed mastoid cavity and, even more challenging, altered cochlear anatomy. There are numerous electrode designs suited for dysplastic or ossified cochleae. The surgeon must be comfortable with choosing the appropriate electrode to meet the possible limitations posed by the inner ear anatomy. CT imaging provides this information as well as the anatomy of the mastoid, facial nerve, facial recess, and tegmen. If the existence of the cochlear nerve is in question, T2 sagittal MR images can verify its presence.

As experience and technology continue to progress, the role of implant surgery in single-sided deafness will become defined. This also holds true for auditory brainstem implant (ABI) surgery for those without a functioning cochlear nerve. ABI is currently approved for use in patients with NF 2 where the cochlear nerve has been resected. It is now being done through research protocols in patients with cochlear nerve agenesis. Stimulating the cochlear nucleus at the brainstem with the appropriate electrical signal remains a technologic and software challenge.

Barry E. Hirsch

Review Questions

1. What is the most common complication of a cochlear implant?

   a. **Skin flap infection**

   b. Facial nerve injury

   c. Device failure

   d. Permanent vertigo

2. What is not a contraindication for pediatric cochlear implantation?

   a. Absent cochlear nerve

b. Absent cochlea

c. **Mondini malformation**

d. Unrealistic family expectations

3. Which statement about infant cochlear implant is FALSE?

a. **The cochlea is smaller in an infant**

b. Blood loss must be closely observed

c. The calvarium is thin, and the dura may be easily exposed during preparation of the well

d. The implant is placed in a more vertical orientation

Cleft Palate and Velopharyngeal Dysfunction

Noel Jabbour, and Bernard J. Costello

Introduction

Comprehensive care of cleft palate deformities and velopharyngeal dysfunction (VPD) requires a thorough understanding of the full spectrum of palatal abnormalities and their effect on feeding, airway, and speech, from infancy through adolescence. Palatal clefts may range in their severity from subclinical, submucosal clefts of the soft palate to very wide clefts of the primary and secondary palate, with significant feeding and airway concerns in the neonatal period. Surgeons with formal training and experience in cleft palate repair and speech surgery must be involved, ideally as part of a multidisciplinary team, in the evaluation and treatment planning for this wide spectrum of abnormalities.

The secondary palate is composed of the hard palate (bony) anteriorly and the soft palate or "velum" posteriorly. Within the soft palate, the levator veli palatini muscle forms a dynamic sling that elevates the velum toward the posterior pharyngeal wall during speech. Other muscle groups within the velum, the tonsillar pillars, the pharyngeal walls, and the adenoid size and position also affect the quality of resonance. The combination of the soft palate and pharyngeal wall musculature jointly forms what is described as the velopharyngeal valve mechanism. This mechanism functions as a sphincter valve for regulating airflow between the oral and nasal cavities to create a combination of orally based and nasally based sounds.

Velopharyngeal insufficiency (VPI) refers to resonance abnormalities that result from the inability to completely close the soft palate to the posterior pharyngeal wall or adenoid pad during speech. This often results in nasal air escape, or hypernasality. This may be present with or

without an overt cleft of the palate. In the English language, the velopharyngeal valve should close completely for all phonemes, except /m/, /n/, and /ng/, which are nasal sounds.

Nasal air escape may result from palatal fistulas or unrepaired cleft palates. However,VPI may occur despite an intact palate, or in patients without overt palatal clefts. VPI may also be encountered in patients after adenoidectomy, orthognathic surgery, especially midface advancement, or even with sudden growth spurts in adolescence that may decrease the size of the adenoid and increase the distance from the soft palate to the skull base.

Children born with a cleft palate or a submucous cleft palate have, by definition, a malformation that has a dramatic impact on the components of the velopharyngeal valving mechanism. Specifically, clefting of the secondary palate causes a division of the musculature of the velum into separate muscle bellies with abnormal insertions along the posterior edge of the hard palate. Velopharyngeal dysfunction (VPD) and hypernasality is a major concern for patients with a cleft. The incidence of VPI following primary palatoplasty ranges from 5% to 50%, with approximately 20% requiring further surgical management for persistent hypernasality.

Surgeons caring for patients with palatal clefts or with VPD must work closely with colleagues from speech and language pathology, as many of the symptoms are related to feeding and speech. This chapter presents a technical overview of the reconstruction of palate deformities as well as operative procedures to address VPD.

Key Operative Learning Points

1. The main goals of cleft palate repair are closure of the oral–nasal communication and anatomic repair of the musculature within the soft palate.

2. The soft palate muscles play a critical role in velopharyngeal opening and closure. Palatal clefts involve abnormal anterior position of the palatal muscles. Realignment and posterior positioning of the muscles is key to improved velopharyngeal function.

Preoperative Period

History

1. History of present illness

   a. When was the cleft palate first diagnosed? The diagnostic accuracy of detection of cleft palate abnormalities by prenatal ultrasound is increasing. Cleft lips are easier to detect with ultrasound when compared with palate clefts. Some patients may have had a prenatal diagnosis of cleft palate by ultrasound. For others, it may be found at the time of the newborn examination.

   b. Birth history should include any initial airway distress and need for airway intervention, as a subset of children with cleft palate will have microretrognathia, leading to collapse of the base of the tongue and airway obstruction. Any subsequent symptoms of airway distress, including stridor, stertor, cyanosis, or acute life-threatening events (ALTE) should be discussed.

   c. Parents should be asked about typical feeding patterns. Clefts of the palate prohibit the infant from forming a seal with the oral cavity due to the oral–nasal communication. Typically, infants with cleft palate will require special bottles for feeding, such as a Haberman nipple or Pigeon nipple, which do not rely on suction. The surgeon should inquire about whether the child is being fed with breast milk or formula, the caloric density of the formula, the type of bottle being used, the ease of feeding, and the length of time for each feeding. Prolonged feeding time may be an indication of discoordinated breathing and swallowing. Further airway evaluation may be necessary. When a typical cleft of the palate occurs, breast feeding is typically not possible due to an inability to produce suction; although breast milk pumping and feeding with a cleft palate bottle is encouraged.

   d. For the older child being evaluated for VPD, a further line of inquiry into speech concerns is needed. Parents should be asked about the timing of speech development during infant and toddler years, the history of speech therapy, the frequency of therapy appointments, and what particular concerns are being addressed in therapy. Care

should be taken to note whether the speech patterns seemed to be improving, plateauing, or worsening over recent months. In some cases, fatigue and worsening speech may occur over the course of the day.

e. Both infants and older children should be asked if milk or other contents are noted to come out the nose, as this is potentially an early sign of an incompetent velopharyngeal mechanism.

f. As Eustachian tube dysfunction is common with palatal abnormalities, parents should be asked about hearing screening results, history of recurrent otitis media, any previous tympanostomy tube placement or otologic surgery, and any hearing concerns that they may have.

2. Past medical history

a. A careful review of previous evaluations and treatment strategies to address feeding and airway concerns should be undertaken.

b. Previous surgeries to the oral cavity and oropharynx should be discussed. Specifically, in the child being referred for VPD, it should be known if previous surgery has been performed on the adenoids or tonsils. As children rely on veloadenoidal closure, an adenoidectomy may unmask a previously subclinical VPD. Hypernasality following adenoidectomy may occur in up to 1 in 1000 patients, and may improve spontaneously within months. Surgical intervention may be considered if the hypernasality persists for more than 6 months.

c. Family history of orofacial clefts, congenital heart disease, or speech and language difficulties should be ascertained.

Physical Examination

1. Examination of the palate—A clear view of the hard and soft palate must be obtained. The extent of clefting and the laterality of the involvement in the hard palate should be documented. The LAHSHAL classification and the Veau classifications are common methods of documenting degree of palatal clefts. In patients being evaluated for VPD, the elevation pattern of the soft palate should be noted. Activation of the palate is best accomplished by stimulating a gag reflex with a

tongue depressor while focusing on the soft palate. A submucous cleft palate is classically described as a triad of a bifid uvula, a notch in the hard palate, and a zona pellucida (clear strip of mucosa only in the midline of the soft palate). In milder forms of submucous cleft palate, one or more of the components of this triad may be absent. More subtle palatal abnormalities, such as occult submucous cleft palate, may be seen only with palatal activation, where a vault-shaped elevation of the soft palate, a midline muscular deficiency, and an anterior position of the levator muscles may be noted.

2. Examination of the airway—Stridor, stertor, or any signs of increased work of breathing should be noted and addressed.

3. Perceptual speech evaluation—Despite several available instruments for assessment, the gold standard diagnostic tool for VPD remains perceptual, subjective, speech evaluation. Training and experience in evaluating speech is necessary for accurate diagnosis. Currently, there is no reliable objective measure of VPD as it relates to intelligibility. As a result, close collaboration between the surgeon and a speech and language pathologist is essential to make this nuanced decision to treat with surgery.

4. Examination of the ears—Presence or absence of middle ear effusions should be documented. Often bilateral myringotomy and tympanostomy tube placement can be performed at the time of palate repair for children with persistent middle ear effusions or recurrent acute otitis media.

5. Nasal endoscopy—The pattern of closure of the velopharyngeal port may be viewed by nasopharyngoscopy. The flexible scope should be passed above the inferior turbinate to obtain a birds-eye-view of the velopharyngeal closure. The patient is asked to repeat certain test phrases that require velopharyngeal closure, while direct observation is obtained of palatal motion, lateral pharyngeal wall motion, and posterior pharyngeal wall contribution to velopharyngeal closure. Air bubbling may be noticeable and correlates to the perceptual evaluation of a nasal rustle. Additionally, for patients being considered for possible pharyngeal flap, assessment of adenoid size is necessary as preoperative total adenoidectomy is often useful prior to pharyngeal flap.

6. Craniofacial examination—Common accompanying syndromic diagnoses, such as Stickler syndrome, 22q11.2 deletion syndrome, or

Treacher-Collins syndrome, may be suspected based on orbital and nasal morphology and other classic facial features.

Imaging

None: Imaging is not routinely necessary. Speech videofluoroscopy may be used in the evaluation of VPD to evaluate the velopharyngeal closure patters. This is an ideal imaging modality for patients who do not tolerate nasendoscopy. Videofluoroscopy is used to radiographically examine the upper airway during phonation with the aid of an oral and nasal contrast material. This allows for dynamic testing of the velopharyngeal mechanisms from multiple views. A speech-language pathologist should be present in the radiology suite for verbal prompting and testing. If a pharyngeal flap is being considered, the size of the adenoids also can be examined from the lateral views, to aid in decision making regarding the need for preoperative adenoidectomy.

With videofluoroscopy and nasendoscopy, the closure pattern of the palate is documented and should be differentiated. The closure patterns may help determine the success of various secondary palatal procedures designed to augment anatomic deficiencies. The most common closure patterns are:

- Coronal (55% of the normal population)—Posterior movement of the soft palate to the posterior pharyngeal wall with little movement from the lateral walls. Approximately 45% of patients with VPI have this pattern of closure.
- Sagittal (10% to 15% of population)—Primary closure is by movement of the lateral walls without significant anterior-to-posterior closure. This pattern is seen in 10% to 15% of all children with VPI.
- Circular (10% to 20% of population)—Circular closure with Passavant's ridge includes lateral wall and soft palate movement, as well as anterior movement of the posterior pharyngeal wall. Approximately 20% to 25% of children with VPI demonstrate this closure pattern.

Indications

1. Cleft palate. Palatoplasty is usually undertaken between 10 and 14

months of age. However, there are some recent data that suggest that the palate can be repaired safely as early as 3 to 5 months of age. While early repair can be accomplished, the growth consequences on the midface do not typically outweigh any measurable benefit in speech outcome. Alternatively, repair may be delayed in patients with developmental or speech delay who have not initiated verbal communication, or patients with very wide clefts.

2. Persistent and symptomatic oral-nasal fistula following primary palate repair.

3. VPD that is persistent and is related to an anatomic problem. Timing of repair is usually between 2.5 and 5 years of age. In younger children, the child's language and articulation development and lack of compliance during speech evaluations may compromise the diagnostic accuracy of preoperative assessment.

Decision making regarding which surgical repair option is best suited for a particular patient is often made as a team with the surgeon and speech and language pathologist working in close collaboration, taking into consideration palatal anatomy and velopharyngeal closure patterns. Overall, there are three surgical procedures that may be used to address VPI: Furlow palatoplasty, pharyngeal flap, and sphincter pharyngoplasty. The following are basic guidelines used in decision making:

a. Furlow palatoplasty—Usually performed in patients with anteriorly positioned levator musculature. This may be due to congenital submucous cleft palate or secondary to palatoplasty with insufficient muscular repositioning.

b. Pharyngeal flap—Usually performed in patients with intact levator sling mechanism and good lateral wall motion on either nasendoscopy or videofluoroscopy but either large anterior to posterior distance between the soft palate and posterior pharynx or poor anterior to posterior motion.

c. Sphincter pharyngoplasty—Ideal for patients with good anterior and posterior motion but poor lateral wall motion on nasendoscopy or videofluoroscopy.

There is significant variability in surgical technique for each of these

procedures, and each can be customized to fit the particular velopharyngeal closure pattern. It should be noted that the combination of Furlow palatoplasty and sphincter pharyngoplasty is performed by some surgeons with good results. The authors do not routinely perform this combined procedure due to concern for nasopharyngeal stenosis.

Contraindications

1. Medical comorbidities with increased risk for general anesthesia.

2. Significant, uncorrected bleeding disorder or nutritional deficiency that would increase the risk for complications in wound healing.

3. Severe obstructive sleep apnea may be made worse by palatoplasty or pharyngoplasty procedures. Full evaluation of the airway and treatment of sleep apnea should be initiated prior to consideration of surgical intervention.

Preoperative Preparation

1. Discontinue antiplatelet drugs if possible.

2. Discontinue the use of a bottle and switch to cup or sippy-cup with a short tip.

3. Patients should be counseled on postoperative care including pain management, dietary instructions, and possible need for arm restraints.

Operative Period

Anesthesia

General: These procedures are routinely performed under general anesthesia with patient orotracheally intubated.

Positioning

Supine.

Perioperative Antibiotic Prophylaxis

Unasyn.

Clindamycin if the patient is allergic to penicillin.

Monitoring

None.

Instruments and Equipment to Have Available

1. Dingman or ratchet mouth retractor

2. Marking pen or cotton tipped applicator and gentian violet

3. 0.5% Lidocaine with 1:200,000 epinephrine or 1% lidocaine with 1:100,000 epinephrine for older children

4. Routine oral cavity surgical set with periosteal elevators, Freer elevators, skin hooks, and long tenotomy scissors

5. 15 blade or 15c blade with long handle

6. Angled beaver blade

7. 3-0 and 4-0 absorbable suture, such as polyglactin (Vicryl) or chromic

8. Bipolar and monopolar electrocautery with insulated needle-point tip

9. Optional—70-degree endoscope and drape tape for video recording and real-time viewing by operating room personnel

Key Anatomic Landmarks (Fig. 206.1)

- Bony landmarks
  - Incisive foramen
  - Palatine process of maxilla
  - Horizontal plate of palatine bone

- Greater and lesser palatine foramina
- Hamulus of pterygoid
- Vomer

- Muscular anatomy—Differences between the muscular anatomy of a normal palate and a palate in a patient with a cleft are shown in Fig. 206.1.

Prerequisite Skills

1. Detailed understanding of the anatomy of the palate and velopharyngeal mechanism

2. Training in surgical repair of cleft palate and surgical treatment for VPI

3. Experience with surgery and suturing in the oral cavity and oropharynx

Operative Risks

1. Early complications:

   a. Bleeding

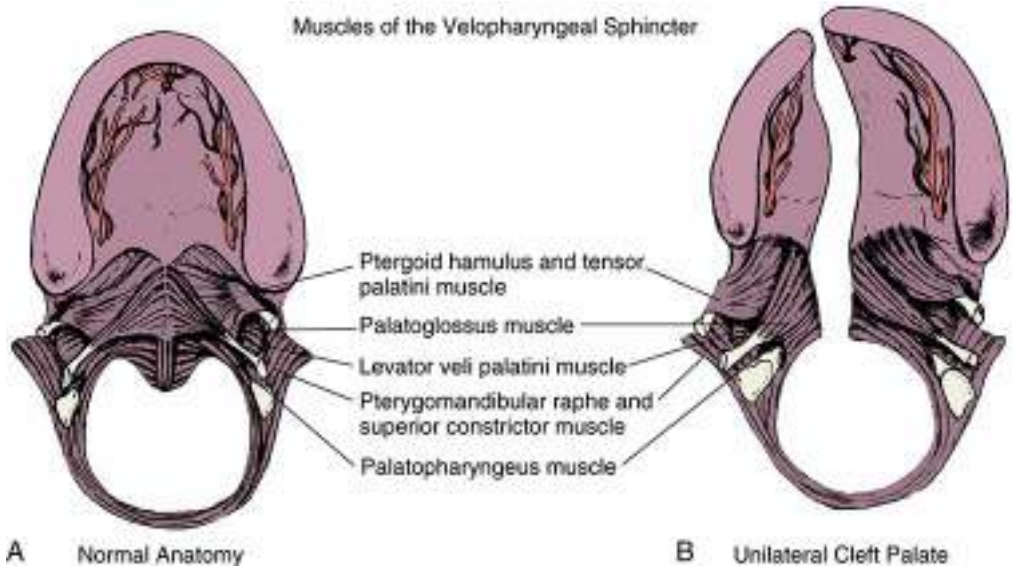

FIG. 206.1 **Anatomy of the palate and the velopharyngeal valve**

mechanism.

A, Normal anatomy. **B,** Unilateral cleft of the primary and secondary palate. Note anterior attachment of the levator muscles to the bony edge of the hard palate.

b. Airway obstruction

c. Wound breakdown/partial dehiscence

2. Late complications:

a. Palatal fistula

b. Persistent VPI

c. Obstructive sleep apnea

Surgical Technique

The following surgical technique section includes steps common to all palatal and pharyngeal procedures followed by particular steps that are specific to each individual procedure.

For All Procedures

- Orotracheal intubation with oral RAE endotracheal (ET) tube. Tape ET tube to midline taking care to avoid injury to the lower lip.
- Place the patient in the supine position with the neck slightly extended using a shoulder roll.
- Prep the face with betadine and brush oral cavity with chlorhexidine gluconate oral rinse.
- Insert Dingman or ratchet mouthgag so that a maximal view of the oral cavity and oropharynx is obtained and the ET tube is secured to the tongue in the midline. The mouthgag should be relaxed every 20 to 30 minutes throughout the case to allow for perfusion of the tongue.
- Incisions may be marked with a marking pen or a wooden handle of a cotton-tipped applicator dipped in gentian violet or methylene blue.
- Proposed incisions may be injected with lidocaine and epinephrine in a submucosal and subperiosteal plane in the hard palate, avoiding direct

injection to the neurovascular bundles. Subperiosteal injection can aid in hemostasis and facilitate undermining of the mucoperiosteal flaps.

- Optional—A 70-degree endoscope may be positioned parallel to the mouthgag and rest on the Mayo stand. This allows for real-time viewing of the surgical procedure by all personnel in the room.
- At the conclusion of the procedure, pass an orogastric (OG) tube to suction the stomach.

Two-Flap Palatoplasty With Intravelar Veloplasty

- Incise medial incisions—Nasal flaps are designed so a strip of mucoperiosteum is left on the medial edge of the hard palate cleft. For wider clefts, a wider strip of mucoperiosteum should be left. Usually, at least 2 mm is needed. When these flaps are elevated, they should meet each other or the vomer flaps without tension. The incisions should continue superficially to the tip of the uvula on each side (Fig. 206.2).
- Incise lateral incisions—Laterally, flaps are designed to include oral mucoperichondrium only without gingiva.
- Elevate the mucoperiosteal flaps bilaterally to identify and preserve the neurovascular pedicle from the greater palatine foramen. Elevation is started anterolaterally in a subperiosteal plane.
- Isolate the neurovascular bundle to allow medial mobility of the flaps. On both sides of the neurovascular bundle, detach all muscular and tendinous attachments to the posterior aspect of the hard palate, with a combination of blunt and sharp dissection. This should leave the flaps attached to the hard palate by the neurovascular bundle and the lateral pedicle only.
- Blunt dissection in the space of Ernst allows for further medialization of the soft palate. If additional medialization is necessary, the hamulus may be infractured.
- Gentle traction can be used to pull the neurovascular bundle out of the greater palatine foramen. The palatine foramen is surrounded by a periosteal cone that can be incised superficially on either side and posteriorly to allow maximal mobilization of the flap.

- Elevate the medial incisions with a periosteal elevator off of the floor of the nose to further mobilize the nasal mucoperiosteal flaps.
- Veau's muscle (a clefted muscle consisting of the levator and the palatopharyngeus) should be further dissected off of the posterior edge of the hard palate and the nasal mucoperiosteum with sharp scissors or scalpel.
- Close the nasal layer with 4-0 absorbable suture beginning anteriorly and continuing to the base of the uvula. Sutures are tied with knots on the nasal surface.
- Reposition Veau's muscle posteriorly and medially and suture the muscles on each side together in the midline with 3-0 absorbable suture.
- Approximate each side of the uvula with horizontal mattress sutures.
- Close the oral layer from anterior to posterior with 4-0 or 5-0 interrupted or mattress sutures with knots tied on the oral surface.
- Combined oral mucoperichondrial flaps may be anchored to the nasal mucoperiosteal closure with one 4-0 absorbable suture at about the midpoint. Secure the tip of the flaps to the gingiva anteriorly with interrupted 4-0 absorbable sutures.

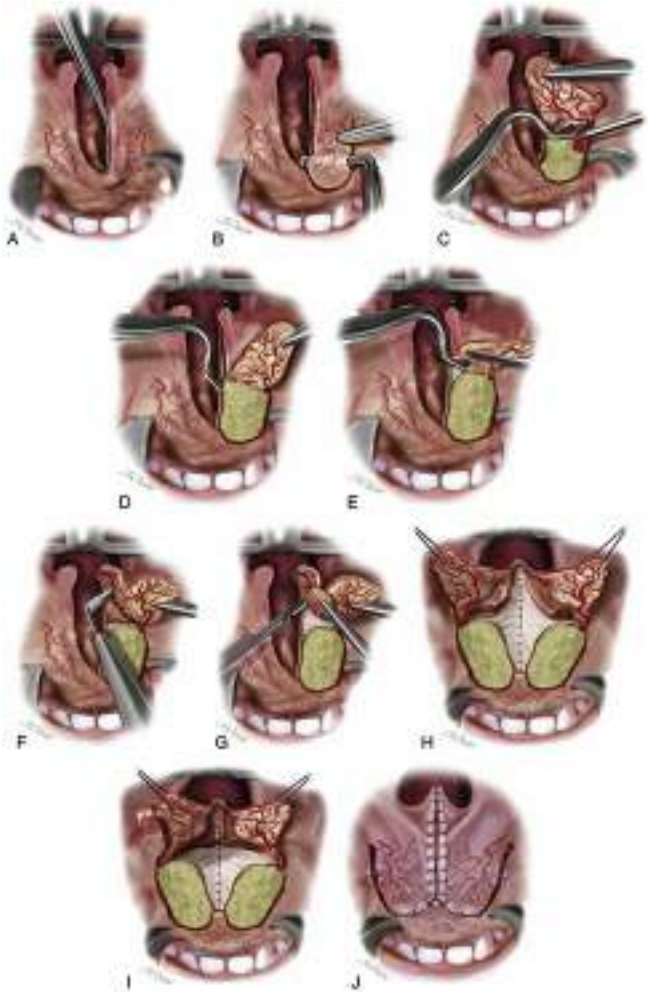

FIG. 206.2 2-Flap palatoplasty.

A, A mucosal incision is made sharply, 1 to 2 mm lateral to the oral-nasal mucosal junction to allow adequate tissue for nasal layer closure. **B,** Once mucosal incisions are complete, periosteal elevators are used to elevate the mucoperiosteal flap from anterior to posterior. **C,** The greater palatine neurovascular pedicle is identified and preserved with careful dissection around the pedicle. **D,** The nasal mucoperiosteal flap is then elevated with careful dissection in the subperiosteal plane. **E,** Dissection continues posteriorly to elevate off the abnormally attached levator muscles from the posterior edge of the hard palate. **F,** The levator muscle is then sharply dissected from the overlying oral mucosa, avoiding oral mucosal perforation. **G,** The levator muscle is similarly dissected from the underlying nasal mucosa.

H, The nasal mucosa is closed primarily. **I,** Then, the levator muscles are sutured together posteriorly, properly reorienting the muscles, and completing the intravelar veloplasty. **J,** The oral layer is then closed in the midline, medializing the pedicled flaps and leaving lateral donor sites open. Lateral stay sutures may be employed, as shown. With permission from Gailey D, Smith K. Cleft palate. In Kademani D, Tiwana P (eds): Atlas of Oral and Maxillofacial Surgery, 1st ed. St Louis, Elsevier, 2016, pp 561–568.

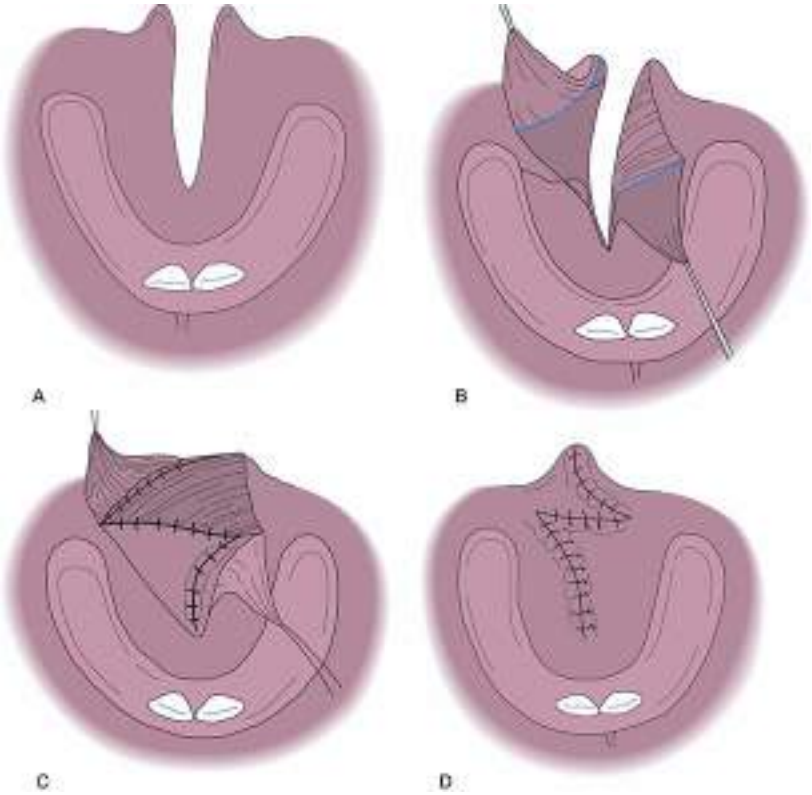

FIG. 206.3 **A,** A Veau II cleft of the hard and soft palate is shown; the cleft extends from the incisive foramen to the uvula. **B,** The Furlow double-opposing Z-plasty technique requires that separate Z-plasty flaps be developed on the oral and then the nasal layers. The cutbacks creating the nasal layer are shown in blue. **C,** The nasal layer flaps are then transposed and the nasal layer is closed with the posteriorly based nasal myomucosal flap transposed posteriorly. **D,** The oral layer is closed with the posteriorly based oral

myomucosal flap transposed posteriorly. This lengthens the soft palate, reorients the muscle fibers transversely, and creates more muscular bulk posteriorly for velopharyngeal closure.

As an alternative to the intravelar veloplasty, the above two-flap technique may be combined with a double-opposing Z-plasty in the soft palate.

Furlow Palatoplasty (Double-Opposing Z-Plasty)

- Palpate the hamulus of the pterygoid bone bilaterally. This should feel like a bony elevation just medial and posterior to the maxillary tuberosity.[4]
- Mark the oral incision from the left hamulus to the bony edge of the hard palate and from the right hamulus to the base of the uvula (Fig. 206.3).
- Mark the midline incision from the hard palate to the base of the uvula in patients with a submucous cleft palate. For patients with unrepaired clefts of the palate, this incision should be placed approximately 2 mm lateral to the cleft margin.
- Incise the midline incision with a scalpel.
- Incise the left lateral incision from the hamulus to the edge of the hard palate in the midline.
- Separate the clefted muscles off of the bony edge of the hard palate with sharp and blunt dissection. Elevate the muscle off of the underlying nasal mucosa to raise a posteriorly-based oral myomucosal flap.
- Incise the right lateral incision from the base of the uvula to the right hamulus. Back elevate an anteriorly based mucosa and submucosa flap on the right. Elevation should continue until the edge of the hard palate.
- Separate the clefted muscles on the right from the edge of the hard palate to preserve a rim of nasal mucosa to sew to.

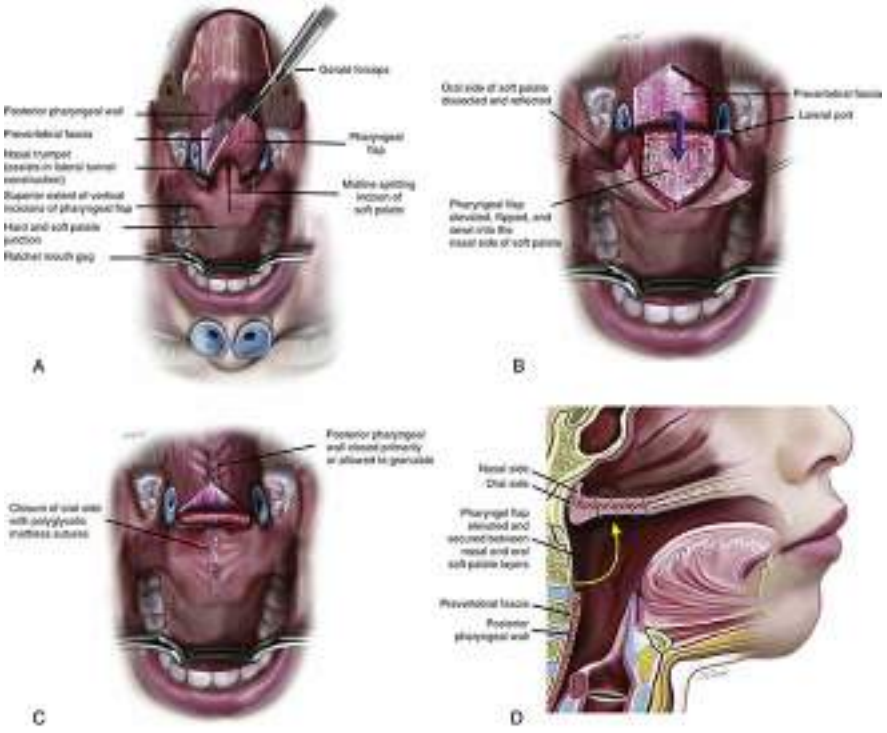

FIG. 206.4 Pharyngeal flap.

A, Elevation of superiorly based pharyngeal flap with midline soft palate incision. **B,** Flap is inset to the soft palate. **C,** Soft palate oral incision and posterior pharyngeal wall donor site are closed primarily. **D,** Lateral view demonstrating position of the pharyngeal flap above the transverse plane of the palate and inset between the oral and nasal layers of the palate. With permission from Costello BJ, Ramon R. Pharyngoplasty for velopharyngeal incompetence. In Kademani D, Tiwana P (eds): Atlas of Oral and Maxillofacial Surgery, 1st ed. St Louis, Elsevier, 2016, pp 578–588.

- Create an anteriorly based left nasal mucosal flap by incising the left nasal layer from the base of the uvula to just medial to the taurus tuberus.
- Create a posteriorly based right myomucosal flap by incising the nasal layer on the right from the edge of the hard palate to just medial to the taurus tuberus.
- Once all flaps are elevated, ensure hemostasis.
- Closure of the nasal layer should begin from anterior to posterior. The

anteriorly based nasal mucosal flap should be transposed to the right and sewn to the nasal mucosa at the edge of the hard palate on the right with 4-0 absorbable sutures in a simple interrupted fashion.

- Next, the right posteriorly based myomucosal flap is transposed and sewn toward the left superior constrictor muscle. This flap is then sewn to the adjacent mucosal edges on each side; anteriorly to the nasal mucosal flap from the right, and posteriorly to the edge of the nasal incision along the posterior edge of the soft palate.
- Approximate the uvula with simple interrupted and mattress sutures.
- Close the oral layer from anterior to posterior. The right anterior-based myomucosal flap should be transposed to the left and sewn to the oral mucosa at the edge of the hard palate.
- Transpose the left posteriorly based myomucosal flap to the right, then sew anteriorly to the previously inset mucosa only flap, and posteriorly to the free edge of the oral mucosal incision on the right.

Superiorly Based Pharyngeal Flap

- Mark out the incision along the posterior pharyngeal wall and palate (Fig. 206.4). The tip of this flap should be near the most inferior aspect of the pharynx that can be viewed with the mouthgag in place.[5]
- Inject lidocaine with epinephrine.
- Incise the midline of the palate with slightly more dissection on the oral layer than the nasal layer, with respect to the anterior extent of the incision.
- Incise the marked out area of the pharyngeal wall down to the prevertebral fascia. Elevate the superiorly based myomucosal flap off of the prevertebral fascia, with a combination of blunt and sharp dissection. The flap should be elevated toward the skull base, in a plane at or above the level of the hard palate. The size of the port can be customized using nasal trumpets as a guide, and suturing the divided palate more posteriorly to narrow the port as needed.

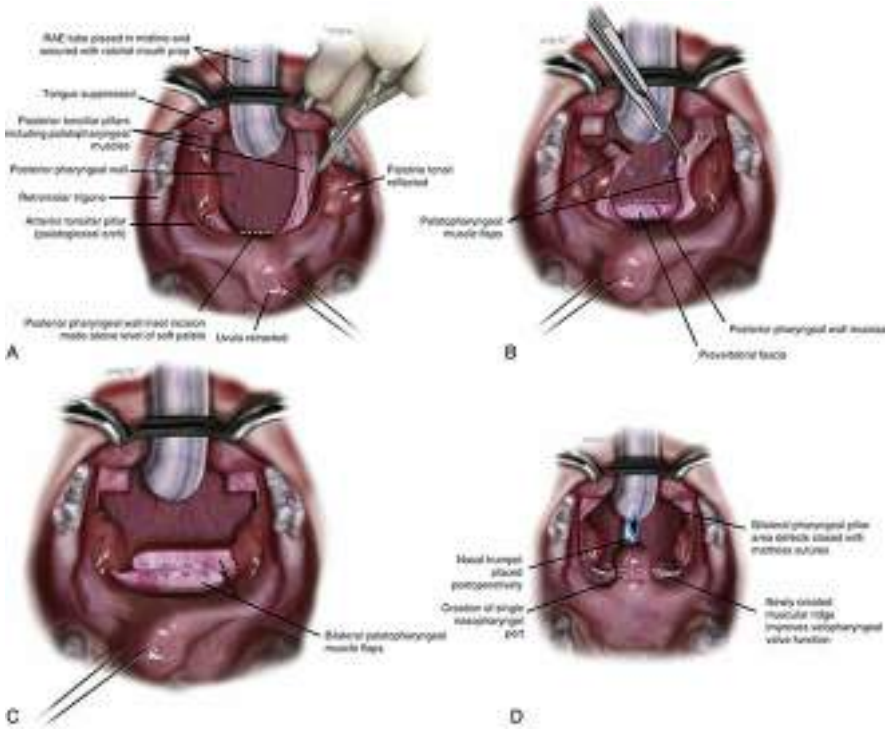

FIG. 206.5 Sphincter pharyngoplasty.

A, Outlined incisions for sphincter pharyngoplasty involving posterior tonsillar pillar and inset incision in the posterior pharyngeal wall. **B,** Flaps are elevated and medially rotated. **C,** Flaps are sutured together and inset with mucosal surfaces superficial and muscle-surface deep. **D),** Single nasopharyngeal port is thus created; donor site mucosal wounds are closed primarily. With permission from Costello BJ, Ramon R. Pharyngoplasty for velopharyngeal incompetence. In Kademani D, Tiwana P (eds): Atlas of Oral and Maxillofacial Surgery, 1st ed. St Louis, Elsevier, 2016, pp 578–588.

- Obtain hemostasis with bipolar electrocautery.
- Sew the tip of the pharyngeal flap to the nasal layer at the most anterior aspect of divided palate with 4-0 absorbable suture. Continue this inset laterally on each side with mattress sutures until the flap is well secured to the palate.
- Reapproximate the oral mucosa of the midline palatal incision over the pharyngeal flap.
- On each side, the aperture of each port can be adjusted with the final

few sutures.

- Ensure final hemostasis, especially in the most superior aspect of the base of the flap, which is a common area for bleeding.
- Place a nasal trumpet or 4-0 endotracheal tubes on each side of the nose and visualize passage into the pharynx through the ports. Once in an adequate position, these can be secured together with a transseptal stitch; nasal trumpets may simply be taped to avoid dislodgement.
- Close the donor site in the posterior pharyngeal wall with 3-0 absorbable suture.

Sphincter Pharyngoplasty

- Retract the uvula anteriorly with a suture.
- Mark out incisions along the posterior tonsillar pillar and the horizontal inset incision in the posterior pharyngeal wall (Fig. 206.5).
- Inject local anesthetic.
- Incise and elevate myomucosal flaps from each posterior tonsillar pillar from inferior to superior, including as much of the palatopharyngeus muscle as possible.[5]
- Incise inset incision down to the prevertebral fascia and spread slightly with peanut and Kittner forceps.
- Ensure hemostasis with bipolar electrocautery.
- The myomucosal flaps are inset into the horizontal incision and to the surrounding mucosa with 4-0 absorbable suture. The flaps may be sewn end to end or in an overlapping fashion. The aperture of the single velopharyngeal port may be controlled by the length of the flaps and the degree of overlap.
- Close the defects of the posterior tonsillar pillars with 4-0 absorbable suture.

Common Errors in Technique

1. Failure to elevate the flaps adequately to promote tension-free closure.

2. Inadequate hemostasis resulting in postoperative bleeding or hematoma.

3. Not relaxing the mouthgag frequently, resulting in postoperative edema of the tongue.

Postoperative Period

Postoperative Management

1. Admit for observation until oral intake is adequate

2. Arm restraints at all times for 2 weeks except when held and supervised for a short period of time

3. Smooth liquid diet for 2 weeks

4. No pacifiers, bottles, or sippy cups with long spouts

5. Follow-up in 1 to 2 weeks

6. Antibiotics for 7 days postoperatively (optional)

7. For younger children, encourage sips of water after every meal to keep the mouth clean; older children should use chlorhexidine gluconate oral rinse twice a day(BID) × 14 days.

Complications

1. Postoperative bleeding—May stop spontaneously or with oxymetazoline spray. If persistent, may require return to operating room for control.

2. Palatal dehiscence—Continue liquid diet and watchful waiting. If fistula develops, may need to repair secondarily.

3. Persistent VPI—Continue watchful waiting and speech therapy for at least 1 year prior to consideration of repeat speech surgery, as speech may progressively improve.

4. Nasopharyngeal stenosis—Possible complication of both pharyngeal flap and sphincter pharyngoplasty. It is may result from cicatricial scar in

velopharyngeal port; surgical repair is necessary if it develops.

Alternative Management Plan

1. Speech obturator or palatal lift appliance—Useful in patients who have contraindications to surgery or who have severe sleep apnea that may be made worse by surgery.

2. Injection augmentation of posterior pharyngeal wall—Injection of a filling agent, such as calcium hydroxylapatite or adipose tissue grafting, into the posterior pharyngeal wall has been described and may be useful for small gaps and for pressure VPI in woodwind and brass musicians.

Discussion

Evidence-Based Medicine Question

Does isolated orofacial clefting pose an increased risk of sleep apnea?

Patients with orofacial clefting have increased rates of sleep-disordered breathing and obstructive sleep apnea compared to the general pediatric population. This is easily predicted in patients with obvious airway obstruction from craniofacial abnormalities, such as midface hypoplasia, microretrognathia, or glossoptosis. However, it may still be present, though more inconspicuous, in non-syndromic patients.

In 2011, Robison and Otteson,[1] reported a review of 459 patients with cleft lip, cleft palate, or cleft lip and palate. A total of 172 patients (37.5%) had symptoms of sleep-disordered breathing, with 89 of them (51.7%) undergoing surgery for sleep-disordered breathing or sleep apnea, most commonly tonsillectomy and adenoidectomy. Similarly, in 2014, Silvestre et al.[2] reported the results of the Pediatric Sleep Questionnaire completed as a screening tool by 867 patients and families in a tertiary care cleft clinic. Of these, 489 had isolated cleft lip and/or palate. A positive screen was noted in nearly 15% of these patients. In a separate paper, the same group reported a 28% positive screening rate in non-syndromic patients evaluated in a craniofacial clinic.[3]

It is important to note that all of the cleft surgeries, described above,

are designed to minimize the velopharyngeal port size and thus may increase the airway resistance, placing children at increased risk for primary snoring or apnea. Cleft surgeons should routinely inquire about patient sleep habits and symptoms, even in patients with isolated cleft lip and or palate. Screening with a polysomnogram should be considered in symptomatic patients, as airway interventions may be indicated.

Editorial Comment

VPD is a challenging component of cleft care, which requires multidisciplinary collaboration to accurately diagnose and successfully treat patients. As always in cleft surgery, the goal is to achieve a competent velopharyngeal port at the time of the initial palate surgery. Even in expert hands, this is not always possible.

This chapter details several surgical interventions designed to address VPD either primarily or secondarily when VPD develops after an initial palate repair. Although successful speech results are the rule in any type of palate repair, our center has shown increased incidence of VPD after straight-line palatoplasty where, either due to altered growth or scaring, the levator muscles often migrate anteriorly with time. This can lead to anatomic abnormalities similar to an unrepaired submucosal cleft palate (SMCP) and variable VPD.

Our first-line treatment in these challenging patients is to lengthen the palate and posteriorly position the muscles with a conversion to a Furlow palatoplasty similar to patients with SMCP. Indeed, we have moved away from straight-line repair and now employ the Furlow technique for all primary cleft palates. We have found that even with wide clefts, the Furlow technique can be used successfully in most patients.

Review Questions

1. Early complications from palatoplasty include all of the following, *except*:

a. Bleeding

b. Wound breakdown/dehiscence

c. Tongue swelling

d. **Scarring**

2. Late sequelae of palatoplasty include all of the following *except*:

a. Scarring, causing foreshortening of the palate

b. Sleep-disordered breathing

c. Persistence of velopharyngeal insufficiency

d. **Hearing loss**

3. In the English language, all of the following consonant phonemes require the velopharyngeal valve to be open (nasal resonance), *except*:

a. **/f/**

b. /ng/

c. /m/

d. /n/

Microtia

Arturo Bonilla, and Noel Jabbour

Introduction

The prevalence rates of microtia and aural atresia vary widely in different regions of the world, from 0.83 to 17.4 per 10,000 live births. The vast majority of these anomalies are sporadic, but also they may be found in association with other congenital anomalies or known syndromes, such as oculo-auriculo-vertebral syndrome, CHARGE syndrome, or Treacher-Collins syndrome. Microtia may be unilateral or bilateral, with over 85% of cases being unilateral.

Auricular reconstruction for microtia is a challenging but rewarding endeavor. Patients often present in infancy, years before any surgical intervention is possible. This provides the microtia surgeon and the family time to develop a relationship and to consider appropriate surgical and nonsurgical options. When the time comes, successful surgical reconstruction of the auricle requires an extensive knowledge of the normal anatomy of the auricle, meticulous attention to detail, and atraumatic handling of tissues.

Throughout the years of counseling, patients should be advised regarding all options for surgical repair, including watchful waiting, costochondral graft, external prosthesis, and use of an alloplastic implant. Worldwide, the most common method of repair remains the costochondral cartilage graft. This chapter will primarily cover this method of reconstruction. Reference is made at the conclusion of the chapter to classic articles covering alternative methods.

Key Operative Learning Points

1. The costochondral cartilage graft technique is a safe procedure as long

as meticulous tissue handling is applied and strict postoperative care is followed.

2. Careful handling of the cartilage and awareness of the proximity of the pleura is very important. A preoperative contingency plan should be in place for the unlikely occurrence of a pleural injury or pneumothorax.

3. An understanding of the thickness of the recipient skin pocket is critical to avoid both extremes: (1) too thick with subsequent loss of ear definition; and (2) too thin with compromise of the skin from ischemia. An appropriate skin flap will result in excellent detail of the sculpted cartilaginous framework.

4. Similarly, there is a progressively popular incentive to complete the reconstructive process at increasingly earlier ages and in fewer stages. This sense of urgency must be balanced with a fair measure of judicious waiting until an appropriate age when there is enough rib material in the donor site, maturity of the patient to handle postoperative care, and adequate time between stages to allow for appropriate neovascularization.

Preoperative Period

History

1. History of present illness

   a. Most auricular deformities will have been present from birth, but it is important to elicit any changes in development of the ear or history of trauma to the auricle.

   b. Parents should be asked about how bothered the child is by the auricular deformity. How is it affecting the child's development, school performance, or socialization in daycare?

   c. Any concerns regarding hearing should be addressed. Did the child pass the newborn hearing screening? What plans are in place already for hearing habilitation, if any?

   d. The surgeon's experience and the realistic expectations of the patient and/or parent should be addressed (Fig. 207.1).

FIG. 207.1 The synchondrosis between the sixth and seventh rib has been harvested along with the eighth rib cartilage. These will be used to construct the framework of the reconstructed ear. An x-ray film template is helpful both for marking the skin and for fashioning the cartilage framework.

2. Past medical history

   a. Has the child had any previous attempts at auricular surgery or has an auricular prosthetic ever been used? Surgical repair is optimal in a recipient bed whose vascular supply has not been compromised by trauma, scarring, or previous surgery.

   b. Prior evaluation. Has the child had any of the following?

      1) Genetics work-up

      2) Renal ultrasound

      3) Electrocardiogram (EKG)

      4) Temporal bone computed tomography (CT) scan

   c. At the initial visit, careful questioning regarding birth history and neonatal exposure history may uncover potential causes of the microtia. This should be approached cautiously as usually the cause of microtia is never found. In the absence of any known teratogen use in pregnancy, anxious parents should be reassured that there is no evidence that they did anything wrong to cause this malformation.

d. Concomitant medical issues: Parents should be asked about previous hospitalizations including neonatal intensive care unit (NICU) stay as well as known medical conditions and outcome of genetic testing if previously performed.

e. Family history: Is there a family history of microtia, atresia, skin tags, cleft-craniofacial abnormalities, congenital cardiac abnormalities, kidney disease, or hearing loss?

f. If the time for surgical repair is near, assess risk for bleeding or wound-healing difficulty by asking about:

1) Known bleeding disorders in the family

2) Antiplatelet drugs

3) Patient or family history of keloid formation

4) Herbal products

5) Smoking or smoke exposure

6) Nutritional status

g. When considering a costochondral graft, it is important to ask about any known pulmonary disease, skeletal dysplasias, or rib anomalies. Has the child ever had a chest radiograph?

Physical Examination

1. Examination of the auricle

- Careful examination and documentation of the anatomy of the auricle is critical. If there is an unaffected side, careful measurement of the auricular dimensions and projection is useful. Photodocumentation of the microtic ear and the normal auricle is essential. Examination of the preauricular area may reveal accessory tragi or sinus tracks that may be addressed before or during one of the stages of surgery. The extent of the microtic deformity may be graded as follows:
  - Grade I—nearly normal ear with deficiency in at least one dimension
  - Grade II—ear with structural deficiencies but recognizable anatomy
  - Grade III—rudimentary soft-tissue with small "peanut" remnant
  - Grade IV/anotia—absent auricle

2. Otoscopic examination

- Bilateral examination of the ear canals, if present, with an otoscope is essential in assessing for aural atresia and external auditory canal stenosis. In unilateral cases, it is very important to document the examination of the tympanic membrane of the unaffected side, as this may be the only hearing ear. Effusions in the normal ear should be followed closely until resolution.

3. Facial symmetry

- Especially in unilateral cases of microtia, the presence of facial asymmetry, hemipalatal paresis, or jaw discrepancy, may indicate a need for further assessment for hemifacial microsomia. If any significant crossbite or jaw asymmetry is noted, this may warrant orthodontic or oral surgical evaluation prior to microtia repair, as the ultimate position of the reconstructed auricle may change with these interventions.

4. Audiometric evaluation

- Parents should be reminded that hearing is the first priority. Assessing hearing status on physical examination in an infant or young child is unreliable. Aural atresia will result in a maximal conductive hearing loss. If the hearing status of the contralateral ear or the bone conduction thresholds of the affected ear cannot be confirmed, then auditory brainstem response (ABR) testing should be ordered.

5. Examination of the rib donor site

   a. Anthropometric measurements—Having adequate costochondral graft material for surgical repair of microtia is dependent upon the patients height and weight even more so than on age. An average 7-year-old will have an appropriate amount of costochondral graft material. Assessing the position of the patient on the growth chart will aid in determining the proper timing of surgery. If the patient is very high on the growth curves, surgery may be considered at an earlier stage. Alternatively, in the patient who is below the 10th percentile, consideration should be given to delaying repair for at least 1 more year.

   b. An examination of the chest wall should reveal any skeletal abnormalities, including pectus excavatum, which may present a

challenge for cartilage harvest. Palpation of the lower border of the ribs will reveal any contour irregularities that may be present.

Imaging

Chest radiograph—A two-view, frontal and lateral, chest radiograph should be reviewed preoperatively to rule out any chest wall or cardiac silhouette abnormalities.

CT—A maxillofacial CT scan is not required but should be considered in patients with jaw asymmetry, facial asymmetry, or hemifacial-microsomia. We perform one CT scan of the temporal bones in patients with aural atresia, usually around age 5, to assess candidacy for atresiaplasty and to rule out congenital cholesteatoma.

Indications

1. Microtia with desire to correct auricular deformity.

2. Realistic expectations for surgical outcome (Fig. 207.2).

Contraindications

1. Medical comorbidities with increased risk for general anesthesia.

2. Significant, uncorrected bleeding disorder or nutritional deficiency that would increase the risk for complications with wound healing.

3. Chest wall skeletal abnormalities, such as significant scoliosis or pectus excavatum.

4. Unrealistic expectations or psychological instability (Fig. 207.3).

Preoperative Preparation

1. Photodocumentation with standard lateral view, frontal, and oblique views. A birds-eye-view may be useful to assess conchomastoid angle discrepancies.

FIG. 207.2 An example of “closed framework” on the left (Bonilla); details of the cartilage are carved into the framework; tragus has been carved and will be attached to the main framework prior to insertion. An example of “open framework” on the right (Jabbour); antihelix is augmented with pieces of cartilage sutured to the main framework. Both include the eighth rib sutured to the framework for the helix.

FIG. 207.3 Typical examples of postoperative view immediately following stage I reconstruction *(left)* and 1-week postoperative *(right)*. Drains are left in place for 5 to 7 days.

2. A template of the unaffected ear or of a sibling or parent's ear, in bilateral cases, may be fashioned by tracing the auricular features onto x-ray film. The film then may be cut to develop a template that may be sterilized for use in the first stage of surgery.

3. Discontinue antiplatelet drugs if possible.

4. Patients should be counseled on the importance of postoperative care and advised on realistic surgical outcomes.

Operative Period

Anesthesia

General: Due to the need to harvest a costochondral graft, the first surgical stage should always be performed under general anesthesia. In adults, the subsequent stages may be performed with local anesthesia and sedation; however, general anesthesia is preferred for patient comfort.

Positioning

Supine: The patient is positioned supine so that both ears may be viewed and accessed during the procedure.

Perioperative Antibiotic Prophylaxis

First-generation cephalosporin

Second-generation cephalosporin

Clindamycin if allergic to penicillin.

Monitoring

None.

FIG. 207.4 Progression of steps for second stage reconstruction with lobule transposition. A Z-plasty is marked to transpose the lobule posteriorly. A pocket is created in the lobule to insert the inferior aspect of the cartilage framework. Excess skin on the superior aspect of the lobule is used to deepen the conchal bowl, and multiple smaller W-plasty incisions are performed to irregularize the scar. Two-week postoperative view is shown on the right.

Instruments and Equipment to Have Available

1. Basic surgical set with fine instruments for soft-tissue dissection

2. Rib harvesting set, with periosteal elevators and Doyen elevators

3. Suture: 4-0 undyed nylon suture, 3-0 and 4-0 Vicryl suture, 5-0 monocryl suture, or similar

4. Depending on surgeon preference, bipolar scissors or contact laser for fine-control rib excision (optional) (Fig. 207.4)

Key Anatomic Landmarks

1. Normal auricular anatomy

2. Muscular anatomy of the lower chest wall

a. Rectus abdominus—inserts to cartilaginous components of fifth, sixth, and seventh ribs and xyphoid process.

b. External abdominal oblique muscles—origin is external surfaces of ribs 5 to 12; inserts to abdominal aponeurosis.

c. Internal abdominal oblique muscles—has insertions into ribs 8 to 12 and abdominal aponeurosis.

d. External intercostal muscles.

e. Internal intercostal muscles.

3. Intercostal space—Neurovascular bundle runs in the superior aspect of each intercostal space in the order of vein, artery, nerve, from superior to inferior.

4. Costochondral junction—The bony to cartilaginous junction of each rib can be identified by the changes in color at the junction and confirmed with a 25-gage needle intraoperatively after exposing the rib, as the needle will pass more easily into the cartilaginous portion.

Prerequisite Skills

1. Experience in costochondral graft harvest

2. Skill and experience in carving costochondral cartilage for microtia reconstruction

3. Soft tissue reconstruction techniques, including skin-grafting

4. Thorough knowledge of the normal anatomy of the auricle

Operative Risks

1. Early complications:

a. Seroma or hematoma

b. Wound infection and/or breakdown

c. Ischemia of skin overlying cartilage framework

2. Late complications:

a. Unsatisfactory aesthetic result

b. Asymmetry

c. Scarring

Preoperative Preparation

- Design of auricular template from flipped image of contralateral auricle (if available). This can be performed by printing a horizontally-flipped photo in photo editing software or by tracing the contralateral ear with transparency film.
- The authors use x-ray film, which can be sterilized, for the auricular template.

Surgical Technique

There are two techniques: (1) three-stage Bonilla technique and (2) four-stage technique.

Stage I—Creation and Insertion of Cartilage Framework and Tragus

- Preoperative
  - Mark patient ear and rib to confirm laterality in preoperative area.
  - Confirm final sizing of template and send for fast sterilization.
- Induction/preparation
  - Ancef.
  - Decadron.
  - Inject lidocaine 1% or 2% with 1:100,000 epinephrine into the proposed incision of chest wall.
  - Prep ear and face as well as chest.
  - During rib harvest, keep the patient's head facing up to avoid soreness of the neck from prolonged lateral positioning.
  - Drape in such a way that the contralateral ear may be viewed if needed. Have the nose exposed, as the angle of the nasal dorsum

parallels the ideal auricular angle.

- Rib harvest
  - Make a 3 to 4 cm incision overlying rib 7. This will allow access to ribs 6 to 8.
  - The contact laser or bipolar cautery is used to divide the adipose and muscular layer overlying the ribs (use of the contact laser allows less thermal injury, less bleeding, and less postoperative pain).

FIG. 207.5 Progression of steps for third (separation) stage. The framework is elevated and a polyethylene implant wedge is placed for projection and is covered with a conchal-based flap and full-thickness skin graft. The picture on the right is the final result.

  - The ribs are handled carefully with skin hooks to avoid trauma to the perichondrium.
  - The contact laser or bipolar cautery is used to dissect the soft tissue away from the ribs with the ability to avoid the area of the pleura and to control hemostasis.
  - The cartilaginous portion of the first floating rib (eighth rib) is excised medially to laterally until the bony-cartilaginous junction is identified. A small layer of cartilage is left covering the junction to avoid a hard, pointed remnant of the bony rib.
  - The synchondrosis of ribs 6 to 7 is identified and marked with a sterile marking pen using the preoperative template that was sterilized.
  - Using the contact laser, the marked synchondrosis is carefully

excised with care to stay close to the cartilage and away from the pleura.

- The cartilage is placed in sterile saline with antibiotic solution.
- The cavity is evaluated for any bleeding.
- A 10 French JP drain is placed deep to the muscle layer.
- The muscular and adipose layers are closed separately with interrupted 4-0 Vicryl sutures.
- The skin is closed with a running subcuticular suture with either 4-0 Vicryl or 5-0 monocryl.
- Dermabond, Mastisol, and Steri-Strips are used to reinforce the skin closure.

- Analgesics
  - Depending on the surgeon's preference, pain control is attained by the anesthesiologist with an epidural injection or a paravertebral block. The timing of this placement is variable; if placed prior to rib harvest, decreased narcotic use during the case may be possible; if placed during the cartilage carving, decreased operative time may be achieved.
- Cartilage carving
  - The rib grafts are kept moist and are handled very carefully to avoid trauma to the perichondrium.
  - Soft tissue is removed from the cartilage with tenotomy scissors.
  - The floating rib (eighth rib) is first cleaned of soft tissue. This will be the future helix. The most medial part of this floating rib will be the crus of the helix. The helical crus is then formed by excising the most medial portion of the eighth rib cartilage to make a slightly pointed edge. In order to cause a bend of the cartilage, the outer edge is trimmed and the perichondrium is removed very carefully with a scalpel. Care must be given to avoid excising too much cartilage. This would cause the cartilage to become too thin with eventual buckling.
  - The synchondrosis is also cleaned by removing the soft tissue. The x-ray template is then placed over the synchondrosis in order to size

the new ear. A sterile marking pen is used to mark the outer area of the template. This cartilage is then excised. If the synchondrosis cartilage is too thick, it may be thinned by trimming with a scalpel.

- The helix (eighth rib) is then placed on the outer edge of the framework and secured with 4-0 clear nylon sutures with the knots kept on the undersurface.
- The triangular fossa is then sculpted with the scalpel or skin punch and the scaphae is deepened with a 4 mm skin punch or cartilage gouge.
- An extra piece of cartilage is then sculpted into the shape of the tragus.
- This piece is then anchored to the area of the helical crus superiorly and to the lower framework inferiorly with a 4-0 clear nylon suture in a mattress fashion with knots on the undersurface of the cartilage framework.
- The completed framework is kept in normal saline with antibiotic solution (Fig. 207.5).

- Recipient pocket
  - Inject 1% or 2% lidocaine with 1:100,000 epinephrine just anterior to the microtic vestige.
  - A marking pen is used to make a vertical incision just anterior to the microtic vestige.
  - Make an incision on the marking with a #15 scalpel blade.
  - Undermine a skin pocket with the tenotomy scissor with very careful attention to stay immediately under the subdermal plexus. If the skin pocket is too thick, the new ear will lack definition. If the skin pocket is too thin, there will be a risk of ischemia and potential necrosis of the skin with subsequent exposure of cartilage.
  - The pocket is undermined to 3 mm lateral to the outer ear marking that was placed preoperatively.
  - Hemostasis is controlled with the needlepoint cautery or bipolar with careful attention to avoid cauterization on the actual skin (this can cause damage to the subdermal plexus).

- The vestigial cartilage is excised with the tenotomy scissor with care to avoid buttonholing the skin.

- Insertion of cartilage framework
  - A #10 French drain is inserted approximately 2.5 cm posterior–inferiorly to the future ear.
  - The cartilaginous framework is then placed into the skin pocket and the appropriate orientation and position is attained; suction is then applied to the JP drain.
  - The skin is closed with a running 6-0 prolene suture, and the drain is secured with a 3-0 prolene suture.
  - Antibiotic ointment is placed over the incision site and the drain site, and a telfa dressing is then applied over the ear.
  - A sterile ear dressing is then applied without pressure on the ear.

Stage II—Lobule Reconstruction and Deepening of Conchal Base (2 Months After First Stage)

- The height of the normal ear is measured preoperatively in order to maintain the same height on the microtic ear.
- Inject 1% or 2% lidocaine with 1:100,000 epinephrine anterior and posterior to the microtic vestige with care to avoid injecting inferiorly to avoid vestige ischemia and necrosis of the skin.
- Also inject into the inferior aspect of the framework over the future site of the lobule transposition.
- An incision is made in the front of the skin vestige, and continued superiorly then posteriorly to the vestige. The incision is continued posteriorly to the edge of the framework.
- The inferior part of the cartilaginous framework is then exposed with the tenotomy scissor.
- The skin vestige is then rotated posteriorly to its future location.
- A small pocket is then made in the lobule, and the inferior part of the exposed cartilaginous framework is then inserted into the skin pocket. This maneuver allows the ear to keep its vertical height.

- The conchal skin is then undermined and soft tissue is excised in order to deepen the conchal base.
- The base is anchored with 6-0 prolene sutures and all of the remaining skin edges are then closed with interrupted 6-0 prolene sutures.
- Antibiotic ointment is placed over the incision site and a telfa dressing is then applied over the ear.
- A sterile ear dressing is then applied without pressure on the ear.

Stage III—Creation of Postauricular Sulcus and Elevation of Framework (2 Months After the Second Stage)

- Full-thickness skin graft harvest
  - The ear and groin area are prepped.
  - A marking pen is used to mark approximately 2 mm around the cartilaginous framework. In addition, the groin is marked where the full-thickness skin graft will be harvested.
  - Inject the markings on the ear and the groin with 1% or 2% lidocaine with 1:1,00,000 epinephrine.
  - A full-thickness skin graft is harvested from the groin area (~2 cm × 6 cm).
  - The soft tissue is closed with interrupted 4-0 mersilene or Vicryl sutures.
  - The subcuticular layer is closed with a running 4-0 Vicryl or 5-0 monocryl suture.
  - Steri-Strips are then applied.
  - The skin graft is then placed in betadine and then in normal saline with antibiotic solution.
- Elevation of framework
  - The auricular incision is then made from the superior helix to the lobule.
  - The ear is undermined anteriorly to approximately half of the

framework with the tenotomy scissor or needlepoint cautery with care to avoid exposure of the cartilage. A moist sterile gauze is then placed over the wound.

- Projection of the ear can be accentuated with a wedge implant. This can be constructed from costochondral rib harvested and banked during the first stage or from a porous polyethylene wedge implant. Care should be taken to ensure that the wedge implant is fully covered prior to skin grafting. This can be accomplished either by the creation of a tunneled pocket in the post-auricular sulcus, or by the elevation of an anteriorly based temporo-occipital flap that can be rolled anteriorly to cover the wedge implant. The implant is totally covered and secured with interrupted 4-0 mersilene sutures.
- The posterior skin edges are then advanced anteriorly and anchored to the mastoid periosteum with 4-0 mersilene sutures. The full-thickness skin graft is then placed on the undersurface of the elevated framework, and the skin edges are closed with interrupted 6-0 prolene sutures or absorbable sutures, depending on the surgeon's preference. A sterile sponge or xeroform gauze is lightly applied as a bolster over the skin graft and secured with interrupted 4-0 prolene sutures.
- Antibiotic ointment and a telfa dressing is then placed over the ear.
- An ear dressing is then applied without pressure.

Stage IV—(Only If Using the Four-Stage Technique) Tragus Formation (2 to 3 Months After the Third Stage)

If tragus is constructed in stage I, then a fourth stage may be avoided by the microtia surgeon. However, if patient is a candidate for aural atresiaplasty, the following can be performed to accentuate the tragus at the time of the canaloplasty.

- An anteriorly based tragus flap is outlined by marking out a curvilinear incision in the conchal bowl just posterior to the tragus.
- The proposed incision is injected with 1% lidocaine with epinephrine 1:100,000. The incision is made with a 15-blade.

- An anteriorly based skin flap is elevated superficial to the tragal cartilage (if present).
- Dissection deep to the tragal cartilage is performed.
- The anteriorly based flap is wrapped around the tragal cartilage and secured to the underlying soft-tissue with buried absorbable sutures.
- If performed with canaloplasty, the skin edges are then secured to the split-thickness skin graft harvested for the canal reconstruction (see chapter on aural atresia).
- If not performed with canaloplasty, a full-thickness skin graft may be utilized from the contralateral postauricular skin to address the donor site defect in the conchal bowl.

Common Errors in Technique

1. Rough handling of the cartilage: If the electrocautery is too close to the cartilage during rib removal, this can cause thermal injury that may become apparent later with eventual resorption of injured cartilage.

2. Skin pocket thickness: This is one of the most important parts of the reconstruction. If the skin pocket is too thick, this will not allow the skin to develop good definition over the cartilaginous framework secondary to thickness. If the skin pocket is too thin, this can cause ischemia and necrosis of the skin with subsequent exposure of the cartilage.

3. Lack of postoperative care: The ear must be cared for very meticulously for 4 to 6 months after surgery. The patient can resume normal activities, but use of the ear cup (during sleep) without pressure is very important to allow the skin to adhere to the cartilaginous framework without constant pressure on the skin.

FIG. 207.6 Patient A: Preoperative grade III microtia *(left)* and postoperative view after completing all stages of total Auricular reconstruction. Patient B: with right microtia and atresea and following reconstruction.

Postoperative Period

Postoperative Management

1. Wrap the head to protect the pinna. Should wear initial head-wrap until postoperative visit in 1 week and then at night thereafter.

2. Pain medication: When managed by an epidural injection or a paravertebral nerve block, the pain after the first stage is usually quite minimal. Acetaminophen or ibuprofen may be administered as first-line treatment for pain. Narcotic pain medication may be used for breakthrough pain. Patients should be expected to have less pain in subsequent stages. Pain beyond expectation in the early postoperative period may indicate hematoma or early infection.

3. Parents are instructed on drain management and are expected to

record outputs of drains. Drains will be removed at the 1-week postoperative visit.

4. Postoperative photodocumentation (Fig. 207.6).

Complications

Short term:

1. Pneumothorax during rib cartilage harvest can occur. See chapter on cartilage harvest.

2. Seroma, hematoma, or wound infection—This may require needle aspiration or incision and drainage. Any purulence should be cultured, and appropriate antibiotic management prescribed.

3. Exposure of cartilage framework—If skin breakdown occurs over the cartilage framework, the exposed cartilage should be débrided back to healthy, white cartilage. If the area is small, the skin may re-epithelialize over the area of breakdown. Antibiotic ointment may be used to cover this area to keep it moist and clean. If re-epithelialization does not occur, this exposed cartilage will need to be covered with either a local flap or a temporalis flap and skin grafts.

Long term:

1. Unsatisfactory cosmetic result—Realistic patient expectations coupled with a well-executed surgical plan are keys to prevention. If revision surgery is required, it is possible to undergo repeat cartilage surgery, placement of a prosthetic, or reconstruction with an alloplastic implant (if the temporoparietal flap has not been previously compromised).

2. Chest-wall deformity (rare) —It is best to prevent this by retracting muscles rather than splitting them.

Alternative Management Plan

1. Watchful waiting.

2. Prosthetic auricle—A silicone-based prosthesis may be fashioned by an anaplastologist. This may be fixated with tape, glue, or surgically implanted anchors. It may require surgical removal of the microtic ear in

order to allow for a proper fit.

3. Costochondral graft with fewer surgical stages: “Nagata technique.”

4. Reconstruction with an alloplastic implant. The implant is covered by a temporoparietal flap and skin grafts.

Discussion

Evidence-Based Medicine Question

What is the earliest age that microtia reconstruction should be initiated?

The optimal age for microtia reconstruction is dependent upon both psychosocial and physical factors. Completing all of the stages of surgery prior to entry into primary school is often desired. However, it is often not feasible, as the eighth rib length should ideally measure close to 6 to 8 cm in order to fashion the helical rim from one piece of cartilage.

In an effort to identify the normal growth curve of costochondral cartilage in children, Andreoli et al.[1] reviewed 360 chest CT scans in children aged 3 to 20 years. Rib cartilage growth was found to be nearly linear in childhood, with the height of ribs 6 to 8 approaching adult size by 8 years of age. In that study, rib size was consistently larger in males and on the left side. At age 6, rib 8 measured 6.33 cm ± 1.01 cm and increased to 8.95 cm ± 1.99 cm at age 8.

In children who are at or above average on their growth charts, it may be feasible to proceed with stage I of surgery closer to age 6. Keeping this in mind, for children who are small for their gestational age, waiting until 7 to 8 years of age may be reasonable.

Editorial Comment

Microtia reconstruction is part art and part science. Few other surgeries in the head and neck require such attention to detail both in sculpting the cartilaginous framework and in careful handling of the soft tissue.

This chapter outlines the steps used for total auricular reconstruction. In the future, technological advances may allow for other methods for autologous cartilage reconstruction using 3D printing of complete

cartilage frameworks, bio-scaffolds for cartilage ingrowth, or some combination of these. Until then, some variation of the above multi-stage technique remains the standard for total auricular reconstruction worldwide. Surgeons and their patients should be fully aware that results can vary significantly between surgeons, and even for high-volume microtia surgeons with consistent outcomes, results may vary from patient to patient. Nevertheless, cosmetically pleasing results have been achieved with consistency using the above technique.

Review Questions

1. The most common option worldwide for correction of microtia is:

   a. Prosthetic

   b. **Costochondral graft**

   c. Watchful waiting

   d. Alloplastic implant

2. A possible early complication from rib cartilage harvest for stage I microtia reconstruction include all of the following, *except*:

   a. Hematoma

   b. Wound infection

   c. Pneumothorax

   d. **Chest wall deformity**

3. A microtic ear with structural deficiencies, but recognizable anatomy, may be described as:

   a. Grade I microtia

   b. **Grade II microtia**

   c. Grade III microtia

   d. Grade IV microtia

Congenital and Acquired Atresia and Stenosis of the External Auditory Canal

Robert Yellon

Introduction

In the management of congenital aural atresia (CAA) and congenital external auditory canal stenosis (CEACS), the surgical challenge arises from anatomic variation and absence of standard landmarks. The incidence of microtia/CAA is approximately 1 in 10,000. In a large series, 58% of cases of microtia were right-sided, 32% left-sided, and 9% bilateral. Frequently associated anomalies include facial asymmetry, seventh nerve weakness, cleft lip/palate, urogenital anomalies, and cardiovascular anomalies.

The etiology of microtia/CAA includes in utero ischemia with obliteration of the stapedial artery, increasing maternal age, and chromosomal aberrations. Teratogens for microtia/CAA include thalidomide, isotretinoin, vincristine, and colchicine. Syndromes with microtia/CAA/CEACS include oculoauriculovertebral spectrum and Treacher-Collins syndrome. Oculoauriculovertebral spectrum may include cardiac, cervical spine, auricular, ocular, and renal anomalies. Such patients require ophthalmologic, genetic, and dental/craniofacial consultation. Associated airway and feeding problems require treatment.

Parents are educated that the two important factors are early improvement of hearing and later optimal cosmesis. The plan for reconstruction of both the auricle and CAA will require staged surgeries. Parents should be educated about options for microtia reconstruction, as well as BAHA (Cochlear, Centennial, Colorado), Ponto (Oticon, Askim, Sweden), Sophono (Boulder, Colorado), Vibrant Soundbridge middle ear implants (Cochlear), and Softbands. Possible complications of the surgeries are discussed.

Acquired external auditory canal atresia (AEACA), which results from inflammation, infection, trauma, or surgery will also be discussed.

Key Operative Learning Points

a. Patients with CAA have maximal (60 dB) conductive hearing loss (CHL) but rarely sensorineural hearing loss (SNHL). Behavioral testing, otoacoustic emissions, and auditory brainstem response (ABR) may be needed to determine hearing thresholds.

b. Hearing rehabilitation is more important for bilateral CAA/CEACS than for unilateral cases. However, unilateral CAA/CEACS can cause speech and school difficulties.[1]

c. Grading systems including the Yeakley and Jahrsdoerfer[2] and modified Dedhia et al.[3] systems for grading of computed tomography (CT) of the temporal bone help determine which patients are candidates for atresiaplasty based on anatomy.

d. Surgery for hearing should be coordinated with a microtia surgeon to develop a plan that considers all hearing and cosmetic options.[4]

e. Some surgeons combine stages of microtia reconstruction with atresiaplasty.

f. Atresiaplasty can be performed with anterior (lateral) or canal wall-down techniques. Anterior (lateral) technique is preferred to avoid mastoid bowl issues.

g. CEACS must be followed closely with serial CTs, even if no surgery is initially planned, to watch for possible canal cholesteatoma.

h. Complications of atresiaplasty may include external auditory canal (EAC) stenosis, recurrent infections, lateralization of the tympanic membrane (TM), persistent CHL, and, rarely, facial nerve injury and SNHL.[4]

Preoperative Period

History

CAA/CEACS

A consult for a patient with microtia and CAA/CEACS is often requested shortly after birth. A history of airway, feeding, or other potentially life-threatening issues should be determined, as well as familial microtia/CAA or intrauterine teratogen exposure. A history of school and speech problems is important for older children.[1]

AEACA

AEACA usually involves soft tissue but occasionally bony obliteration of the EAC. The common pathway in AEACA is a history of exuberant fibroproliferative inflammation. Causes of AEACA include chronic otitis externa, chronic suppurative otitis media, fractures or burns of the EAC, tympanomastoid surgery, or chronic dermatitis.

Physical Examination

CAA/CEACS

A physical examination should be performed with special attention to the ears. CAA versus CEACS, syndromic appearance, and airway, feeding, and cardiac status are evaluated. Microtia is graded as follows: grade 1, nearly normal ear with some minor anomaly; grade 2, an ear with moderate structural deficiencies; grade 3, classic severe "peanut deformity" (Fig. 208.1); and grade 4, anotia or no auricle and earlobe.

CEACS should be débrided while restraining the child using a microscope, if possible, to examine the EAC and TM.

Ongoing evaluations are important since otitis media occurs in higher frequency in the normal ear than in the general population. Tympanostomy is performed if indicated. The child is examined every 6 to 12 months or more frequently, if necessary.

AEACA

The debris in the ear canal should be suctioned and cultured. The presence of ongoing inflammation versus mature scar in the EAC is determined.

Imaging

CAA/CEACS

For CAA/CEACS, high resolution CT of the temporal bones, in both axial and coronal planes, is obtained at 5 years to evaluate the anatomy for atresiaplasty and to rule out cholesteatoma. The incidence of congenital cholesteatoma in CAA/CEACS is 0% to 7%. Even if no surgery is planned, an initial CT should be obtained, as well as a later CT to rule out cholesteatoma not initially evident.

CAA/CEACS––Grading Systems of Favorability for Atresiaplasty

Candidacy for reconstruction of CAA/CEACS is dependent on the anatomy. Yeakley and Jahrsdoerfer[2,4] devised a grading system to evaluate CT of the temporal bone and auricle to identify favorable candidates for atresiaplasty.

Each favorable factor is awarded one point (Table 208.1). A score of <6 indicates that the patient is not a candidate for atresiaplasty, while ≥6 indicates a favorable candidate. The higher the total number, the more likely a good hearing result after atresiaplasty.

A normal stapes is the only factor awarded two points, while an anomalous stapes is awarded one point. An absent stapes receives no points. If no stapes or oval window (OW) can be identified on CT or intraoperatively, the procedure should be declined or aborted, respectively.

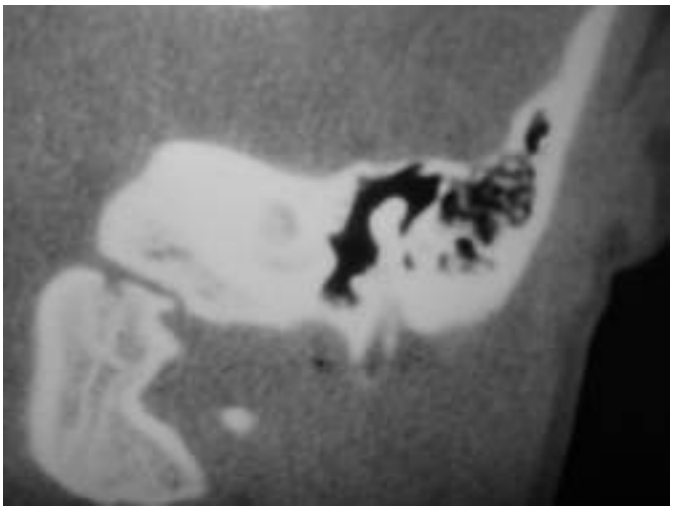

FIG. 208.2 Coronal CT of left temporal bone with congenital aural atresia. Note high tegmen mastoideum, well-pneumatized mastoid and middle ear, and malleus attached to atretic plate.

TABLE 208.2

Modified Jahrsdoerfer Grading System for Computed Tomography of Congenital Aural Atresia/Congenital External Auditory Canal Stenosis

Anatomic Structure	Points
Stapes normal or abnormal but present	2 or 1
Oval window open	1
Middle ear well pneumatized	1
Malleus/incus well formed	1
Incudostapedial joint intact	1
Mastoid well pneumatized	1
Round window open	1
Auricle normal	1
Tegmen mastoideum normal or mildly low	2 or 1
Malleus–incus versus stapes position normal	1
Facial N. at oval window normal	1
Facial N. posterior (not lateral) to middle ear	1
Maximum total	14

A well-pneumatized middle ear space is associated with better hearing outcomes. The position of the facial nerve is critical. When favorable, the facial nerve lies superior to the OW in its horizontal portion and then courses inferiorly at the second genu to pass inferiorly through the mastoid cavity. When unfavorable, the facial nerve may totally or partially cover the OW/stapes, thus precluding a surgical approach to the window. A second possible anomaly in CAA is that the facial nerve may pass anterolaterally at the second genu, rather than inferiorly. Thus, the facial nerve crosses lateral to the middle ear and may be injured during an anterior (lateral) surgical approach.

In CAA, it is very common to find a fused malleus–incus complex (MIC), which is fixed to the bony atretic plate (Fig. 208.2). It is favorable when the MIC is well formed and not hypoplastic. A normal incudostapedial joint on CT is also favorable. The presence of a round window is favorable because obliteration impairs sound

energy delivery into the cochlea. A normal auricle is awarded a point because it is formed earlier during embryogenesis than the middle ear, and this usually suggests less middle ear deformity.

Dedhia et al.[3] described useful modifications of the Jahrsdoerfer grading system for atresiaplasty (Table 208.2). New and/or modified anatomic considerations and their respective incidences in CAA CTs included the presence of (1) moderately low-lying tegmen mastoideum (13%); (2) severely low-lying tegmen mastoideum (4%); (3) MIC large and positioned directly lateral to stapes rather than normal anterolateral position (24%); (4) facial nerve obstructing OW (41%); and (5) facial nerve turning anterolateral (21%).

The anterior (lateral) approach to the middle/attic may be more difficult yet still possible if the tegmen mastoideum is mildly low; however, a severely low-lying tegmen precludes atresiaplasty. A large MIC that is directly lateral to the stapes will block access to the incudostapedial joint and stapes, making it difficult or impossible to assess incudostapedial joint discontinuity and/or stapes fixation, which may result in persistent CHL. Presence of these anomalies may make atresiaplasty impossible or more difficult.

In the usual setting of bilateral chronic ear disease, the worse hearing ear is traditionally operated on first. In contrast, in bilateral CAA/CEACS, the ear with the most favorable anatomy is selected first to maximize chances for a good hearing outcome while minimizing risks.

AEACA

CT imaging is helpful in differentiating bony from soft tissue atresia, detecting cholesteatoma, and assessing the mastoid, middle ear, and ossicles.

Indications

Unilateral Versus Bilateral CAA/CEACS

With bilateral CAA/CEACS and CHL, there is greater need to provide hearing rehabilitation than for unilateral cases. The need for hearing rehabilitation for unilateral CAA/CEACS is more controversial, and some argue that there are risks and that gains are smaller than for

bilateral cases.

In the past, for unilateral CAA, no intervention was recommended other than preferential seating and close monitoring of the normal ear. Recently, up to 43% of children with unilateral CAA were shown to have school problems and require extra services, including speech therapy and educational intervention programs.[1] Rehabilitation should be offered to children with language or school difficulties, but otherwise some wait for a decision by the child when older. For unilateral CAA/CEACS, binaural hearing, improved sound localization, and optimization of hearing in noise are desirable.

CEACS

Schuknecht described the type A anomaly as isolated meatal stenosis, which is easiest to repair. Canal cholesteatoma may develop. Middle ear anatomy is fairly normal. The Lempert endaural approach (described later) is used for severe stenosis.

The type B anomaly is more extensive CEACS affecting the entire EAC. Middle ear anomalies are more common. Canaloplasty/atresiaplasty is performed if narrowing is severe, or if there is canal cholesteatoma, or significant CHL (dependent on CT grading). The incidence of type A and B anomalies is approximately equal. Yellon observed that 50% of cases of CEACS will have a partial atretic plate, hypoplastic TM, and/or ossicular anomalies. Jahrsdoerfer and Chole reported a 50% incidence of canal cholesteatoma by age 20 with EAC diameter <4 mm. It is likely that some of these cases were untreated as children. A neonate with an EAC diameter of ≥2.5 mm who is examined and débrided in the office or operating room every 6 months will often outgrow the problem after 4 to 5 years. Canal cholesteatoma is much more likely when the EAC is ≤2 mm. Frequently cerumen occludes the CEACS causing CHL. Examination of the ear by a non-otolaryngologist will be difficult if not impossible, and pathology may go undetected.

AEACA

CHL is the indication for repair of AEACA.

Contraindications

CAA/CEACS

Any degree of SNHL that is more than mild will preclude atresiaplasty. Any anomaly of the inner ear precludes atresiaplasty because of an increased incidence of SNHL following surgery.

AEACA

Inflammatory processes must be resolved prior to surgical repair.

Preoperative Preparation

Alternatives for Hearing Rehabilitation in CAA/CEACS

Nonsurgical Devices

Children with bilateral CAA/CEACS or selected cases of unilateral CAA/CEACS may be fitted with a sound processor clipped to a Velcro headband (Softband) during the first year of life. Devices include the BAHA, Ponto, and Sophono sound processors with headbands. These devices may also be used as a trial prior to implantation.

The bone conduction hearing aid with metal headband is a less expensive option. A hearing aid is an option with a normal auricle.

Timing and Sequence of Surgeries for Microtia/CAA/CEACS.

CAA usually occurs with microtia (see Fig. 208.1), although there are occasional cases without microtia. When associated with microtia, CAA reconstruction may be undertaken before, after, or in combination with microtia reconstruction. Most surgeons advocate for atresiaplasty after microtia reconstruction. Previous operations may compromise blood supply and decrease success of cartilage implantation.

In contrast, one group reported a series of early atresiaplasties followed by later microtia reconstruction using Medpor implants with temporoparietal flaps. Another group reported on 1460 ears that had canal wall-down atresiaplasty at the time of microtia

reconstruction with rib graft, as a combined first stage of reconstruction.

Optimal age to begin microtia reconstruction is generally considered ≥7 years. Proponents for early reconstruction argue for minimizing psychologic trauma. Proponents for later reconstruction argue that better cosmetic results are obtained when rib cartilage is larger, and that older pediatric patients are more cooperative.

Proponents of early atresiaplasty contend that acquisition of binaural hearing, sound localization, and improved ability to hear sound in noise are beneficial. Proponents for late atresiaplasty believe the decision should be delayed until the patient understands risks.

For the occasional case of CAA without microtia and for isolated CEACS, atresiaplasty may be performed at ≥4 years if otitis media has resolved.

AEACA

In the early phase, aggressive cleaning and ototopical corticosteroid-antimicrobial drops control infection and minimize granulation tissue. Wicks help in the delivery of ototopical drops and act as a stent. Cultures are helpful. Active dermatitis does not provide a good environment for successful reconstruction.

Once mature fibrosis is present, CHL is the concern. Amplification is offered. An osseointegrated implant is considered for patients who decline atresiaplasty or are unable to use a conventional hearing aid.

Operative Period

Anesthesia

General anesthesia required. Neuromuscular blockade contraindicated

Positioning

Since surgery may last 3 to 6 hours, padding must be used to avoid

pressure sores.

Perioperative Antibiotic Prophylaxis

Antimicrobials are administered for *Staphylococcus* and *Pseudomonas* species.

Monitoring

Facial nerve monitoring required

Instruments and Equipment to Have Available

Tympanomastoidectomy set, ossiculoplasty prostheses, facial nerve stimulator, ototelescopes, laser, Silastic sheet, and Merocel (Mystic, Connecticut) packing should all be available.

Key Anatomic Landmarks

CAA

- The more anterior or toward the temporomandibular joint (TMJ) and superior (toward the dura) one drills, the safer it is because this area is usually furthest from the facial nerve. There may be multiple tiny pits or a vestige of the tympanic portion of the temporal bone (cribriform area) that are landmarks used to begin drilling.[4] Three-dimensional CT can help define the location to begin drilling.
- The middle fossa dura is a very useful landmark, but dural exposure is avoided. Drilling continues medially until the thin bony atretic plate and opening into the attic are identified. Entry is into the attic rather than middle ear to find the MIC. The fused MIC is usually partially fixed to the bony atretic plate (see Fig. 208.2).
- It is important to know whether (1) the MIC is large and positioned directly lateral to stapes rather than the normal anterolateral position; (2) the facial nerve is obstructing the OW; and (3) the facial

nerve turns anterolateral and is at risk from anterior (lateral) surgical approach.

Ideally, the EAC and bony annulus should be widened up to 15 mm; however, this is often limited by dura, TMJ, facial nerve, or mastoid air cells.

Prerequisite Skills

Extensive experience with tympanoplasty, mastoidectomy, ossicular reconstruction, stapedectomy, atresiaplasty, and some knowledge of microtia reconstruction is required.

Operative Risks

Injury to the dura, TMJ, and facial nerve must be avoided. Avoid drill trauma to ossicles during separation from and removal of the atretic plate.

Surgical Technique

CAA

Atresiaplasty via canal wall-down mastoidectomy was advocated by earlier surgeons but fell out of favor due to poorer hearing results and possibility of mastoid cavity problems. Recently, acceptable hearing results with canal wall-down atresiaplasties have been reported (discussed later).

A majority of surgeons favor the anterior (lateral) approach as described by Jahrsdoerfer. A postauricular incision is made, and the reconstructed auricle is elevated in the plane of the temporalis fascia. Care is taken to leave perichondrium on the auricular graft and to preserve its anterior blood supply. An incision is made through the temporalis fascia. Soft tissue is elevated and the zygomatic root, linea temporalis, and TMJ are identified.

Drilling begins as described in the Key Anatomic Landmarks section provided previously. The middle fossa dura is a useful landmark. Drilling continues medially until the thin bony atretic plate and

opening into the attic are identified. An angled telescope is used to identify ossicles through an opening in the atretic plate. The fused MIC is usually partially fixed to the bony atretic plate, and excessive drill energy may be transmitted. Diamond burs are used to thin the atretic plate to eggshell thickness, and then it is gently removed with picks and curets. When mobilizing a fixed ossicle, it is important to remove significant bone near the fixation site, lest new bone and fibrosis cause recurrent fixation. The CO_2 laser is very helpful for removal of bone. The MIC should be widely exposed (Fig. 208.3). Successful use of CT-based image guidance navigation for atresiaplasty has been reported.

Ossicular anatomy is quite variable in CAA. In congenital CHL, the stapes may be fixed in 4% of cases. The full armamentarium of ossiculoplasty techniques may be required. If stapes surgery is required, it is preferable as a second stage procedure after complete healing.

If the MIC is large and directly lateral to the stapes, it is more difficult to assess the mobility of the stapes and incudostapedial joint. In such cases, the MIC is left in situ and the temporalis fascia graft is placed directly over the MIC to create the TM.

The EAC should be 15 mm in diameter; however, this is often limited by dura, TMJ, facial nerve, or mastoid air cells. Most reconstructed EACs undergo postoperative narrowing, especially at the meatus.

Temporalis fascia is used to reconstruct the TM. A split-thickness skin graft is used to line the EAC. Jahrsdoerfer recommended placing a small disc of thick Silastic over the temporalis fascia graft and the partially overlapping skin graft to prevent lateralization (Fig. 208.4). Merocel packing coated with bacitracin is placed and expanded with ofloxin drops.

FIG. 208.3 View of malleus–incus complex during atresiaplasty.

A large external auditory meatus is created by excising a disc of tissue from the reconstructed auricle after a pedicled skin flap has been preserved. The external auditory meatus and the bone of the EAC are beveled to create a smooth transition. The reconstructed auricle is then replaced in position. The skin graft is brought out through the external auditory meatus and sutured to the skin and flap from the meatus. More packing is placed.

Combined Microtia and Atresiaplasty

Surgeons have combined microtia reconstruction with atresiaplasty. Seigert developed a three-stage technique for complete reconstruction of microtia and CAA. Cho and Lee developed a two-stage microtia reconstruction with atresiaplasty. Yellon reported that atresiaplasty may be combined with tragal reconstruction following microtia reconstruction (Fig. 208.5).

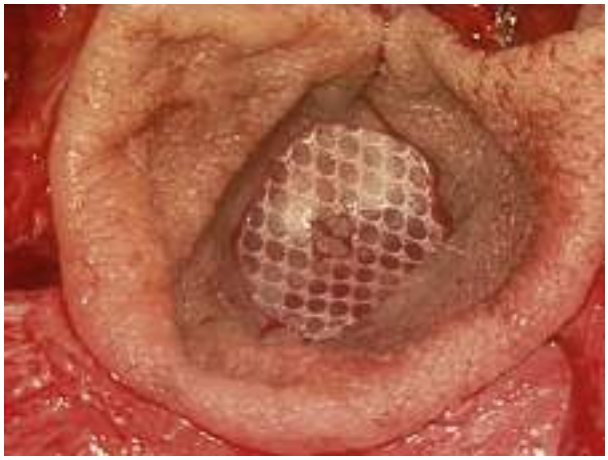

FIG. 208.4 External auditory canal lined with split-thickness skin graft and Silastic disc over temporalis fascia graft.

FIG. 208.5 Final result for reconstruction of microtia with rib grafts and atresiaplasty.

CEACS

For CEACS, the endaural approach as described by Lempert is preferred, although some recommend a postauricular approach. The first incision is in the incisura (between the root of helix and tragus).

Externally, the incision is extended superiorly just anterior to the root of the helix. Temporalis fascia is harvested from this incision. In the superior EAC, this incision is extended medially just past the hair-bearing skin at the bony-cartilaginous junction. Anterior and posterior canal incisions are made from this point to create two triangular flaps that are back-elevated. Self-retaining retractors hold the flaps and improve exposure.

The tympanomeatal flap is elevated, and the TM is elevated from superior to inferior. In severe cases, the EAC is so narrow that drilling must be performed before the tympanomeatal flap can be injected with epinephrine and elevated. Canal cholesteatoma and bone erosion may be present. The bony EAC is drilled to enlarge it, while avoiding the dura, TMJ, and mastoid air cells. If a partial atretic plate is attached to the MIC, the plate is removed as for CAA, as described previously. Ossiculoplasty is performed if indicated. Removal of the partial atretic plate and enlargement of the bony annulus necessitates placing an underlay fascia graft to enlarge the hypoplastic TM.

If the area of exposed bone in the EAC is moderate, for example, 50% of the circumference of the EAC, then a thin full-thickness skin graft is used. If exposed bone is extensive/circumferential, then a split-thickness skin graft is required since full-thickness skin is too bulky.

The two lateral triangular flaps are thinned and replaced in the EAC. Merocel sponges are packed, as described previously.

AEACA

Goals of surgery are to remove the fibrosis, expose the TM, and re-epithelialize the EAC with healthy skin. After epinephrine injection, a circumferential incision is made at the junction of the normal medial EAC skin and the lateral aspect of the stenosis/atresia. A postauricular approach is performed for wide exposure and the auricle is elevated forward. Ear canal skin and fibrous tissue are elevated off the bony EAC. This dissection proceeds medially until the TM is identified. There is usually a plane between the EAC scar and the fibrous layer of the TM. The drill is used to enlarge the EAC in cases of bony atresia. The goal of canaloplasty is to view the entire TM through the external auditory meatus. Middle ear exploration is

advised if preoperative CHL is >20 to 30 dB, expected for AEACA alone.

Generally, little skin can be salvaged from the canal because of fibrosis. Therefore, a skin graft is required, as described previously for CAA. The EAC is packed and managed as described for CAA.

Common Errors in Technique

CAA/CEACS

A planned anterior (lateral) approach may require conversion to a canal wall-down procedure due to drilling into mastoid air cells. Small openings are repaired with fascia and/or cartilage.

If no stapes can be identified intraoperatively, the procedure should be aborted.

Make sure that the surgeon's hands are braced during freeing the MIC from the atretic plate to avoid subluxation.

Make the EAC as wide as possible to decrease stenosis.

Postoperative Period

Postoperative Management

CAA/CEACS and AEACA

The packing and Silastic are removed after 8 to 12 days. Ototopical antimicrobial/corticosteroid drops are used for 6 weeks.

Infections should be suctioned, cultured, and treated aggressively with ototopical and oral/IV antimicrobials if indicated.

The reconstructed EAC may require periodic débridement.

Complications

Complications of Atresiaplasty

Following atresiaplasty, stenosis is the most common complication (0%

to 25%) and most common indication for revision surgery. Triamcinolone injection into the meatus at surgery or subsequently may prevent or improve stenosis.[4] Lining the meatus with a pedicled full-thickness skin graft can decrease stenosis. Wicks, stents, and molds decrease or prevent stenosis and may be required for 6 months.

Revision atresiaplasty for CHL may be required. In a systematic review, the average hearing gain for atresiaplasty was 24 dB (516 ears), while the average gain for percutaneous osseointegrated implants was 38 dB (100 ears).[5] The TM becomes lateralized and requires revision atresiaplasty for CHL in 0% to 18% of cases. Although cosmetically undesirable, BAHA/Ponto/Sophono surgeries are fast and generally have better hearing and less risk. However, the best possible outcome is an uncomplicated continuous excellent cosmetic and hearing result from atresiaplasty with no requirement for electronic devices.

Facial nerve injury has been reported in 0% to 7% of cases. A higher incidence of injury was associated with a lower Jahrsdoerfer grading score, indicating less favorable anatomy. SNHL has been reported in 0% to 7.5%. It likely occurs from transmission of drill energy to ossicles during removal of the atretic plate. There is often only insignificant high frequency SNHL. Horizontal semicircular canal fenestration or labyrinthotomy is contraindicated and can cause SNHL.

Alternative Management Plan

Alternatives for Hearing Rehabilitation in CAA/CEACS/ AEACA

Nonsurgical Devices

See section “Preoperative Period.”

Implantable Hearing Aids in Children

Several types of implantable devices may be used for CAA/CEACS in children ≥5 years: percutaneous osseointegrated devices (BAHA, Ponto), transcutaneous osseointegrated magnet devices (Sophono, BAHA Attract), and active middle ear implant (Vibrant Soundbridge). In the United States, the minimum age for BAHA,

Ponto, and Sophono is 5 years and 18 years for the Vibrant Soundbridge. In other countries, all are implanted at <5 years.

BAHA/Ponto/Sophono devices are useful for CAA with unfavorable anatomy, poor candidates for a lengthy surgery for medical reasons, or for families that desire improved hearing with less risk. In series of percutaneous BAHAs in children, severe cutaneous complications ranged from 9% to 37%, and loss of implant ranged from 14% to 26%. Transcutaneous magnet-based implants have a much lower complication rate.

The Bonebridge (Med-El, Innsbruck, Austria) is not yet approved in the United States and is usually too large for a child's atretic temporal bone.

Evidence-Based Medicine Question

Systematic review of the literature comparing atresiaplasty versus transcutaneous osseointegrated implants showed that the average hearing gain

a. for atresiaplasty was 38 dB

b. for atresiaplasty was 24 dB

c. for osseointegrated implants was 38 dB

d. for osseointegrated implants was 24 dB

e. b and c

Editorial Comment

The choice for surgery and type of surgery in CAA/CEACS/AEACA depends on the patient's age, hearing, severity of the middle ear/canal malformation, thickness of cortical bone, surgeon's experience, and the choice of the patient/family.

Review Questions

1. In the Jahrsdoerfer grading system, the anatomic structure awarded two points is

   a. Large MIC

   b. Normal facial nerve

   c. Open round window

   d. **Normal stapes**

2. Complications of atresiaplasty include

   a. Facial nerve injury

   b. SNHL

   c. Meatal stenosis

   d. Persistent CHL

   e. **All of the above**

3. Disadvantages of percutaneous osseointegrated implants include all of the following except

   a. Severe skin problems

   b. Loss of implant

   c. Revision surgery

   d. Poor cosmesis

   e. **Persistent CHL**

4. Advantages of atresiaplasty include

   a. Fast surgery

   b. A chance for continuous excellent hearing

   c. Good cosmesis

   d. **b and c**

Otoplasty

Noel Jabbour

Abstract

Obesity is a significant risk factor for the development of many diseases, including respiratory disorders. The current obesity epidemic is largely responsible for the growing number of patients being diagnosed with sleep disordered breathing patterns, whilst other common respiratory conditions, including asthma and COPD, are proving more difficult to manage where obesity is a co-morbidity. There are currently approximately 1.5 million people diagnosed with obstructive sleep apnoea syndrome in the UK,27 although the real figure is likely to be much higher. This poses a substantial and growing economic burden on NHS services and significantly impacts on the quality of life of the sufferer. The effects of obesity on the respiratory system are wide ranging; from the deleterious impact on pulmonary physiology due to the distribution of adipose tissue, to the consequences of circulating pro-inflammatory cytokines and hormone imbalances. Weight loss is often the most crucial aspect in the management of obesity-related lung conditions and more patients are being referred for a surgical assessment for bariatric surgery as the importance of weight loss becomes increasingly recognised. The responsible physician must be aware of the many potential consequences of obesity on respiratory disorders and the specific targets for therapy, to ensure appropriate investigations are arranged and suitable treatments instigated.

Introduction

Auricular deformities are quite common in the general population.

Children with auricular deformities, particularly prominent ears, may be the subject of teasing by peers, which can affect psychosocial development, self-esteem, and school performance. In part, this may be due to how prominent ears draw the eye of the viewer away from the central face and eyes of the subject and toward the auricular deformity. In addition, in popular culture and political cartoons, prominent ears are often used to depict an individual with decreased intelligence.

Otoplasty represents a relatively simple surgical solution with potentially very gratifying results. One challenge for the novice surgeon is that more than 200 techniques have been described in the literature. The goal of corrective surgery is to restore the normal contours and dimensions of the auricle, symmetry, and degree of protrusion from the scalp. Proper analysis of the deformity preoperatively is essential to developing an appropriate surgical plan to optimize results and patient satisfaction.

Key Operative Learning Points

1. Patients generally present with one or both of the following (Fig. 209.1):

   a. Underdevelopment of the antihelical fold

   b. Deep, overly projected conchal bowl

2. The surgical plan seeks to address the previous points by reconstituting an antihelical fold, excising excessive conchal cartilage, and creating a more acute conchomastoid angle (Fig. 209.2).

Preoperative Period

History

1. History of present illness

   a. Most auricular deformities will have been present from birth, but it is important to elicit any changes in ear development or auricular trauma by asking: What did the ear(s) look like at birth? How has the ear changed since then?

b. How bothered is your child by his or her ears? How is it affecting him or her in school or in daycare?

c. Do you have any hearing concerns?

Occasionally a child may present for consideration of otoplasty and may actually have grade I microtia or even aural atresia or external auditory canal stenosis. It is crucial to address hearing concerns.

d. What are your goals for how the ear(s) would ideally look?

2. Past medical history

a. Prior treatment: Did the child have any taping/splinting attempted in infancy? Has the child had any previous auricular surgeries?

b. Medical illness: Does the child have known bleeding disorders?

c. Surgery: Has the child had previous surgeries? Has he or she had any complications from surgery or anesthesia?

d. Family history: Is there a family history of bleeding disorders, connective tissue disorders, or auricular deformities?

e. Ask about medication exposures that may affect bleeding or wound healing, such as:

1) Antiplatelet drugs

2) Herbal products

3) Smoking or smoke exposure

Physical Examination

1. Examination of the auricle: Careful examination and documentation of the auricular anatomy is crucial, including measurement of the auricular dimensions, projection, and degree of development of the conchal bowl and antihelix. Examination of the preauricular area may reveal accessory tragi or sinus tracks that may be addressed concurrently. Gentle pressure on the posterior-superior aspect of the helical rim may be used to recreate an antihelical fold and is useful in assessing preoperatively if this is sufficient to correct the deformity.[1]

2. Otoscopic examination

Examination of the ears with an otoscope may rule out external auditory canal stenosis or atresia.

3. Facial symmetry

Especially in unilateral cases of auricular deformity, the presence of facial asymmetry, hemipalatal paresis, or jaw discrepancy may indicate a need for further assessment for hemifacial microsomia.

Imaging

Imaging is not routinely necessary. Photo documentation is helpful for preoperative planning; potentially for insurance authorization and for medicolegal purposes.

Indications

1. Prominent ear deformity with desire to correct auricular proportions or projection

2. Realistic expectations for surgical outcome

Contraindications

1. Medical comorbidities with increased risk for general anesthesia

2. Significant, uncorrected bleeding disorder or nutritional deficiency that would increase risk for complication with wound healing

3. Unrealistic expectations or psychologic instability

Preoperative Preparation

1. Photo documentation with standard lateral, frontal, and oblique views. A bird's-eye view may be useful to assess conchomastoid angle discrepancies.

2. Discontinue antiplatelet drugs if possible.

FIG. 209.1 Auricular deformity commonly seen in an otoplasty patient.

FIG. 209.2 Typical postoperative view of the auricle after addressing the underdeveloped antihelix and deep conchal bowl, with intentional overcorrection of antihelix.

3. Patients should be counseled on postoperative care and advised on

realistic surgical outcomes, including that mild asymmetry of auricular shape and protrusion is natural and absolutely perfect symmetry is unrealistic.

Operative Period

Anesthesia

General: Although this procedure can be done with local anesthesia in older children and adults, general anesthesia is preferred for patient comfort.

Positioning

Supine: The patient is positioned supine such that both ears may be viewed and accessed during the procedure.

Perioperative Antibiotic Prophylaxis

First-generation cephalosporin

Second-generation cephalosporin

Clindamycin if allergic to penicillin

Monitoring

Routine for general anesthesia

Instruments and Equipment to Have Available

1. Basic surgical set with fine instruments

2. Suture: 5-0 dyed nylon suture, 4-0 clear nylon suture, 4-0 Vicryl suture, 5-0 fast-absorbing suture, or similar

Key Anatomic Landmarks

1. Helix (Fig. 209.3)
2. Antihelix
3. Superior crus and inferior crus of antihelix
4. Scapha
5. Tragus
6. Antitragus
7. Cymba concha
8. Cavum concha
9. Postauricular sulcus

Prerequisite Skills

1. Soft tissue reconstruction techniques
2. Thorough knowledge of normal auricular anatomy

Operative Risks

1. Early complications:
   a. Seroma or hematoma
   b. Wound infection and/or breakdown
2. Late complications:
   a. Recurrence of deformity over time
   b. Asymmetry
   c. Scarring
   d. Other unsatisfactory cosmetic result due to telephone deformity, reverse telephone deformity, cartilage irregularities

Surgical Technique

- Prepare ear and inject proposed area of postauricular incision with 1% lidocaine with epinephrine 1:100,000 (Fig. 209.4).
- Excise postauricular skin—this may vary in size but a fusiform excision measuring no greater than 15 mm in width is often used; the excision is biased toward the posterior auricle so as not to obscure the postauricular sulcus.
- Dissect down to expose the postauricular perichondrium behind the antihelix.
- Use 5-0 nylon suture from anterior surface of ear to temporarily recreate the antihelical fold using temporary placed mattress sutures.[2]
- Cartilage scoring (optional)—Create vertical incision into proposed area of antithetical fold and develop a narrow subperichondrial pocket posteriorly in the proposed area of the antihelical fold. The pocket should be just wide enough to place the smallest rasp to score the cartilage. Alternatively, the beveled edge of an Adson-Brown tissue forceps may be used for cartilage scoring. Care should be made to ensure that all fragments of cartilage are suctioned or expressed out of the pocket.

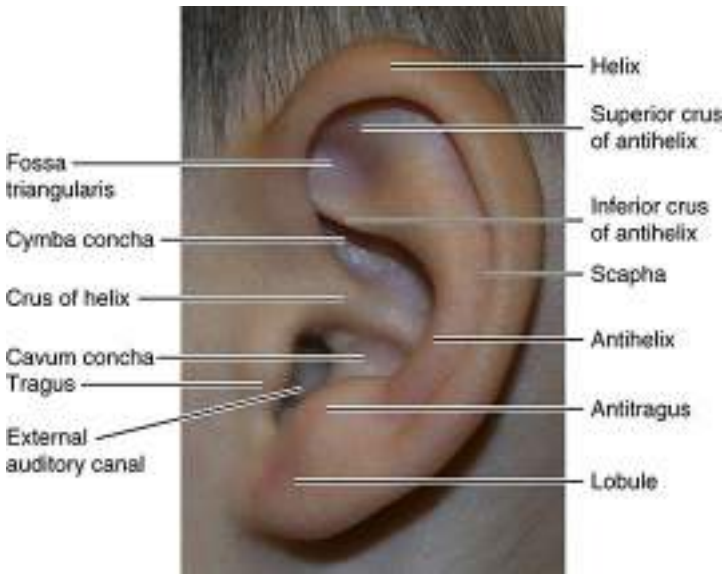

FIG. 209.3 Normal auricular anatomy.

- Place Mustardé sutures from postauricular approach. Full-thickness horizontal mattress sutures using 4-0 undyed nylon suture, or similar,

from the postauricular approach to recreate the antihelical fold. These should be tightened up to and just past the point of creating a natural antihelical fold. Slight overcorrection is necessary to account for some relaxation of the fold with time (see Fig. 209.2). Overcorrection may create unnaturally sharp edges of the antihelical fold.

- Remove anteriorly placed dyed nylon sutures as each Mustardé suture is secured. Three Mustardé sutures are often used.
- One Mustardé suture may used in a similar fashion to recreate the superior crus of the antihelix if needed. Rarely, the inferior crus may need to be defined in a similar fashion.
- Address an excessively deep conchal bowl by excising a small fusiform strip of cartilage from the concha cavum, taking care to avoid injury to the crus of the helix and leaving the perichondrium and the skin of the external auditory canal intact.
- If needed, conchomastoid sutures may be placed in a radial fashion to prevent external auditory canal meatal stenosis. 4-0 clear nylon sutures, or similar, are placed in a mattress fashion from the posterior aspect of the conchal bowl to the premastoid fascia or periosteum. If this suture is placed too far posteriorly, the suture itself may be palpable or even visible and create tenting of the postauricular skin. Placing the sutures in a radial fashion is useful in preventing external auditory canal meatal stenosis.
- Close the deep layer of the incision with 4-0 Vicryl in an interrupted, buried fashion and the superficial layer with 5-0 plain or fast-absorbing suture, or similar.
- If the lobule seems to be overly protruding, a small M-plasty may be fashioned at the inferior aspect of the incision to address the lobule protrusion.
- Apply antibiotic ointment and nonadherent dressing to the incision, fluffs, and a lightly compressive dressing.

Common Errors in Technique

1. Excessive skin resection creating tight closure

2. Creating unnatural contours of the antihelix by overtightening the Mustardé sutures or leaving behind small fragments of cartilage after rasping

3. Undercorrection of lobule and superior aspect of auricle—telephone deformity

4. Overcorrection of lobule and superior aspect of auricle—reverse telephone deformity

5. Asymmetric correction

Postoperative Period

Postoperative Management

1. Wrap head to protect pinna. Should wear initial head-wrap until postoperative visit in 1 week. A less conspicuous head-wrap or headband may be worn thereafter for 2 to 3 weeks to maintain ear position during initial healing.

2. Pain medication: Patients should be expected to have mild pain after this operation. Acetaminophen or ibuprofen may be administered as first-line treatment for pain. Narcotic pain medication may be used for breakthrough pain. Pain beyond expectation in the early postoperative period may indicate a hematoma or early infection.

3. If using a replaceable head-wrap, such as a Glascock dressing, topical antibiotic ointment may be use on the incision for 3 days followed by Aquaphor ointment, thereafter.

4. Postoperative photodocumentation

Complications

1. Seroma or hematoma—may require needle aspiration or opening of incision for drainage

2. Wound infection and/or breakdown—Any purulence should be cultured and appropriate antibiotic management prescribed. A portion of the wound may need to be opened to allow for drainage and healing by

secondary intention.

3. Recurrence of deformity over time—family should be preoperatively counseled regarding this risk and prevention may be achieved by overcorrection

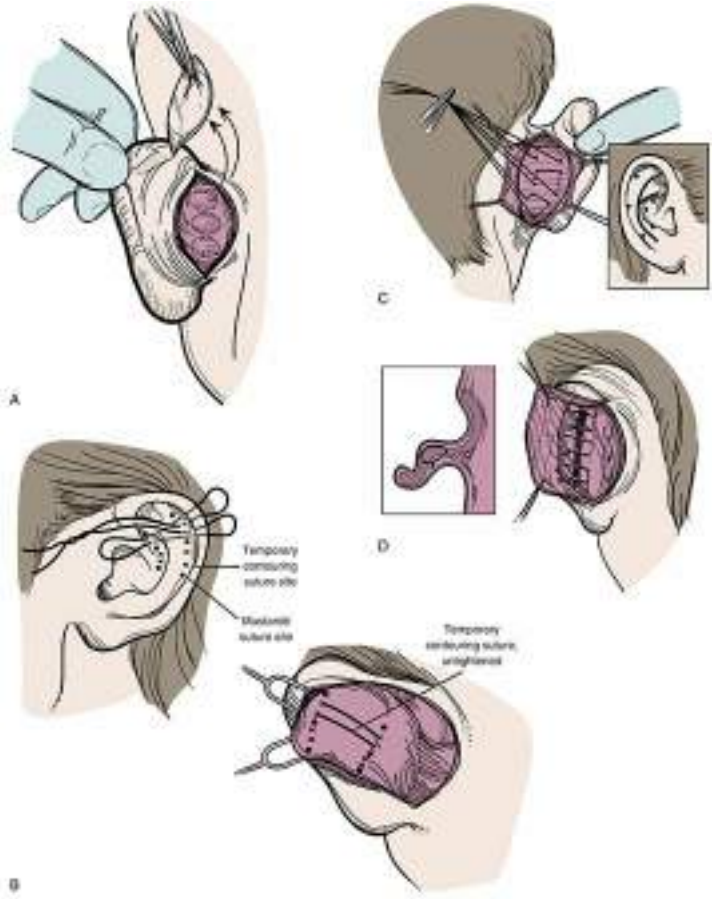

FIG. 209.4 Surgical steps, including excision of postauricular skin in fusiform fashion, **A,** placement of temporary contouring sutures, **B,** and placement of Mustardé horizontal mattress sutures from behind the ear, **C** and **D**.

4. Unsatisfactory cosmetic result—Realistic patient expectations coupled with a well-executed surgical plan are keys to prevention. Revision surgery is rarely needed but may be necessary in select cases.

5. External auditory canal meatal stenosis—Again, prevention is key by checking external auditory canal patency at the conclusion of the procedure and by placing conchomastoid sutures in a radial fashion.

Intraoperatively, if there is concern for stenosis, despite these measures, a canal stent may be placed for 1 week and removed at the first postoperative visit. If stenosis does develop, auditory canal meatoplasty may be necessary.

Alternative Management Plan

1. Watchful waiting
2. Taping and/or molding if initiated in first 3 months of life
3. "Incisionless" otoplasty—detailed in references below

Discussion

Evidence-Based Medicine Question

Should antibiotic prophylaxis be used routinely in otoplasty?

There is little evidence to support or to oppose the use of antibiotic prophylaxis routinely for otoplasty. The rate of postoperative wound infection is quite low in the literature. In 2009 a literature review of complications of otoplasty by Limandjaja et al.[3] demonstrated that few studies report the rate of infection or mention antibiotic prophylaxis. Of the 20 studies between 2000 and 2007 that met the inclusion criteria for review, only one mentioned a wound infection, with a rate of 3.5%; the wound infection rate in the remaining studies was 0%. Of the studies without a reported wound infection, only four explicitly described use of prophylactic antibiotics.

In 2004 a Cochrane review demonstrated that there is no strong evidence to support antibiotic prophylaxis in clean and clean-contaminated ear surgery.[4] Although this review is not specific to otoplasty, auricular reconstruction should be considered clean surgery so long as the ear canal is properly prepped. However, there is likely an underreporting bias in the literature, such that most complications in otoplasty are not reported. Thus, although evidence is limited to support its use, I do use cephalexin by mouth for 7 days following the procedure, in addition to bacitracin ointment on the incision for 3 days.

Editorial Comment

Otoplasty may be challenging techniquely for the surgeon but gratifying for the patient. It restores the natural shape of the ear to create an immediate physical change. Equally important is the psychological impact on a developing child.

This chapter outlines the essential operative techniques in otoplasty. Knowledge of the normal anatomic contours of the ear is crucial for the success of otoplasty.

Like many facial plastic surgery procedures, a variety of described methods exist to accomplish the same goal. A novice surgeon can be overwhelmed by various described techniques. The most significant variations are for marking the antihelix, for cartilage contouring, and for cartilage excision. In my practice, I mark the desired suture locations for the antihelix with needles placed on the anterior aspect of the pinna. Additionally, I tend to avoid any cartilage scoring or cartilage excision, if possible. Over the years, I have begun to slightly overcorrect the auricular deformity with the expectation that, over time, the ears tend to lateralize.

Patients should be pre-operatively counseled that the range of normal is quite broad with regard to the size, shape, and projection of the pinna. The method described above provides a sound approach to achieving the desired patient outcomes and creating a natural, reproducible appearance and symmetry between the ears.

Review Questions

1. Early complications from otoplasty include all of the following, except

   a. Hematoma

   b. Wound infection

   c. **Scarring**

   d. Bleeding

2. Late complications of otoplasty include all of the following, except

   a. Scarring

   b. External auditory canal stenosis

   c. Recurrence of deformity

   d. **Hearing loss**

3. The most common deformities addressed in otoplasty for prominent ears include all of the following, except

   a. **Underdevelopment of the cymba choncha**

   b. Underdevelopment of the antihelical fold

   c. Overdevelopment of the cavum concha

   d. Obtuse conchomatoid angle

instruments and equipment for, 682–683
key anatomic landmarks for, 683
of major sinuses, 682f
monitoring for, 682
operative period in, 682–683

operative risks of, 683
physical examination for, 681
positioning for, 682
postoperative management in, 683
postoperative period in, 683–685
pre-requisite skills for, 683
preoperative period in, 681–682
preoperative preparation for, 682
technique of, 683
Balloon test occlusion (BTO)
for endoscopic petrosal approaches to cranial base, 803
for juvenile angiofibroma, 821
Barbosa, Fairbanks, 270
Barium esophagram
for cervical esophagus cancer, 351, 351f
in partial pharyngectomy, 336
in pharyngectomy, 280
in total laryngopharyngectomy, 124
in transcervical pharyngotomy, 271
for UES dysfunction, 323, 324f
Basal cell carcinoma (BCC)
of head and neck, 1115, 1115f
of lip, 187
Basal cell nevus syndrome, skin cancer of head and neck in, 1112
Basal lamella
in endoscopic ethmoidectomy, 718
of ethmoid bulla and axilla of middle turbinate, 663–664
Base of tongue (BOT), 243

lateral pharyngotomy for, 276f
suprahyoid pharyngotomy for, 273f
early stage cancer of, 271
squamous cell carcinoma of, 277
transoral laser microsurgery of, 243–248.e1
alternative management plans for, 248
anesthesia for, 244
common errors in technique for, 246
complications of, 247, 247f
contraindications to, 244
imaging for, 244
indications for, 244
instruments for, 245, 245f
key anatomic landmarks for, 245–246
monitoring for, 245
physical examination for, 243
positioning for, 244
postoperative management in, 246–247
preoperative antibiotic prophylaxis for, 244–245
preoperative preparation for, 244
prerequisite skills for, 246
risks of, 246
technique for, 246
Base of tongue cancer
transoral and robotic tonsil surgery for, 249–255.e1
alternative management plan for, 254
anesthesia for, 250
common errors in technique for, 254

complications of, 254
contraindications to, 250
imaging for, 250
indications for, 250
instruments and equipment for, 250–251
key anatomic landmarks for, 251
monitoring for, 250
perioperative antibiotic prophylaxis for, 250
physical examination for, 249–250
positioning for, 250
postoperative management in, 254
preoperative preparation for, 250
prerequisite skills for, 251
risks of, 251
surgical technique of, 251
tongue base incisions in, 253–254, 253f–254f
transoral technique for, 251–252, 252f–253f
transoral robotic surgery for, 256–260.e1
alternative management plan for, 260
anesthesia for, 257
common errors in technique for, 259
complications of, 260
contraindications to, 257
imaging for, 256–257
indications for, 257
instruments and equipment for, 258, 258f
key anatomic landmarks for, 258
physical examination for, 256

positioning for, 257, 257f
postoperative management in, 259–260
preoperative antibiotic prophylaxis for, 258
preoperative preparation for, 257
prerequisite skills for, 258
risks of, 258
technique for, 258–259, 258f–259f
Basic transoral robotic surgical skills, in robotic-assisted nasopharyngectomy, 295
Batteries, disk, in external auditory canal, 847
removal of, 849–850
Bell's palsy, facial nerve decompression in, 946, 947f
Belotero, 1102
Bernard-Burrow-Webster flap, in lip reconstruction, 194
Bevacizumab, for recurrent respiratory papillomatosis, 18
Bifrontal craniotomy, for congenital midline nasal masses, 1335
Bilateral choanal atresia, 1325–1326
Bilateral paraseptal transphenoidal approach, to cranial base, 806
Bilateral sagittal split osteotomy, for maxillomandibular advancement for obstructive sleep apnea, 410
Bilateral selective neck dissection, 353
Bilateral vocal fold immobility (BVFI), 52–59.e1
anesthesia for, 54
common errors in technique for, 58
complications of, 58
contraindications to, 54
history of, 52
imaging for, 53

indications for, 54
instruments and equipment for, 54
key anatomical landmarks in, 54
laryngeal electromyography for, 53
neurogenic causes of, 52
operative period in, 54–58
operative risks of, 54–55
perioperative antibiotic prophylaxis for, 54
physical examination for, 52–53
positioning for, 54
postoperative period in, 58
preoperative period in, 52–54
preoperative preparation for, 54
prerequisite skills for, 54
swallowing studies for, 53–54
technique of, 55–58
Bilobed flaps, for nasal reconstruction, 1143–1146, 1146f–1147f
Bimanual palpation, of submandibular gland, 608
Binocular microscopic otoscopy, for ossicular chain reconstruction, 891–892
Biochemical testing, for cerebrospinal fluid leak, 768
Biopsy
of external auditory canal mass, 843, 843b
fine-needle, *See* Fine-needle aspiration biopsy.
of inflammatory granulation tissue in external auditory canal, 861
for juvenile angiofibroma, 821
office-based procedures, laryngeal, 1
in superficial parotidectomy, 614

in transcervical pharyngotomy, 271
transnasal, 4
Bipedicled lining flaps, for nasal reconstruction, 1138, 1140f
Bipolar scissors, in tonsillectomy and tonsillotomy, 1351t
Bleeding, *See* Hemorrhage.
Blepharoplasty, 1069–1077.e1
anesthesia for, 1070
common errors in technique for, 1076
complications of, 1076–1077
contraindications to, 1070
indications for, 1070
key anatomic landmarks for, 1070
lower eyelid
examination for, 1069
indications for, 1070
operative risks of, 1070
transconjunctival (preseptal), 1072, 1072f–1074f
transcutaneous (skin-muscle flap), 1072–1076, 1074f–1076f
operative period in, 1070–1076
operative risks of, 1070
perioperative antibiotic prophylaxis for, 1070
physical examination for, 1069–1070
postoperative management in, 1076
preoperative period in, 1069–1070
preoperative preparation for, 1070
upper eyelid
examination for, 1069
indications for, 1070

operative risks of, 1070
technique of, 1070–1071, 1071f
Blunt trauma, to larynx, 44–45, 44f
Bondy-modified radical mastoidectomy, in mastoid surgery, 916
Bone-anchored hearing devices, *See* Hearing devices, bone-anchored.
Bone graft, calvarial graft and, 1221
Bone resorption, after cranioplasty, 1235f, 1239
Botox cosmetic, 1103–1105
adverse effects, 1106
complications of, 1105–1107
contraindications to, 1103
effect/timeline of, 1103
facial sculpting techniques using, 1105
indications for, 1103
lower face, 1104–1105
upper face, 1104, 1104f
postprocedural care in, 1105
precautions prior to, 1103
preparation/dilution/storage of, 1103
pretreatment planning for, 1103
for ranula, 599
recommended materials for, 1103
technique for, 1103–1104
Botulinum toxin A (BTX A), 1102
for UES dysfunction, 327
Botulinum toxin injections, 1101
for bilateral vocal fold immobility, 57
contraindications to, 2

Brachial plexus, injury to, in radical neck dissection, 456
Brain abscess
after frontal sinus cranialization, 764–765
in cerebrospinal fluid, otorrhea and encephalocele, 999
in otitis media, 877–878
Brain MRI, for hereditary hemorrhagic telangiectasia, 669
Branchial anomalies, 1415
first, 1415–1416, 1416f
surgical technique for, 1419–1420, 1420f
fourth, 1416–1417
surgical technique for, 1421, 1421f
second, 1416, 1417f
surgical technique for, 1420, 1421f
third, 1416
surgical technique for, 1421, 1421f
Branchial cleft cyst, 1415–1422.e1
anesthesia for, 1418
complications of, 1421–1422
contraindications to, 1418
first branchial anomalies in, 1415–1416, 1416f
fourth branchial anomalies in, 1416–1417
history of, 1417
imaging studies for, 1418, 1419f
indications for, 1418
instruments and equipment for, 1418
key anatomic landmarks for, 1418
operative period in, 1418–1421
operative risks of, 1418

perioperative antibiotic prophylaxis for, 1418
physical examination for, 1417
positioning for, 1418
postoperative management of, 1421
postoperative period in, 1421–1422
preoperative assessment for, 1415, 1416f
preoperative period in, 1415–1418
preoperative preparation for, 1418
prerequisite skills for, 1418
second branchial anomalies in, 1416, 1417f
surgical technique for, 1419–1421
third branchial anomalies in, 1416
Branchial sinuses, 1415–1422.e1
anesthesia for, 1418
complications of, 1421–1422
contraindications to, 1418
first branchial anomalies in, 1415–1416, 1416f
fourth branchial anomalies in, 1416–1417
history of, 1417
imaging studies for, 1418, 1419f
indications for, 1418
instruments and equipment for, 1418
key anatomic landmarks for, 1418
operative period in, 1418–1421
operative risks of, 1418
perioperative antibiotic prophylaxis for, 1418
physical examination for, 1417
positioning for, 1418

postoperative management of, 1421
postoperative period in, 1421–1422
preoperative assessment for, 1415, 1416f
preoperative period in, 1415–1418
preoperative preparation for, 1418
prerequisite skills for, 1418
second branchial anomalies in, 1416, 1417f
surgical technique for, 1419–1421
third branchial anomalies in, 1416
Branemark, Per-Ingvar, 1315
Bronchoscopy, 131–136.e1
alternative management plan for, 135
anesthesia for, 133–134, 133f
common errors in technique for, 135, 135f
complications of, 135
contraindications to, 132–133
history of, 131
imaging for, 131
indications for, 131–132, 132f
instruments and equipment for, 132f, 134, 134f
key anatomic landmarks for, 134
monitoring for, 134
operative period in, 133–135
operative risks of, 134
physical examination for, 131
positioning for, 134
postoperative management in, 135
postoperative period in, 135

preoperative antibiotic prophylaxis for, 134
preoperative period in, 131–133
preoperative preparation for, 133
prerequisite skills for, 134
technique of, 134–135
in tracheal resection, 158
Brow lift, 1078–1085.e1, 1079f
alternative management plan for, 1085
anesthesia for, 1080
chemical, 1085
common errors in technique for, 1084
complications of, 1084–1085
contraindications to, 1080
direct, 1081, 1081f
endoscopic, 1082–1083, 1083f–1084f, 1085
hairline incision and coronal, 1081f, 1082
history of, 1078
imaging for, 1079
indications for, 1079–1080
instruments and equipment for, 1080, 1080f
key anatomic landmarks for, 1080
midforehead, 1081–1082, 1081f
operative preparation for, 1080–1084
operative risks of, 1081
perioperative antibiotic prophylaxis for, 1080
physical examination for, 1078–1079, 1080f
position for, 1080
postoperative management in, 1084

preoperative period in, 1078–1080
preoperative preparation for, 1080
technique of, 1081–1083, 1081f
Brow position
asymmetry of, 1085
examination of, 1078, 1080f
Brow ptosis, 1078–1079, 1085
Bubbles, in accessory ostia, 691
Buccal adipose tissue pad technique, for oroantral fistulas, 702
Buccal advancement flap technique, for oroantral fistulas, 701–702
Buccal carcinoma, excision of, 219–226.e1
alternative management plan for, 225
anesthesia for, 220
cheek flap of, 223
complications of, 225
contraindication to, 220
history of, 219
imaging for, 220
indications for, 220
inferior maxilla/masticator space, extension to, 223–224, 223f
instruments and equipment for, 221
key surgical anatomy and clinical implications of, 221–222
management of wound/flap in, 225
mandibulotomy of, 223
neck dissection in, 224
operative period in, 220–224
physical examination for, 219
positioning for, 220

postoperative management in, 225
postoperative period in, 225
preoperative period in, 219–220
preoperative preparation for, 220
prerequisite skills for, 222
reconstruction in, 224, 224t
retromolar trigone/ascending ramus, extension to, 224, 224f
surgical approach in, 223–224
technique of, 223–224
transoral resection of, 223
Buccal mucosa, contraction of, after inferior maxillectomy, 234
Buccal space, 221, 221f, 601, 601f
Buccal space mass, incision of, 601–606.e1
alternative management plan for, 606
anesthesia for, 604
complications of, 606
contraindications to, 603
extended parotid-submandibular incision for, 604f, 605
history of, 601, 602f
imaging/diagnostics for, 602, 603f, 603t
indications for, 603
instruments and equipment for, 605
key anatomic landmarks for, 605
monitoring for, 604
operative period in, 604–606
operative risks of, 605
perioperative antibiotic prophylaxis for, 604
physical examination for, 601–602

positioning for, 604
postoperative management in, 606
postoperative period in, 606
preoperative period in, 601–604
preoperative preparation for, 603–604
prerequisite skills for, 605
rhytidectomy approach for, 605–606
technique for, 605–606
Buccogingival sulcus, incision of, 1277f
See also Gingivobuccal incision
Bunny lines, Botox cosmetic treatment for, 1104
Burns, to facial and oropharyngeal area, after adenoidectomy, 1345
Button hole, facelift and, 1092

C

Calcific tendinitis, 517

Calcitonin, in medullary thyroid carcinoma, 528

Caldwell-Luc operation, *See* Antrostomy, anterior (Caldwell-Luc operation).

imaging for, 351, 351f–352f
indications for, 351
instruments and equipment for, 352
key anatomic landmarks for, 352–353
monitoring for, 352
operative period in, 352–356

perioperative antibiotic prophylaxis for, 352
physical examination for, 350
positioning for, 352
preoperative period in, 350–352
preoperative preparation for, 352, 352b
prerequisite skills for, 353
risks of, 353
staging of, 352b
technique for, 353–356
total laryngopharyngectomy for, 124
Cervical esophagus
cancer of, *See* Cervical esophageal cancer.
penetrating trauma to, surgery for, 329–334.e1
anesthesia for, 330
common errors in technique for, 332–333
complications of, 333
contraindications to, 330
with diversion, 332, 333f
history of, 329
imaging for, 330
indications for, 330
instruments and equipment for, 330–331
key anatomic landmarks for, 331
in large or delayed defects, 332, 332f
management of, 329
medical management of, 329
monitoring for, 330
operative period in, 330–333

operative risks of, 331
perioperative antibiotic prophylaxis for, 330
physical examination for, 329
positioning for, 330
postoperative management of, 333
postoperative period in, 333
preoperative period in, 329–330
preoperative preparation for, 330
prerequisite skills for, 331
in small and early-recognized defects, 331–332, 331f–332f
during special circumstances, 332
surgical management of, 330
Cervical fascia, anatomy of, 514
Cervical lymphadenopathy, presence of, 93
Cervical osteomyelitis, anterior transcervical approach and, 520
Cervical spine
anterior transcervical approach to, 519–526.e1
alternative management plan for, 525
anesthesia for, 521
common errors in technique for, 524
complications of, 524–525
contraindications to, 521
history of, 519
imaging for, 520, 520f
indications for, 520–521, 520f
instruments and equipment for, 521–522
key anatomic landmarks for, 522
monitoring for, 521

operative period in, 521–524
operative risks of, 522
perioperative antibiotic prophylaxis for, 521
physical examination for, 519
positioning for, 521, 522f
postoperative management of, 524–525
postoperative period in, 524–525
preoperative period in, 519–521
preoperative preparation for, 521
prerequisite skills for, 522
technique of, 522–524, 522f–524f
transnasal and transoral approaches to, 826–830.e1
alternative management plan for, 830
anesthesia for, 827
common errors in technique for, 829
complications of, 830
contraindications to, 827
history of, 826
imaging for, 826, 826f
indications for, 826–827, 826f–827f
instruments and equipment for, 827
key anatomic landmarks for, 827
monitoring for, 827
perioperative antibiotic prophylaxis for, 827
physical examination for, 826
positioning for, 827
postoperative management of, 829
preoperative preparation for, 827

prerequisite skills for, 827
risks of, 827–828
technique of, 828
Cervical spondylosis, 520, 520f
Cervical teratoma, after EXIT procedure, 1388f
Cervicofacial flaps, 1192
operative period in, 1192–1194
surgical technique of, 1192–1194
transposition of, 1191–1198.e1
alternative management plan for, 1197–1198
anesthesia for, 1192
antibiotics for, 1192
complications of, 1197
contraindications to, 1192
history of, 1191
imaging for, 1192
indications for, 1192
instruments and equipment for, 1192
monitoring for, 1192
operative period in, 1192
operative risks of, 1192
physical examination for, 1191
positioning for, 1192
postoperative management in, 1197
postoperative period in, 1197–1198
preoperative period in, 1191–1192
Cervicofacial lymphatic malformation, during EXIT procedure, 1388f
Cesarean section, EXIT procedure for, 1389

Cheeks, management of skin cancers in, 1119
Chemical, Botox cosmetic injections of, 1104
Chemical brow lift, 1085
Chemical peels
allergies and, 1096
facial resurfacing with, 1095–1101.e1
alternative management plan for, 1101
common errors in technique for, 1101
complications of, 1101
contraindications to, 1097
deep, 1096
history of, 1095–1096
imaging for, 1096
indications for, 1096
instruments and equipment for, 1097, 1097f
key anatomic landmarks for, 1098
medium, 1096
monitoring for, 1097
perioperative prophylaxis for, 1097
physical examination for, 1096
positioning for, 1097
postoperative management of, 1101
preoperative period in, 1095–1097
preoperative preparation for, 1097
prerequisite skills for, 1098
risks of, 1098
superficial, 1095, 1101
surgical technique of, 1098, 1099f

glycolic acid, 1098
isotretinoin and, 1096
Jessner, 1099
phenol-based, 1095, 1098
salicylic acid, 1098
trichloroacetic acid, 1099
Chemotherapy, radiation therapy in conjunction with, for pharyngectomy, 284
Chest computed tomography (CT), for recurrent respiratory papillomatosis, 1381
Chest radiograph
for endoscopic nasopharyngectomy, 288
in laryngeal cleft repair and laryngotracheal separation, 1373
in maxillary swing/transpalatal/midface degloving with Le Fort I osteotomy approach, 302
in microtia reconstruction, 1469
in modified radical neck dissection, 444
for neural tumors, of parapharyngeal space, 487
for penetrating trauma, 330
in percutaneous tracheostomy, 146
for recurrent respiratory papillomatosis, 1381
in total laryngectomy, 118, 176
in tracheal resection, 157
in transoral CO_2 laser microsurgery, 84
in vertical partial laryngectomy, 100
Chest wall deformity, after rib graft, 1231
Chevalier Jackson sign, 336
Children
cleft palate in, 1459

cochlear implantation in, 1449–1458.e1
laryngeal trauma in, 44
minimally invasive video-assisted thyroidectomy in, 536
tracheocutaneous fistula and depressed scar in, 165
Chlorhexidine wash, for modified radical neck dissection, 445
Choanal atresia, surgical repair of, 1325–1331.e1
alternative management plan for, 1331
anesthesia for, 1327
common errors in technique for, 1330
complications of, 1331
contraindications to, 1327
history of, 1326
imaging for, 1326–1327, 1326f
indications for, 1327
instruments and equipment for, 1327
key anatomic landmarks for, 1327
monitoring for, 1327
operative period in, 1327–1330
operative risks of, 1327
perioperative antibiotic prophylaxis for, 1327
physical examination for, 1326
positioning for, 1327
postoperative management of, 1331
postoperative period in, 1331
preoperative period in, 1325–1327
preoperative preparation for, 1327
prerequisite skills for, 1327
surgical technique for, 1327–1330, 1328f–1330f

Cholesteatoma, 867–868, 872, 882, 890
canal, surgical management of, 860–866.e1, 862f
alternative management plan for, 864
anesthesia for, 861–862
common errors in technique for, 864
complications of, 864
history of, 864
imaging for, 860–861
instruments and equipment for, 862
key anatomic landmarks, 862
physical examination for, 860
positioning for, 862
postoperative management of, 864
preoperative period in, 860–861
prerequisite skills for, 862
risks of, 862
surgical technique for, 862–863, 863f
congenital, 1446
Cholesterol granulomas, of temporal bone, 982–993.e1
alternative management plan for, 993
anesthesia for, 986
audiometry for, 986
common errors in technique for, 991
complications of, 992
contraindications to, 986
histopathology of, 983f
history of, 985–986
imaging for, 986

indications for, 986
instruments and equipment for, 986
monitoring for, 986
operative period in, 986–991
operative risks of, 987
perioperative antibiotic prophylaxis for, 986
physical examination for, 986
positioning for, 986
postoperative period in, 991–993, 992f
preoperative period in, 985–986
preoperative preparation for, 986
prerequisite skills for, 986
surgical technique for, 987–991
Chondronecrosis, after transoral CO_2 laser microsurgery, 90
Chorda tympani nerve, injury to, in cochlear implantation, in adults, 941
Chronic bacterial sinusitis, with biofilm, 627
Chronic otitis media, facial nerve decompression in, 946
Chronic otitis media with effusion (COME), ventilation tube insertion for, 1434
Chronic polypoid corditis, 7
Chronic rhinitis, after surgery of the anterior cranial base, 789
Chronic rhinosinusitis, with polyposis and in-office polypectomy, 628
Chronic sinusitis, adenoidectomy in, 1342
Chyle fistula, after modified radical neck dissection, 448
Cicatricial pemphigoid, 629
Cidofovir, for recurrent respiratory papillomatosis, 18, 1383–1384
Cisternography, of temporal bones, 995
Classic septoplasty, 631

positioning during, 632
surgical technique of, 632–636, 633f–636f
Cleft palate, 1459–1467.e1
classification of, 1460
Pierre Robin sequence and, 1424, 1424f
Cleft palate repair
alternative management plan for, 1467
anesthesia for, 1461
common errors in technique for, 1467
complications of, 1467
contraindications to, 1461
Furlow palatoplasty (double-opposing Z-plasty), 1464–1465, 1464f
history of, 1459–1460
imaging for, 1460
indications for, 1461
instruments and equipment for, 1461
key anatomic landmarks for, 1461, 1462f
operative period in, 1461–1467
operative risks of, 1461–1462
perioperative antibiotic prophylaxis for, 1461
physical examination for, 1460
positioning for, 1461
postoperative management of, 1467
postoperative period in, 1467
preoperative period in, 1459–1461
preoperative preparation for, 1461
prerequisite skills for, 1461
sphincter pharyngoplasty, 1466–1467, 1466f

superiorly based pharyngeal flap, 1465–1466, 1465f
surgical technique of, 1462–1467
two-flap palatoplasty with intravelar veloplasty, 1462–1464, 1463f
Clindamycin
for congenital midline nasal masses, 1334
for hyoid suspension, 396
in pericranial scalp flap, 1165
in vertical partial laryngectomy, 99–106.e1
Coagulation, for hereditary hemorrhagic telangiectasia, 671–672, 671f
Coblation, in tonsillectomy and tonsillotomy, 1351t
Coblation midline glossectomy, *See* Lingual tonsillectomy, Tongue-base reduction, volumetric.
Coblator, lingual tonsillectomy using, 384, 385f, 386
Cobra neck deformity, facelift and, 1092, 1093f
Cochlear implantation
in adults, 938–942.e1
alternative management plan for, 941
anesthesia for, 938
common errors in technique for, 940
complications of, 940–941
contraindications to, 938
history of, 938
imaging for, 938
indications for, 938
instruments and equipment for, 939
key anatomic landmarks for, 939
monitoring for, 939
operative period in, 938–940

operative risks of, 939
physical examination for, 938
positioning for, 938
postoperative management of, 940
postoperative period in, 940–941
preoperative antibiotic prophylaxis for, 939
preoperative period in, 938
preoperative preparation for, 938
prerequisite skills for, 939
surgical technique of, 939–940, 939f–940f
pediatric, 1449–1458.e1
alternative management plan for, 1455
anesthesia for, 1451
common errors in technique for, 1454
complications of, 1454–1455
contraindications to, 1451
FDA-approved, 1449
history of, 1450
imaging for, 1450
indications for, 1451
instruments and equipment for, 1451
key anatomic landmarks for, 1451
monitoring for, 1451
operative period in, 1451–1454
perioperative antibiotic prophylaxis for, 1451
physical examination for, 1450
positioning for, 1451
postoperative period in, 1454–1455

preoperative period in, 1449–1451
preoperative preparation for, 1451
prerequisite skills for, 1452
surgical technique of, 1452–1454, 1452f–1455f
Cochleostomy, in pediatric cochlear implantation, 1451, 1453–1454, 1456f
"Cold steel"
for recurrent respiratory papillomatosis, 17
in tonsillectomy and tonsillotomy, 1351t
Colonic interposition, for cervical esophagus cancer, 354–355
Combined middle fossa and transmastoid approach, of facial nerve, tumors of, 956–957, 956f
Combined transcervical submandibular and transparotid approaches, to prestyloid tumors, 489
Commissure, anterior, recurrent respiratory papillomatosis removal from, 17, 17f, 1382
Complete maxillectomy, 711–717.e1
anesthesia for, 713
common errors in technique for, 714–715
complications of, 715
contraindications to, 712
facial incisions for, 715f
history of, 711
imaging for, 711–712, 712f
indications for, 712
key anatomic landmarks for, 714
operative risks of, 714
physical examination for, 711
positioning and intraoperative setup for, 713–714
postoperative management of, 715

preoperative preparation for, 712–713
surgical technique, 714
Completion lymph node dissection (CLND), for melanoma, 1116
Composite chondrocutaneous grafts, for nasal reconstruction, 1143, 1145f
Composite facelift, 1090
Composite resection, segmental mandibulectomy in, 1273
Computed tomography (CT)
for acoustic neuroma, 960
for anterior ethmoid artery, 662, 662f
in bone-anchored hearing devices, 919
bone-windowed, of petrous apex lesion, 984f
for branchial cleft cyst, 1418
in bronchoscopy, 131
for buccal carcinoma, 220
in central compartment neck dissection, 459
for cerebrospinal fluid leak, 768
for cervical esophagus cancer, 351, 351f–352f
in cervicofacial transposition flaps, 1192
for choanal atresia/pyriform aperture stenosis, 1326, 1326f
for congenital midline nasal masses, 1333, 1334f
with contrast, in carotid body tumors, 492
in cranioplasty, 1232–1233
in dacryocystorhinostomy, 1028
for deep neck abscesses, 513
in Draf III procedure, 745
in endoscopic nasopharyngectomy, 288
in endoscopic petrosal approaches, to cranial base, 802–803
in endoscopic sphenoidotomy, 730

in external auditory canal exostoses and osteomas, 853, 854f
in external ethmoidectomy, 725
in facial translocation approach, 310
in frontal sinus cranialization, 761
in frontal sinus obliteration, 753, 753f
for glomus tumors, 975
for hereditary hemorrhagic telangiectasia, 669
in horizontal partial laryngectomy, 93–94, 93f–94f
for juvenile angiofibroma, 820, 820f
for laryngeal trauma, 46, 46f–47f
for laryngocele, 40, 40f
in lateral canthotomy, 1051
for lip cancer, 188
in mandibular distraction, 1424, 1424f
for mandibular fractures, 1295
in mandibular osteotomy, 1281
in marginal mandibulectomy, 1267–1268
in mastoid surgery, 913
of maxillary sinus, 694, 712, 712f
in maxillary swing/transpalatal/midface degloving with Le Fort I osteotomy approach, 302
in medial maxillectomy, 706
in microlaryngoscopy, 21
in microtia reconstruction, 1469
for middle ear malformations, 1440, 1441f
in modified radical neck dissection, 444, 444f
in myringoplasty and tympanoplasty, 881
for nasal fracture, 1288

in neck surgery, 499
for neural tumors, of parapharyngeal space, 487
in office-based procedures, of salivary glands, 584
in optic nerve decompression, 1033
in orbital decompression, 1039
for oroantral fistulas, 700–701, 700f
for oropharyngeal malignancy, 238
in ossicular chain reconstruction, 892
in otosclerosis, 902
in partial pharyngectomy, 336
in pediatric cochlear implantation, 1450
for penetrating trauma, 330, 330f
in pericranial scalp flap, 1165
in pharyngectomy, 280
in posterolateral neck dissection, 480
for prestyloid parapharyngeal space tumor, 470, 470t
in radical neck dissection, 451
of ranula, 596f–597f, 597
in rhinectomy, 675
in rib graft, 1227
in salivary endoscopy, 592
in scalp reconstruction, 1149
in septoplasty, 632
for sinonasal disorders, 626
for skin cancer of head and neck, 1114
in skull base reconstruction, 832, 832f
in soft palate surgery, 262
in split calvarial graft, 1221

in stereotactic radiosurgery, 1023
for subglottic stenosis, 1363
in submandibular gland excision, 608
in superficial parotidectomy, 613
in superior semicircular canal dehiscence, 1017f
in supracricoid partial laryngectomy, 108
in supraglottic transoral robotic surgery, 114
in surgery of the anterior cranial base, 782
in temporal bone resection, 967
in temporal bone trauma, 1001
of temporal bones, 995, 995f
in temporoparietal fascial flap, 1171
for thyroglossal duct cyst, 1410
in thyroid surgery, 555
in total laryngectomy, 118
in total laryngopharyngectomy, 124
in tracheal resection, 157
for tracheal stenosis, 1402, 1403f
in transcervical pharyngotomy, 271
in transnasal/transoral surgery, 826
in transoral and robotic tonsil surgery, 250
in transoral CO_2 laser microsurgery, 84
in transoral laser microsurgery, 244
in transoral removal of elongated styloid process, 266
three-dimensional (3D) reconstruction of, 266, 267f
in transoral robotic surgery, 256–257
for traumatic soft tissue and vascular injuries, to neck, 505
in turbinate surgery, 648

in vertical partial laryngectomy, 100
Computed tomography angiography (CTA)
in cranioplasty, 1233
in office-based procedures, of salivary glands, 584
in tonsillectomy, 1348
for traumatic soft tissue and vascular injuries, to neck, 505
Computed tomography cisternography, for cerebrospinal fluid leak, 768, 768f
Computer-assisted navigational technology, 721
Computer-assisted virtual surgical planning, genioglossus advancement and, 401
Concha bullosa, resection of, 651
Conchomastoid sutures, in otoplasty, 1484
Conductive hearing loss
bone-anchored hearing devices in, 920
in mastoid surgery, 917
ossicular chain reconstruction and, 890
in temporal bone trauma, 1004
Condylar/subcondylar fractures, 1296
Congenital aural atresia (CAA)
hearing rehabilitation in, alternatives for, 1478, 1481
surgical repair of, 1476
common errors in technique for, 1480
contraindications to, 1478
fused malleus-incus complex (MIC) in, 1477, 1477f
grading system for, 1477, 1477t
history of, 1476
imaging for, 1476–1477

key anatomic landmarks for, 1479
physical examination for, 1476, 1477f
postoperative management of, 1481
technique for, 1479–1480, 1479f–1480f
timing and sequence of, 1478
unilateral *versus* bilateral, 1478
Congenital epidermoid tumors, of temporal bone, surgical management of, 982–993.e1
alternative management plan for, 993
anesthesia for, 986
audiometry for, 986
complications of, 992
contraindications to, 986
history of, 985–986
imaging for, 986
indications for, 986
instruments and equipment for, 986
monitoring for, 986
operative period in, 986–991
operative risks of, 987
perioperative antibiotic prophylaxis for, 986
physical examination for, 986
positioning for, 986
postoperative period in, 991–993, 992f
preoperative period in, 985–986
preoperative preparation for, 986
prerequisite skills for, 986
surgical technique of, 987–991

Congenital external auditory canal stenosis (CEACS)
hearing rehabilitation in, alternatives for, 1478, 1481
surgical repair of, 1476
common errors in technique for, 1480
contraindications to, 1478
grading system for, 1477, 1477t
history of, 1476
imaging for, 1476–1477
indications for, 1478
physical examination for, 1476, 1477f
postoperative management of, 1481
technique for, 1480
timing and sequence of, 1478
type A anomaly of, 1478
type B anomaly of, 1478
Congenital footplate fixation, 1442, 1446
Congenital high airway obstruction syndrome (CHAOS), 1388
Congenital midline nasal masses, surgery for, 1332–1340.e1
alternative management plan for, 1338
anesthesia for, 1334
common errors in technique for, 1337–1338
complications of, 1338
contraindications to, 1333
history of, 1332
imaging for, 1333, 1334f
indications for, 1333
instruments and equipment for, 1334
key anatomic landmarks for, 1334–1335, 1335f–1336f

monitoring for, 1334
operative period in, 1334–1338
operative risks of, 1335
perioperative antibiotic prophylaxis for, 1334
physical examination for, 1332–1333, 1333f
positioning for, 1334
postoperative management of, 1338
postoperative period in, 1338
preoperative period in, 1332–1334
preoperative preparation for, 1333–1334
prerequisite skills for, 1335
surgical technique of, 1335–1337, 1337f
Congenital nasal pyriform aperture stenosis, 1325
Congenital tracheal stenosis (CTS), 1401, 1402f
Conjunctival incision, for lower eyelid transconjunctival (preseptal) blepharoplasty, 1072
Conservation partial laryngectomy, 92
Continuous positive airway pressure (CPAP), for obstructive sleep apnea, 371
Contour defect, after frontal sinus cranialization, 764
Contrast angiography, in endonasal approach, to sella and parasellar areas, 775
Contrast-enhanced esophagram, in esophagoscopy and hypopharyngoscopy, 318, 318f
Corneal injury
blepharoplasty and, 1076
medial maxillectomy, complications from, 707
Corneal protection, for anterior and posterior ethmoid artery ligation, 665
Coronal approaches

for cranio-orbital and midfacial skeleton fractures, 1300
in pericranial scalp flap, 1166
Coronal brow lift procedure, for scalp reconstruction, 1152, 1153f
Corrugators, Botox cosmetic injections of, 1104
Corticosteroids
for acquired laryngeal stenosis, 67
intratympanic, 843
Cosmetic Botox and fillers, 1102–1111.e1, 1103t, 1106f, 1108t
Botox cosmetic, 1103–1105
botulinum toxin products and, distant spread of, 1107
history of, 1102
hyaluronic acid and, 1107–1110
patient assessment in, 1102–1103
patient selection for, 1102
physical examination for, 1102
preprocedure period of, 1102–1103
procedure/treatment in, 1103–1105
Cosmetic deformities, after facial translocation approach, 315
Costochondral cartilage graft technique, 1468
Cranial base
anterior, surgery of, 782–790.e1
anatomical landmarks for, 784
anesthesia for, 784
antibiotic prophylaxis for, 784
bicoronal approach for, 784–787, 785f–786f
common errors in technique for, 787
complications of, 789
contraindications to, 783

endoscopic approach for, 787, 788f
history of, 782
imaging for, 782
indications for, 783, 783f
instruments and equipment for, 784
management plan for, 789
monitoring for, 784
operative period in, 784–787
operative risks of, 784
physical examination for, 782
positioning for, 784
postoperative management of, 787–788
postoperative period in, 787–789
preoperative period in, 782–784
preoperative preparation for, 783–784
prerequisite skills for, 784
technique for, 784–787
endoscopic petrosal approaches to, 802–808.e1, 803f, 803t
anatomic landmarks for, 805
anesthesia for, 804
antibiotic prophylaxis for, 804
bilateral paraseptal transphenoidal approach in, 806
common errors in technique for, 807
complications of, 807
contraindications to, 804
history of, 802
imaging for, 802–803
indications for, 803, 804f

instruments and equipment for, 805
lateralization of the carotid artery in, 806, 806f–807f
monitoring for, 805
operative period in, 804–806
operative risks of, 805
physical examination for, 802
positioning for, 804
postoperative management of, 807
postoperative period in, 807
preoperative period in, 802–804
preoperative preparation for, 804
prerequisite skills for, 805
surgical technique of, 805–806
transethmoidal-pterygo-sphenoidal approach in, 806
Cranial nerve deficits, in petrous apex, lesion of, 992
Cranial nerve injury
after endonasal approach, to sella and parasellar areas, 780
in laryngeal trauma, 46
lower, in petrous apex, lesion of, 992
Cranial nerve (CN) IV and VI injury, after petrous apex lesion surgical treatment, 992
Cranial nerve (CN) XI, radical neck dissection and, 452
Cranialization, 760
Cranio-orbital skeleton, fractures of, 1299–1308.e1, 1303f–1304f
alternative management plan for, 1308
common errors in technique for, 1307
complications of, 1308
contraindications to, 1300

history of, 1299
imaging for, 1299
indications for, 1299–1300
instruments and equipment for, 1300
key anatomic landmarks for, 1300, 1301f
monitoring for, 1300
operative period in, 1300–1307
operative risks of, 1301
perioperative antibiotic prophylaxis for, 1300
physical examination for, 1299
positioning for, 1300
postoperative management of, 1307–1308
postoperative period in, 1307–1308
preoperative period in, 1299–1300
preoperative preparation for, 1300
prerequisite skills for, 1301
surgical technique of, 1301–1307
Craniofacial examination, for cleft palate and velopharyngeal dysfunction, 1460
Craniofacial reconstruction, for congenital midline nasal masses, 1335
Cranioplasty, 1232–1239.e1
alternative management plan for, 1239
anesthesia for, 1236
common errors in technique for, 1238
complications of, 1239
contraindications to, 1234–1236
history of, 1232
imaging for, 1232–1233

indications for, 1233–1234, 1233f–1235f
instruments and equipment for, 1237
key anatomic landmarks for, 1237
monitoring for, 1237
operative period in, 1236–1238
operative risks of, 1237
perioperative prophylaxis for, 1237
positioning for, 1236–1237, 1236f
postoperative management in, 1238–1239
postoperative period in, 1238–1239
preoperative period in, 1232–1236
preoperative preparation and materials in, 1236
prerequisite skills for, 1237
technique of, 1237–1238
closure, 1238, 1238f
intraoperative, 1236f–1238f, 1237
Cribriform plate
in cerebrospinal fluid leak, 770
in Draf III procedure, 746
Cricoarytenoid joints, 60
bilateral vocal fold immobility and
mechanical fixation of, 52
palpation of, 55
Cricoid split, anterior, for subglottic stenosis, 1364
Cricopharyngeal myotomy, for UES dysfunction, 323, 325–326, 325f
Cricopharyngeal spasm, 180
Cricopharyngeus muscle, 323, 324f, 325
Cricotracheal resection, for subglottic stenosis, 1368–1369, 1369f–1370f

Crista ethmoidalis, 656
Crista galli, congenital midline nasal masses in, 1335
Cross-facial nerve grafting, 1244
anesthesia for, 1244, 1244f
complications after, 1246
positioning for, 1244
technique for, 1244–1245, 1245f
Cross-sectional imaging, in deep lobe tumor, 619
Crow's feet lines, Botox cosmetic injections of, 1104, 1105f
Cryosurgical treatment, for skin cancer of head and neck, 1123
CT, *See* Computed tomography.
Cuff electrode placement, in hypoglossal nerve stimulation, 391–392, 392f
Curaçao criteria, 669t
Curettage, with electrodesiccation, for skin cancer of head and neck, 1123
Curved Abraham cannula, in laryngeal office-based procedures, 2
Cutaneous malignancies, 424
Cutaneous squamous cell carcinoma (cSCC), determining surgical margins in, 1115, 1115f
Cutting and diamond burrs, in keratitis obturans and canal cholesteatoma, 863, 863f
Cyst
branchial cleft, *See* Branchial cleft cyst.
nasolacrimal duct, 1332–1340.e1
alternative management plan for, 1338
anesthesia for, 1334
common errors in technique for, 1337–1338
complications of, 1338
contraindications to, 1333

history of, 1332
imaging for, 1333, 1334f
indications for, 1333
instruments and equipment for, 1334
key anatomic landmarks for, 1334–1335, 1335f–1336f
monitoring for, 1334
operative period in, 1334–1338
operative risks of, 1335
perioperative antibiotic prophylaxis for, 1334
physical examination for, 1332–1333, 1333f
positioning for, 1334
postoperative management of, 1338
postoperative period in, 1338
preoperative period in, 1332–1334
preoperative preparation for, 1333–1334
prerequisite skills for, 1335
surgical technique of, 1335–1337, 1337f
saccular, laryngeal, 39

Lemierre syndrome and, 516–517, 517f
longus colli tendinitis and, 517, 518f

monitoring for, 514
necrotizing fasciitis and, 517
operative period in, 513–516
operative risks of, 516
pathogenesis of, 515
pathogens in, 515–516
perioperative antibiotic prophylaxis for, 514
physical examination for, 513
positioning for, 514
postoperative management of, 516
postoperative period in, 516–518
preoperative period in, 513
preoperative preparation for, 513
prerequisite skills for, 516
surgical technique of, 516, 516f
vascular rupture and, 517
Deep neck infections, 513
Deep plane facelift, 1090, 1092f
Deep vein thrombosis (DVT)
after surgery of the anterior cranial base, 789
modified radical neck dissection and, 448
Definitive radiation, for carotid body tumors, 496
Degloving, mid facial, for medial maxillectomy, 708
Deglutition, delayed, as complication of supraglottic laryngectomy, 98
Dehiscence
complications of oroantral fistulas, 703
palatal, 1467
of surgical wound, after orbital exenteration, 1058–1059

Dehydration, in uvulopalatopharyngoplasty, 375

Delayed complications, in hearing devices, bone-anchored, 925

Delirium tremens, monitoring for, in modified radical neck dissection, 448

Deltopectoral flap (DP), 1180–1185.e1

alternative management plan for, 1183

anesthesia for, 1181

for cervical esophagus cancer, 355–356

common errors in technique for, 1183

complications of, 1183

contraindications to, 1181

history of, 1180

imaging for, 1180

indications for, 1180–1181

instruments and equipment for, 1182

key anatomic landmarks for, 1182

monitoring for, 1182

operative period in, 1181–1183

operative risks of, 1182

perioperative antibiotic prophylaxis for, 1182

physical examination for, 1180

positioning for, 1181

postoperative management of, 1183

postoperative period in, 1183

preoperative period in, 1180–1181

preoperative preparation for, 1181

prerequisite skills for, 1182

surgical technique of, 1182–1183, 1182f

Dental injury
after phonomicrosurgery, 9
after supraglottic transoral robotic surgery, 116
after transoral robotic surgery, 260
Dental prosthetic, for oral-nasal separation loss, 231, 232f–233f
Dental trauma, after esophagoscopy and hypopharyngoscopy, 321
Dentition, *See* Tooth (teeth).
Dentoalveolar fractures, 1296
Depressed scar, management of, 165–169.e1, 165f
Depressor anguli oris, Botox cosmetic treatment of, 1104
Depressor septi muscle, Botox cosmetic treatment of, 1105
Dermabrasion, 1101
Dermal fillers, 1101, 1104
Dermatochalasis, 1070
Dermatofibrosarcoma protuberans (DFSP), 1117
Desaturation, after percutaneous tracheostomy, 150
Dexamethasone
intratympanic, 844–845
for vocal fold injection, 22
Diabetes insipidus, after endonasal approach, to sella and parasellar areas, 780
Diet, in uvulopalatopharyngoplasty, 375
Diffuse idiopathic skeletal hyperostosis, 520, 520f
Diffuse polyposis, 7
Diffusion-weighted imaging (DWI), for petrous apex cholesterol granuloma, 983–984, 985f
Digastric muscle
posterior belly of

radical neck dissection and, 452
superselective neck dissection and, 432
transposition, 1264
Dilatation
for acquired laryngeal stenosis, 67
serial, 174
Dilation with balloons, for UES dysfunction, 327
Dimpled chin, Botox cosmetic treatment of, 1105
Dingman retractor, for transoral surgery, 828–829, 829f
Diode laser, in tonsillectomy and tonsillotomy, 1351t
Diplopia, in orbital decompression, 1042
Direct closure, for scalp reconstruction, 1152
Direct endoscopic excision, of submandibular gland, 500
Direct incision endoscopic branchial cleft cyst excision, in neck surgery, 502–503
Direct laryngoscopy/bronchoscopy
diagnostic, in laryngeal cleft repair and laryngotracheal separation, 1373
during EXIT procedure, 1390f
for recurrent respiratory papillomatosis, 1383
Disequilibrium, in vertigo, after surgery, 1013
Dislocation, of cranioplasty, 1239
Displaced tracheostomy tube, after open tracheostomy, 143, 143f
Distant metastasis, 674
Diverticulopexy, 326
Dizziness, in temporal bone trauma, 1004
Donor site morbidity, in temporoparietal fascial flap, 1173
Dorsal nasal artery, in paramedian forehead flaps, 1161

Double-opposing Z-plasty, 1464–1465, 1464f

Double-stage laryngotracheal reconstruction, for subglottic stenosis, 1368, 1368f

Draf I, of ethmoidectomy, 743

Draf III, endoscopic modified Lothrop, 744–751.e1

alternative management plan for, 750

prerequisite skills for, 794
surgical technique of, 794–799
antral corridor in, 795
general principles for, 794, 794f
nasal corridor in, 794–795
nasal preparation for, 794
pterygoid process, resection of, 795–799, 798f–800f
pterygopalatine fossa in, 795, 796f–797f
Endoscopic ethmoidectomy, 718–724.e1
Endoscopic laser excision, for laryngocele excision, 41, 42f
Endoscopic microsurgery, for acquired laryngeal stenosis, 67
Endoscopic middle meatal antrostomy, 686–693.e1
anesthesia for, 687
antibiotic prophylaxis for, 688
common errors in technique for, 691
complications of, 690f, 691–692, 692f
contraindications to, 687
history of, 686
imaging for, 687
indications for, 687
instruments and equipment, 688
key anatomic landmarks for, 688, 689f
monitoring for, 688
operative risks of, 688–689
physical examination for, 686–687, 687f
positioning for, 688

postoperative management of, 691
preoperative preparation for, 687, 688f
prerequisite skills for, 688
surgical technique of, 689–690, 689f–690f
Endoscopic nasopharyngectomy, 287–292.e1
alternative management plan for, 291
anesthesia for, 288
common errors in technique for, 290
complications of, 291
contraindications to, 288
history of, 287–288
imaging for, 288
indications for, 288
instruments and equipment for, 289
key anatomic landmarks for, 289
management after, 290–291, 291f
monitoring for, 288–289
nasopharyngeal carcinoma patient treated with, prognostic factors and survival for, 291
operative period in, 288–290
perioperative antibiotic prophylaxis for, 288
physical examination for, 288
positioning for, 288
postoperative period in, 290–291
preoperative period in, 287–288
preoperative preparation for, 288
prerequisite skills for, 289
risks of, 289

technique for, 289–290, 289f–290f
Endoscopic percutaneous dilatational tracheostomy (PDT), 146
Endoscopic petrosal approaches, to cranial base, 802–808.e1, 803f, 803t
anatomic landmarks for, 805
anesthesia for, 804
antibiotic prophylaxis for, 804
bilateral paraseptal transphenoidal approach in, 806
common errors in technique for, 807
complications of, 807
contraindications to, 804
history of, 802
imaging for, 802–803
indications for, 803, 804f
instruments and equipment for, 805
lateralization of the carotid artery in, 806, 806f–807f
monitoring for, 805
operative period in, 804–806
operative risks of, 805
physical examination for, 802
positioning for, 804
postoperative management of, 807
postoperative period in, 807
preoperative period in, 802–804
preoperative preparation for, 804
prerequisite skills for, 805
surgical technique of, 805–806
transethmoidal-pterygo-sphenoidal approach in, 806
Endoscopic resection, in robotic-assisted nasopharyngectomy, 298

Endoscopic septoplasty, 631
surgical technique of, 636–638, 636f–637f
Endoscopic sinus surgery (ESS), 718, 733
for congenital midline nasal masses, 1335
frontal sinus, 738–743.e1
Endoscopic suture lateralization, in surgical treatment of BVFI, 57, 57f
Endoscopic transsphenoidal approach, for petrous apexcholesterol granulomas, 988–989
Endoscopy
acquired laryngeal stenosis from, 62
for choanal atresia repair, 1327–1328, 1328f–1329f
for laryngeal trauma, 48
nasal, in endoscopic ethmoidectomy, 718
for otitis media
flexible, 868
rigid, 868
for penetrating trauma, 331
salivary, 592–595.e1
alternative management plan for, 595
anesthesia for, 592–593
common errors in technique for, 595
complications of, 595
contraindications to, 592
history of, 592
hybrid approaches of, 594–595
imaging for, 592
indications for, 592
instruments and equipment for, 593

key anatomic landmarks for, 593
monitoring for, 593
operative period in, 592–594
operative risks of, 593
perioperative antibiotic prophylaxis for, 593
positioning for, 593
postoperative management of, 595
postoperative period in, 595
preoperative period in, 592
preoperative preparation for, 592
prerequisite skills for, 593
surgical technique of, 593–594, 594f
Endotracheal tube, 85, 85f
obstruction of, after adenoidectomy, 1345
for phonomicrosurgery, 8
Enophthalmos, 1308
Enteral feeding access, for UES dysfunction, 327
Envoy Medical Corporation, 927, 928f
Eosinophilic mucin rhinosinusitis, 628
Epidural abscess, otitis media and, 874, 876, 876f
Epidural hematoma
in facial nerve decompression, 950
in superior semicircular canal dehiscence, 1020
Epiglottis, 60
Epiglottopexy, 102–104, 105f
Epinephrine, in microflap technique, 11
Epineurium, 943, 945f
Epiphora

after blepharoplasty, 1076
after medial maxillectomy, 708
after nasal septum perforation, 645
Epistaxis, 668
after endonasal approach, to sella and parasellar areas, 780
anterior, 628
ethmoid artery ligation for, anterior and posterior, 661–667.e1
etiologies of, 662t
in orbital decompression, 1042
risk of, in endoscopic middle meatal antrostomy, 688–689
sphenopalatine artery ligation for, 654–660.e1
Epistaxis Severity Score, 668
Epithelial cysts, myringoplasty and tympanoplasty and, 888
Epstein-Barr virus (EBV), nasopharyngeal carcinoma and, 287
Erb's point, 1086, 1089f
Ergonomics, surgeon, in phonomicrosurgery, 11
Erosive pustular dermatosis, skin cancer of head and neck and, 1123
Esophageal cancer, cervical, *See* Cervical esophageal cancer.
Esophageal disorders, 317
Esophageal perforation, anterior transcervical approach and, 521
Esophageal speech, 175
Esophagogastroduodenoscopy, for tracheal stenosis, 1402–1403
Esophagography
for cervical esophagus cancer, 351, 351f
for penetrating trauma, 330
Esophagoscopy, 317–322.e1
alternative management plan for, 321
complications of, 321, 321f

contraindications to, 319
flexible
indications for, 319
transnasal, 319–320
history of, 317
imaging for, 318–319, 318f
operative period in, 319–320
physical examination for, 318, 318f
postoperative management of, 321
postoperative period in, 321–322
preoperative period in, 317–319
preoperative preparation for, 319
rigid, 320, 320f–321f
indications for, 319
Esophagostomy, 333f
Esophagus
anatomy of, 317
perforation of, 321, 321f
ESP, *See* Expansion sphincter pharyngoplasty.
ESS, *See* Endoscopic sinus surgery.
Esteem Implant, 927, 928f
alternative management plan for, 931
anesthesia for, 928
audiogram in, 927–928
battery change technique for, 931
common errors in technique for, 930–931
complications of, 931
contraindications to, 928

history of, 927
indications for, 928
instruments and equipment for, 928–929
key anatomic landmarks for, 929
monitoring for, 928
operative period in, 928–930
operative risks of, 929
perioperative antibiotic prophylaxis for, 928
physical examination for, 927
positioning for, 928
postoperative management of, 931
postoperative period in, 931
preoperative period in, 927–928
preoperative preparation for, 928
prerequisite skills for, 929
surgical technique of, 929–930, 929f–930f
Esthesioneuroblastoma, 784
Estlander flap, for large lip tumor excision, 192, 192f
Ethmoid artery ligation, anterior and posterior, for epistaxis, 661–667.e1
alternative management plan for, 666
anesthesia for, 663
common errors in technique for, 666
complications of, 666
contraindications to, 663
endoscopic surgical technique of, 664–665
external surgical technique of, 665–666, 665f
history of, 661–662
imaging for, 662

indications for, 662–663
instruments and equipment for, 663
key anatomic landmarks for, 663–664, 663f–664f
monitoring for, 663
operative period in, 663–666
operative risks of, 664
physical examination for, 662
positioning for, 663
postoperative management of, 666
postoperative period in, 666
preoperative preparation for, 663
prerequisite skills for, 664
Ethmoid mucoceles, 719
Ethmoid sinus, 725
Ethmoid sinus roof, in cerebrospinal fluid leak, 770
Ethmoidal arteries, 654
Ethmoidectomy
anterior, of ethmoid artery ligation, 664
endoscopic, 718–724.e1
alternative management plan for, 724
anesthesia for, 720
common errors in technique for, 722
complications of, 724
contraindications to, 720
imaging for, 718–719, 719f–720f
indications for, 719–720
instruments and equipment for, 721
key anatomic landmarks for, 721, 721f

monitoring for, 721
operative period in, 720–722
operative risks of, 722
perioperative medications of, 720–721
physical examination for, 718
positioning for, 720, 721f
postoperative management of, 722–724
postoperative period in, 722–724
preoperative period in, 718–720
preoperative preparation for, 720
prerequisite skills for, 721–722
surgical technique of, 722, 723f
external, 725–728.e1
alternative management plan for, 727
anesthesia for, 725
common errors in technique for, 727
complications of, 727
contraindications to, 725
history of, 725
imaging for, 725, 726f
indications for, 725
instruments and equipment for, 725–726
key anatomic landmarks for, 726
monitoring for, 725
operative period in, 725–727
operative risks of, 726, 726f
perioperative antibiotic prophylaxis for, 725
physical examination for, 725

positioning for, 725
postoperative management of, 727
postoperative period in, 727
preoperative period in, 725
preoperative preparation for, 725
prerequisite skills for, 726
surgical technique of, 726–727, 726f
European Laryngological Society, 86t, 87, 87f
Eustachian tube
dysfunction of, 867, 1460
injury to, after adenoidectomy, 1345
Eutectic mixture of local anesthesia (EMLA) cream, in middle ear, 839
Evoked electromyography, for facial nerve decompression, 945, 946f
Ex utero intrapartum treatment (EXIT) procedure, 1387–1392.e1
alternative management plan for, 1391
anesthesia for, 1388–1389
common errors in technique for, 1391
complications of, 1391
contraindications to, 1388
history of, 1387
imaging for, 1387
indications for, 1388, 1388f
instruments and equipment for, 1389
key anatomic landmarks for, 1389
monitoring for, 1389
operative period in, 1388–1391, 1389f
operative risks of, 1390
perioperative antibiotic prophylaxis for, 1389

physical examination for, 1387
positioning for, 1389
postoperative management of, 1391
postoperative period in, 1391
preoperative period in, 1387–1388
preoperative preparation for, 1388
prerequisite skills for, 1389
surgical technique of, 1390, 1390f
Excess skin excision, in blepharoplasty, 1070
EXIT procedure, *See* Ex utero intrapartum treatment (EXIT) procedure.
Exostoses, of external auditory canal, 852–859.e1, 853f
surgical management of
alternative management plans for, 858

anesthesia for, 1256
common errors in technique for, 1257–1259
complications of, 1257–1259
contraindications to, 1256
indications for, 1256
instruments and equipment for, 1256, 1258
key anatomic landmarks for, 1256–1258
monitoring for, 1256
operative period in, 1256, 1258
operative risks of, 1257–1258
perioperative antibiotic prophylaxis for, 1256
positioning for, 1256
postoperative management of, 1257
postoperative period in, 1257–1259
preoperative preparation for, 1256
prerequisite skills for, 1257–1258
surgical technique of, 1257–1258, 1259f, 1264
Facial recess
drilling of, in mastoid surgery, 915–916, 916f
in pediatric cochlear implantation, 1451–1452, 1453f
Facial resurfacing, with peels and lasers, 1095–1101.e1
Facial sculpting, with Botox cosmetic, 1105
Facial structures, in analysis of defect, 1134, 1136f–1137f
Facial symmetry, microtia reconstruction and, 1469
Facial translocation approach (FTA), 304–305, 304f–306f, 307

to nasopharynx, 308–316.e1
alternative management plan for, 315
anesthesia for, 312–313
common errors in technique for, 314
complications of, 315
contraindications to, 312
history of, 309–310
imaging for, 310
indications for, 310–312
instruments and equipment for, 313
key anatomic landmarks for, 313
monitoring for, 313
operative period in, 312–314
operative risks of, 313
perioperative antibiotic prophylaxis for, 313
physical examination for, 310
positioning for, 313
postoperative management of, 314–315
postoperative period in, 314–315
preoperative period in, 309–312
preoperative preparation for, 312
prerequisite skills for, 313
surgical technique of, 308f–312f, 313–314
False passage, after percutaneous tracheostomy, 151
False vocal folds, 60
Fascia lata graft, 1214–1218
alternative management plan for, 1218
anesthesia for, 1215

common errors in technique for, 1216
complications of, 1218
contraindications to, 1215
imaging for, 1214
indications for, 1214–1215
instruments and equipment for, 1215
key anatomic landmarks for, 1215, 1215f
monitoring for, 1215
operative period in, 1215–1216
operative risk of, 1215
perioperative antibiotics of, 1215
physical examination for, 1214
positioning for, 1215
postoperative management of, 1218
postoperative period in, 1218
preoperative preparation for, 1215
prerequisite skills for, 1215
surgical technique of, 1215–1216, 1215f–1217f
Fascial grafts, autologous, 1214–1220.e1
preoperative period in, 1214
Fascial sling, 1214
Fetal airway obstruction, 1387
Fibroadipose tissue, superselective neck dissection and, 432
Fibrous mass, of vocal fold, 7
Fibular free flap, for microvascular reconstruction, 1131
Fifth-degree injury, of facial nerve, 943, 945f
Fine needle aspiration (FNA)
in central compartment neck dissection, 459

for office-based procedures, of salivary glands, 584
in open thyroidectomy, 528
for submandibular gland excision, 608
Fine-needle aspiration biopsy (FNAB)
of head and neck mass, 413–417.e1
alternative management plan for, 417
anesthesia for, 415
antibiotic prophylaxis for, 415
common errors in technique for, 416
contraindications to, 415
history of, 414
imaging for, 414
indications for, 414
instruments and equipment for, 415, 415f
monitoring for, 415
operative period in, 415–416
operative risks of, 415
physical examination for, 414
positioning for, 415, 415f
postoperative management of, 417
postoperative period in, 417
preoperative period in, 414–415
preoperative preparation for, 415
prerequisite skills for, 415
surgical technique of, 415–416, 416f, 416b
ultrasound-guided, 414
before minimally invasive video-assisted thyroidectomy, 537
in posterolateral neck dissection, 480–481

in robotic-assisted thyroidectomy, 542
in superficial parotid mass, 618
Fire, during open tracheostomy, 141
First bite syndrome
after prestyloid parapharyngeal space tumor excision, 473
in parapharyngeal space, 485, 490
First-degree injury, of facial nerve, 943, 945f
Fisch classification of glomus tumors, 974, 975b
Fistula
after laryngotracheal separation, 155
formation, after robotic-assisted nasopharyngectomy, 299
in hypopharyngeal defect reconstruction, 348
oral-nasal, after inferior maxillectomy, 234
in orbital exenteration, 1059
oroantral, 700–704.e1, 700f, 702f–704f
pharyngocutaneous, after arytenoid adduction, 31
tracheocutaneous, after tracheostomy, 165–169.e1
Fistula tract, branchial anomalies of, 1415
Fitzpatrick skin types, 1095t
Flap defect, rotation and advancement of, of cervicofacial flaps, 1194
Flap design
of cervicofacial flaps, 1192–1194, 1193f
in paramedian forehead flaps, 1161–1162
Flap elevation, of cervicofacial flaps, 1194
Flap failure, after nasal septum perforation, 645
Flap inset, in pericranial scalp flap, 1167
Flap length, in pericranial scalp flap, 1167
Flap necrosis, after superficial parotidectomy, 616

Flap reconstruction
in rhinectomy, 677
in scalp reconstruction, 1149–1158.e1
common errors in technique for, 1155
complications of, 1156–1157
contraindications to, 1150
editorial comment in, 1157
history of, 1149
imaging for, 1149
indications for, 1149–1150
instruments and equipment for, 1151
key anatomic landmarks for, 1151
operative period in, 1151–1155
operative risks of, 1151
physical examination for, 1149, 1150f
postoperative management of, 1155–1156
postoperative period in, 1155–1157
preoperative assessment of, 1149
preoperative period in, 1149–1151
preoperative preparations for, 1151
prerequisite skills for, 1151
revisional reconstructive procedures for, 1157
surgical techniques for, 1151–1155, 1152f–1156f
Flaps
Abbe, for large lip tumor excision, 190–192, 191f
cervicofacial, 1192
deltopectoral, 1180–1185.e1
Estlander, for large lip tumor excision, 192, 192f

Karapandzic, for large tumor of lip, 192, 193f
for oral-nasal separation loss, 231, 234f
submental island, 1195
supraclavicular, 1194
Flexible bronchoscopy, 131, 132f
Flexible fiberoptic bronchoscopy, 1393
indications for, 1394
surgical technique of, 1396–1397
Flexible fiberoptic laryngoscopy
for penetrating trauma, 329
for pharyngectomy, 279
Flexible fiberoptic nasal endoscopy, for choanal atresia/pyriform aperture stenosis, 1326
Flexible laryngoscopy
for laryngeal trauma, 46
in surgical treatment of BVFI, 52
Flexible nasolaryngoscopy, in mandibular distraction, 1423–1424
Flexible nasopharyngeal laryngoscopy, for acquired laryngeal stenosis, 64
Flexible nasopharyngoscopy, in uvulopalatopharyngoplasty, 372
Flexible transnasal esophagoscopy, 319–320
Flexion/extension cervical spine films, in tonsillectomy, 1348
Floating stapedial footplate, from otosclerosis, 909, 909f
Floor-of-mouth resection, 210–218.e1, 211f
alternative treatment regimens for, 218
anesthesia for, 213
common errors in technique for, 216
complications of, 217

contraindications to, 212
free flap of, 217
history of, 210–211
imaging for, 211–212
indications for, 212
instruments and equipment for, 213
key anatomic landmarks for, 213
lip split of, 216
mandibulotomy of, 216
monitoring for, 213
operative period in, 213–216
perioperative antibiotic prophylaxis for, 213
physical examination for, 211, 212f
positioning for, 213
postoperative management of, 216–217
postoperative period in, 216–218
preoperative period in, 210–213
preoperative preparation for, 212–213
prerequisite skills for, 213
reconstruction of, 216
segmental mandibulectomy of, 216, 217f
surgical technique of, 213–216, 214f–216f
Fluid collection, after thyroid surgery, 560
Folded forehead flap, 1138, 1141f
Fonticulus frontalis, congenital midline nasal masses in, 1334–1335, 1336f
Footplate, problems with, ossicular chain reconstruction for, 896, 900f
Footplate defects, 1442, 1444f
Footplate fixation, congenital, 1442, 1446

Foramen cecum, congenital midline nasal masses in, 1334, 1335f
Foramen ovale, juvenile angiofibroma and, 822
Foramen rotundum, juvenile angiofibroma and, 822
Forehead
  blood supply, in paramedian forehead flaps, 1161
  examination, for paramedian forehead flaps, 1160, 1160f
  flaps, 1159
    for nasal reconstruction, 1146–1147
  management of skin cancers in, 1119–1120
  muscles, paralysis of, after frontal sinus cranialization, 764
  paraesthesia/numbness of, after brow lift, 1085
  paralysis, after facial translocation approach, 315
  rhytids, brow lift for, 1079–1080
Foreign bodies, of external auditory canal, 847–851.e1
  removal of
    alternative management plan for, 851
    common errors in technique for, 850–851
    complications of, 851
    contraindications to, 848
    history of, 847–848
    imaging for, 848
    indications for, 848
    instruments and equipment for, 848–849
    key anatomic landmarks for, 849
    monitoring for, 848
    physical examination for, 848
    positioning for, 848
    postoperative management of, 851

preoperative antibiotic prophylaxis for, 848
preoperative preparation for, 848
prerequisite skills for, 849
risks of, 849
technique of, 850, 850f
Forestier's disease, 520, 520f
Formal angiography
of cervicofacial transposition flaps, 1192
for radical neck dissection, 451
Fossa of Rosenmüller, anatomy of, 295
Four-dimensional contrast-enhanced CT (4D CT), in parathyroidectomy, 573
Four quadrant canal block, 841
Fourth-degree injury, of facial nerve, 943, 945f
Free flaps
anterolateral thigh, 356
for microvascular reconstruction, 1130–1131
fibular, for microvascular reconstruction, 1131
of floor-of-mouth resection, 217
gastro-omental, 355
jejunal, 355
after total laryngopharyngectomy, 128
for microvascular reconstruction, 1131–1132
musculocutaneous, rectus abdominis, for microvascular reconstruction, 1131
in orbital exenteration, 1056, 1056f, 1059
radial forearm, 356
in microvascular reconstruction, 1130

for scalp reconstruction, 1154–1155, 1154f
Free tissue harvest, anterolateral thigh, for total laryngopharyngectomy defect, 345–346, 346f
Free tissue transfer, in lip reconstruction, 194, 194f
Frey syndrome, after superficial parotidectomy, 616
Frontal balloon dilation, balloon sinus dilation and, 683
Frontal bone osteomyelitis, after frontal sinus cranialization, 764
Frontal craniotomy, in frontal sinus cranialization, 763f
Frontal embossment, after frontal sinus obliteration, 758
Frontal recess
basic endoscopic surgery of, 741–742, 741f–742f
posterior aspect of, in Draf III procedure, 746
Frontal sinus
anatomy of, 738
in cerebrospinal fluid leak, 771
posterior table of, in Draf III procedure, 746
rescue, 742
trephination of, 734–737.e1
uncinate attachment to, 738f
Frontal sinus cranialization, 760–766.e1
alternative management plan for, 765
anatomic landmarks for, 761
anesthesia for, 761
common errors in technique for, 764, 764f
complications of, 764–765
contraindications to, 761
editorial comment in, 765
historical perspective in, 760

history of, 760
imaging for, 761
indications for, 761
instruments and equipment for, 761
monitoring for, 761
operative period in, 761–764
operative risks of, 762
perioperative antibiotic prophylaxis for, 761
physical examination for, 760
positioning for, 761
postoperative management of, 764
postoperative period in, 764–765
preoperative period in, 760–761
preoperative preparation for, 761
prerequisite skills for, 761
surgical technique of, 762–763, 762f–763f
Frontal sinus mucocele, after frontal sinus cranialization, 764
Frontal sinus obliteration, 752–759.e1, 750
alternative management plan for, 758
anatomic landmarks for, 755
anesthesia for, 754
common errors in technique for, 757
complications of, 757–758
contraindications to, 754
editorial comment in, 758–759
history of, 752–753
imaging for, 753–754, 753f–754f
indications for, 754

instruments and equipment for, 754–755
monitoring for, 754
operative period in, 754–757
operative risks of, 755
perioperative antibiotic prophylaxis for, 754
physical examination for, 753

postoperative management of, 757
postoperative period in, 757–758
preoperative period in, 752–754
preoperative preparation for, 754
prerequisite skills for, 755
surgical technique of, 755–757, 755f–756f
Frontal sinus outflow tract, in frontal sinus obliteration, 755
Frontal sinus recess dissection, of anterior and posterior ethmoid artery ligation, 664
Frontal sinus surgery, endoscopic, 738–743.e1
alternative management plan for, 743
anesthesia for, 739
common errors in technique for, 742
complications of, 743
contraindications to, 739
history of, 738
imaging for, 738–739
indications for, 739
instruments and equipment for, 739
key anatomic landmarks for, 739, 740f
monitoring for, 739

operative period in, 739–742
operative risk of, 740
physical examination for, 738
positioning for, 739
postoperative management of, 743
postoperative period in, 743
preoperative period in, 738–739
preoperative preparation for, 739
prerequisite skills for, 739–740
surgical technique of, 740
Frontal sinusitis, 736f, 739
Frontalis muscle, Botox cosmetic injections of, 1104
"Frontolateral partial laryngectomy," 99
Frown lines, Botox cosmetic infections of, 1104, 1104f
Frozen sections, intraoperative, for skin cancer of head and neck management, 1121
Fujita system, for level of airway obstruction, 401
Full thickness nasolabial transposition flap, in lip reconstruction, 194
Full-thickness skin grafts (FTSGs), 1207
harvest, 1211
for helical defects, 1119
for nasal reconstruction, 1143, 1144f
for skin cancer of head and neck management, 1119
Functional endoscopic examination of swallowing (FEES)
for subglottic stenosis, 1363
Functional endoscopic sinus surgery (FESS), 698
oroantral fistula and, 703, 704f
Furlow palatoplasty (double-opposing Z-plasty), 1461, 1464–1465, 1464f

G

Galea, in frontal sinus obliteration, 755
Gamma Knife system, 1021–1022, 1022f
Gastric transposition, for cervical esophagus cancer, 353–354, 355f
Gastro-omental free flap, for cervical esophagus cancer, 355
Gastroesophageal reflux disease, laryngomalacia and, 1360
Gastrografin, in esophagoscopy and hypopharyngoscopy, 318–319
Gastropharyngeal reflux, acquired laryngeal stenosis from, 63, 64f
Gene expression profiling (GEP), for melanoma, 1116
General endotracheal anesthesia (GETA), vocal fold injection under, 22
Genial tubercles, genioglossus advancement and, 401
Genioglossus advancement, 401–406.e1
  alternative management plan for, 406
  anatomic landmarks for, 402–403
  anesthesia for, 402
  common errors in technique for, 405
  complications of, 405–406
  contraindications to, 402
  imaging for, 402
  indications for, 402
  instruments and equipment for, 402
  monitoring for, 402
  operative period in, 402–405
  operative risks of, 403

anterolateral thigh free flap in, 1130–1131
common errors in technique for, 1132
contraindications to, 1129
fibular free flap for, 1131
history of, 1125
imaging for, 1125
indications for, 1125–1129, 1126f–1129f
instruments and equipment for, 1130
jejunal free flap for, 1131–1132
key anatomic landmarks for, 1130
operative period in, 1130–1132
perioperative antibiotic prophylaxis for, 1130

physical examination, 1125
positioning for, 1130
postoperative management of, 1132
preoperative period, 1125–1130
preoperative preparation for, 1130
prerequisite skills for, 1130
radial forearm free flap (RFFF) in, 1130
rectus abdominis free musculocutaneous flap and DIEP flaps, 1131
risks of, 1130
scapular and parascapular fasciocutaneous and osteocutaneous flaps in, 1131
technique for, 1130–1132
nodal drainage patterns of, 481f
palpation of, in esophagoscopy and hypopharyngoscopy, 318
reconstruction, 1207, 1214
skin cancer of
alternative plan for, 1123–1124
anesthesia for, 1117
average cost of, by different methods, 1122t
common errors in technique for, 1118–1120
complications of, 1122–1123
considerations for, 1118–1120
contraindications to, 1114
evaluation of surgical margins and pathology interpretation in, 1121–1122
histopathology of, 1114–1115
history of, 1112–1114
imaging for, 1114

indications for, 1114
instruments and equipment for, 1118
management of, 1112–1124.e1
open wounds in, 1120–1121
operative period in, 1117–1122
perioperative antibiotic prophylaxis for, 1118
physical examination for, 1114
positioning for, 1118
postoperative, 1122
preoperative preparation for, 1114–1117
risks of, 1122
surgery, pectoralis major musculocutaneous flap in, 1186–1190, 1187f
Headache
after acoustic neuroma surgery, 965
after vertigo surgery, 1014
Hearing degradation, in Vibrant Soundbridge device, 934
Hearing devices, bone-anchored, 919–926.e1
alternative management plan for, 925
anesthesia for, 920
common errors in technique for, 924
contraindications to, 920
history of, 919
imaging for, 919
indications for, 920
instruments and equipment, 921
key anatomic landmarks for, 921
monitoring for, 921
operative period in, 920–924

operative risks of, 921
perioperative antibiotic prophylaxis for, 921
physical examination for, 919
positioning for, 920
postoperative management of, 924–925
postoperative period in, 924–925
preoperative period in, 919–920
prerequisite skills for, 921
surgical technique of, 921–924, 922f–924f
Hearing loss
after acoustic neuroma surgery, 965
after facial translocation approach, 315
after intratympanic gentamicin, 843
after middle ear reconstruction, 1445
in cerebrospinal fluid, otorrhea and encephalocele, 998
conductive
after middle ear reconstruction, 1446
in middle ear malformations, 1440
in otosclerosis, 902
due to stereotactic radiosurgery, 1025
in facial nerve decompression, 950
in facial nerve tumors, 958
mixed, in otosclerosis, 902
in petrous apex, lesion of, 992
sensorineural, from otosclerosis, 909
in superior semicircular canal dehiscence, 1019
in X-linked gusher syndrome, 1440
Hearing preservation, in temporal bone trauma, 1003, 1003f

Helical rim advancement flap, for helical defects, 1119, 1120f
Hematologic conditions, in adenoidectomy, 1342
Hematoma
after frontal sinus cranialization, 764
after frontal sinus obliteration, 757
after mastoid surgery, 917
after minimally invasive video-assisted thyroidectomy, 540
after nerve graft techniques, 1246
after of floor-of-mouth resection, 217
after open thyroidectomy, 533
after orbital exenteration, 1058
after retropharyngeal neck dissection, 467
after superficial parotidectomy, 616
after surgical management of ranula, 599
auricular, 841–842
in brow lift, 1084–1085
cervical, after parathyroidectomy, 569
in cochlear implantation, in adults, 940–941
complications of oroantral fistulas, 703
facelift and, 1091, 1093f
hyoid suspension and, 397
modified radical neck dissection and, 448
of orbit, in external ethmoidectomy, 726
otoplasty and, 1484
in pediatric cochlear implantation, 1454
radical neck dissection and, 455
Hemiglossectomy, 196
Hemilaryngectomy, 101b

Hemitransfixion incision, in nasal septum perforation, 643–644
Hemodynamic instability, in deep neck infection, 517
Hemorrhage
after acoustic neuroma surgery, 965
after adenoidectomy, 1345
after Caldwell-Luc operation, 698
after cleft palate repair, 1467
after cranioplasty, 1235f, 1239
after Draf III procedure, 750
after facial translocation approach, 315
after inferior maxillectomy, 234
after inferior turbinate surgery, 652
after middle turbinate surgery, 652
after nasal septum perforation, 645
after nerve graft techniques, 1245–1246
after parathyroid hormone monitoring, 564
after percutaneous tracheostomy, 150
after prestyloid parapharyngeal space tumor excision, 473
after reoperative parathyroidectomy, 581
after rib graft, 1231
after septoplasty, 638
after skull base reconstruction, 837
after surgical management of ranula, 599
after transoral CO_2 laser microsurgery, 90
after transoral robotic surgery, 260
after vertical partial laryngectomy, 105
airway, in tracheal stenosis, 1407
in cerebrospinal fluid, otorrhea and encephalocele, 999

as complication of supraglottic laryngectomy, 97
endoscopic nasopharyngectomy and, 291
in excision of carotid body tumors, 495
during office-based procedures, of salivary glands, 586
during open tracheostomy, 141
oral, after retropharyngeal neck dissection, 467
postoperative, in submandibular gland excision, 611
from pterygoid venous plexus, in robotic-assisted nasopharyngectomy, 298–299
from sigmoid sinus, in mastoid surgery, 914
in skin cancer of head and neck management, 1122
soft palate surgery and, 264
in sphenopalatine artery ligation, 659
in surgical treatment of BVFI, 55
in thyroglossal duct cyst, 1412
vocal fold, in vocal fold injection, 25
Hemostasis
assessment of, 666
in nasal septum perforation, 643
Hereditary hemorrhagic telangiectasia (HHT)
diagnosis of, 669t
prevalence of, 669t
surgical management of, 668–673.e1
alternative management plan for, 672
anesthesia for, 670
common errors in technique for, 672
complications of, 672
contraindications to, 670

history of, 668
imaging for, 669
indications for, 670
instruments and equipment for, 670
key anatomic landmarks for, 670
monitoring for, 670
operative period in, 670–672
operative risks of, 670
perioperative antibiotic prophylaxis for, 670
physical examination for, 669, 669f
positioning for, 670
postoperative management of, 672
postoperative period in, 672
preoperative period in, 668–670
preoperative preparation for, 670
prerequisite skills for, 670
technique for, 671–672
High-low-high technique, in rhinoplasty, 1064, 1065f
High-pressure hydrocephalus, in cerebrospinal fluid leak, 772, 772f
High-resolution computed tomography (HRCT), for cerebrospinal fluid leak, 768–769
High-resolution impedance manometry, in UES dysfunction, 324
HNS, *See* Hypoglossal nerve stimulation therapy.
Hoarseness, in glomus tumors, 980
Hockey stick incision, for radical neck dissection, 453, 453f
Horizontal forehead rhytids, Botox cosmetic injections of, 1104
Horizontal partial laryngectomy, 92–98.e1, 93f
alternative management plan for, 98

contraindications to, 94
history of, 92–93
imaging for, 93–94
indications for, 94
instruments and equipment for, 95
key anatomic landmarks for, 95
monitoring for, 95
operative risks of, 95
perioperative antibiotic prophylaxis for, 95
physical examination for, 93
positioning for, 94
postoperative management of, 96–97
postoperative period in, 96–97
preoperative period in, 92–93
preoperative preparation for, 94
prerequisite skills for, 95
surgical technique of, 95–96
Horner's syndrome, after retropharyngeal neck dissection, 468
House-Brackmann Facial Nerve Grading System, 946t
HPV quadrivalent vaccine, for recurrent respiratory papillomatosis, 18–19
Human papillomavirus (HPV)
recurrent respiratory papillomatosis caused by, 15, 1381
role of, 187
Hyaluronic acid fillers, 1107–1110, 1108f
with cannula/microcannula, 1109
complications of, 1110
contraindications and adverse reactions to, 1107

dilution of, 1109
hyaluronidase and, 1111
indications for, 1107
injection pattern strategies for, 1109
on-label uses of, 1109, 1110f
planning for, 1107
postprocedural care for, 1110
precautions for, 1109
vascular occlusion and, 1110–1111
Hyaluronidase, hyaluronic acid fillers and, 1111
Hydrocephalus
after cranioplasty, 1235f, 1239
otitic, otitis media and, 878
from stereotactic radiosurgery, 1025
Hydrodissection, in nasal septum perforation, 643
Hyoid bone, 396
pharyngectomy and, 280
superselective neck dissection and, 432
Hyoid bone position, in advanced palatal surgery, 379
Hyoid suspension, operative otolaryngology, 394–400.e1, 395f
alternative management plan for, 398
anatomic landmarks for, 396
anesthesia for, 395
complications of, 397
contraindications to, 395
history of, 394
imaging for, 395
indications for, 395, 395f

instruments and equipment for, 396
monitoring for, 396
operative period in, 395–397
operative risks of, 396
perioperative antibiotic prophylaxis for, 395–396
physical examination for, 394
positioning for, 395
postoperative management of, 397
postoperative period in, 397–398
preoperative period in, 394–395
preoperative preparation for, 395
prerequisite skills for, 396
procedures for, 395
surgical technique of, 396–397, 396f, 398f–399f
Hyperinflation, during office-based procedures, of salivary glands, 587
Hypernasality, 1459–1460
Hyperparathyroidism
after reoperative parathyroidectomy, 581
primary, 562, 565
Hypertrophic scarring
after minimally invasive video-assisted thyroidectomy, 539
after rib graft, 1231
after superficial parotidectomy, 616
CO_2 lasers for, 1101
Hypesthesia, in orbital decompression, 1042
Hypocalcemia
after parathyroidectomy, 570, 577
after reoperative parathyroidectomy, 581

after total laryngopharyngectomy, 128
in hypopharyngeal defect reconstruction, 348
Hypoglossal-facial graft, with great auricular nerve, 1262–1263
Hypoglossal-facial transposition, 1261f, 1262
Hypoglossal nerve
damage to, after floor-of-mouth resection, 217
injury to, during laryngectomy, 281
pharyngectomy and, 280
superselective neck dissection and, 432
Hypoglossal nerve stimulation therapy, 388–393.e1
alternative management plan for, 393
anesthesia for, 391
common errors in technique for, 393
complications of, 393
history of, 388–389
imaging for, 390
implantable device for, 391, 391f
indications for, 390, 390f
instruments and equipment for, 391
key anatomic landmarks for, 391
monitoring for, 391
operative period in, 391–393, 391f
operative risks of, 391
perioperative antibiotic prophylaxis for, 391
physical examination for, 389–390
positioning for, 391
postoperative period in, 393
potential success of, 388

preoperative period in, 388–391
preoperative preparation for, 391
relative contraindications to, 390–391
surgical technique of, 391–393
completion of, 393
cuff electrode placement in, 392, 392f
incision planning in, 391–392, 392f
preparation and draping in, 392
pulse generator placement in, 392
respiratory sensor placement in, 392–393
Hypoparathyroidism
after minimally invasive video-assisted thyroidectomy, 540
after thyroid surgery, 560
Hypopharyngeal cancer, 336
total laryngopharyngectomy in, 124
Hypopharyngeal collapse, hyoid suspension and, 394
Hypopharyngeal defect reconstruction, 342–349.e1
alternative management plan for, 348
anesthesia for, 344
common errors in technique for, 347–348
complications of, 348
contraindications to, 344
history of, 343–344
imaging for, 344
instruments and equipment for, 345
key anatomic landmarks for, 345
monitoring for, 344
morbidity in, 348

mortality in, 348
operative period in, 344–348
operative risks of, 345
perioperative antibiotic prophylaxis for, 344
physical examination for, 344
positioning for, 344
postoperative management of, 348
postoperative period in, 348
preoperative period in, 342–344, 343f, 343t
preoperative preparation for, 344
prerequisite skills for, 345
speaking and, 348
surgical technique of, 345–347, 346f–347f
swallowing and, 348
Hypopharyngoscopy, 317–322.e1
alternative management plan for, 321
complications of, 321, 321f
contraindications to, 319
history of, 317
imaging for, 318–319, 318f
operative period in, 319–320
physical examination for, 318, 318f
postoperative management of, 321
postoperative period in, 321–322
preoperative period in, 317–319
preoperative preparation for, 319
Hypopharynx, 279, 335, 342, 342f
cancer of, transoral CO_2 laser microsurgery for, 87f, 89–90

penetrating trauma to, 329–334.e1
anesthesia for, 330
common errors in technique for, 332–333
complications of, 333
contraindications to, 330
with diversion, 332, 333f
history of, 329
imaging for, 330
indications for, 330
instruments and equipment for, 330–331
key anatomic landmarks for, 331
in large or delayed defects, 332, 332f
management of, 329
medical management of, 329
monitoring for, 330
operative period in, 330–333
operative risks of, 331
perioperative antibiotic prophylaxis for, 330
physical examination for, 329
positioning for, 330
postoperative management of, 333
postoperative period in, 333
preoperative period in, 329–330
preoperative preparation for, 330
prerequisite skills for, 331
in small and early-recognized defects, 331–332, 331f–332f
during special circumstances, 332
surgical management of, 330

squamous cell carcinoma of, 279
Hypotension, after esophagoscopy and hypopharyngoscopy, 321
Hypothyroidism, pharyngectomy and, 284

I

Iatrogenic chronic sinusitis, after endonasal approach, to sella and parasellar areas, 780

Iatrogenic facial nerve injury, facial nerve decompression in, 946–947

Idiopathic tracheal stenosis, tracheal resection for, 157

Immunosuppression, chronic, skin cancer of head and neck associated with, 1113

Implantable device, for hypoglossal nerve stimulation therapy, 391, 391f

Implantable middle ear devices, 927–937.e1

Esteem Implant, 927, 928f

alternative management plan for, 931

anesthesia for, 928

audiogram in, 927–928

battery change technique for, 931

common errors in technique for, 930–931

complications of, 931

contraindications to, 928

history of, 927

indications for, 928

instruments and equipment for, 928–929

key anatomic landmarks for, 929

monitoring for, 928

operative period in, 928–930

operative risks of, 929

perioperative antibiotic prophylaxis for, 928

physical examination for, 927

positioning for, 928

postoperative management of, 931

postoperative period in, 931
preoperative period in, 927–928
preoperative preparation for, 928
prerequisite skills for, 929
surgical technique of, 929–930, 929f–930f
Maxum Hearing Implant System, 935, 935f
alternative management plan for, 937
anesthesia for, 936
audiogram in, 935
common errors in technique for, 936
complications of, 937
contraindications to, 935
history of, 935
imaging for, 935
indications for, 935
instruments and equipment for, 936
key anatomic landmarks for, 936
monitoring for, 936
operative period in, 936
perioperative antibiotic prophylaxis for, 936
physical examination for, 935
positioning for, 936
postoperative management of, 937
postoperative period in, 937
preoperative period in, 935
preoperative preparation for, 935
prerequisite skills for, 936
surgical technique of, 936, 936f

Vibrant Soundbridge device, 932, 932f
alternative management plan for, 934
anesthesia for, 933
audiogram in, 933
common errors in technique for, 934
complications of, 934
contraindications to, 933
history of, 933
imaging for, 933
indications for, 933
instruments and equipment for, 933
key anatomic landmarks for, 933
monitoring for, 933
operative period in, 933–934
operative risks of, 933
perioperative antibiotic prophylaxis for, 933
physical examination for, 933
positioning for, 933
postoperative management of, 934
postoperative period in, 934
preoperative period in, 933
preoperative preparation for, 933
prerequisite skills for, 933
surgical technique of, 933–934, 934f
Implants
complications of, after medialization laryngoplasty, 31, 36
material in, for medialization laryngoplasty, 28
osseointegrated, 1315–1324.e1

alternative management plan for, 1323
anesthesia for, 1318
common errors in technique for, 1322
complications of, 1323
contraindications to, 1318
history of, 1315–1317
imaging for, 1318
indications for, 1318
instruments and equipment for, 1319, 1319f
key anatomic landmarks for, 1319–1320, 1319f–1320f
monitoring for, 1318–1319
operative period in, 1318–1322
operative risks of, 1322
perioperative antibiotic prophylaxis for, 1318
positioning for, 1318
postoperative management of, 1322–1323
preoperative period in, 1315–1318, 1316f–1317f
preoperative preparation for, 1318
prerequisite skills for, 1320
surgical technique of, 1320–1322, 1321f–1322f
In situ split calvarial graft, 1221
Inadvertent injury, in excision of carotid body tumors, 495–496
Incision(s)
for anterior transcervical approach to cervical spine, 521, 522f
cervical, for operative otolaryngology, of massive and substernal goiter, 549f
for deep neck abscesses, 516, 516f
for frontal sinus trephination, 736, 737f

gingivobuccal, 708
for laryngeal trauma surgery, 48
for laryngocele excision, 41, 42f
for lateral canthotomy, 1052, 1052f
lip-splitting, for segmental mandibulectomy, 1275
for lower eyelid transconjunctival (preseptal) blepharoplasty, 1072
for maxillectomy, 714, 715f
for medialization laryngoplasty, 28
for midfacial degloving procedure, 708
mucosal, for phonomicrosurgery, 11, 11f
planning for
for facelift, 1088, 1089f
in hypoglossal nerve stimulation therapy, 391–392, 392f
skin, for total glossectomy, 205f
for superficial parotidectomy, 614, 615f
for tracheal resection, 159f
transcolumellar, in rhinoplasty, 1062, 1063f
for two-flap palatoplasty with intravelar veloplasty, 1462
for tympanomeatal flap, 1442, 1442f
for uvulopalatopharyngoplasty, 373, 373f
Incudomalleal joint fusion, 1442, 1445f
Incudostapedial joint, fibrous, 1442, 1444f
Incus
anomalies of, 1442
problems with, ossicular chain reconstruction for, 894–896, 895f–898f
Indole 3-carbinol, for recurrent respiratory papillomatosis, 18
Infection
after cranioplasty, 1239

after foreign body removal, 851
after inferior maxillectomy, 234
after laryngeal surgery, 81
after nasal septum perforation, 645
after nerve graft techniques, 1246
after orbital exenteration, 1058
after percutaneous tracheostomy, 150
after superficial parotidectomy, 616
in brow lift, 1085
in cochlear implantation, in adults, 941
complications of oroantral fistulas, 703
modified radical neck dissection and, 448
postoperative, after surgical management of ranula, 599
radical neck dissection and, 455
in snoring procedures, 364
from transoral laser microsurgery, 247, 247f
wound, in pediatric cochlear implantation, 1455
Infectious mononucleosis, tonsillectomy for, 1349
Inferior canthal crus, 1051
Inferior cantholysis
lateral canthotomy and, 1052
superior cantholysis after, 1053
Inferior maxillectomy, 227
alternative management plan for, 234
anesthesia for, 228
common errors in technique for, 231
complications of, 234
contraindications to, 228

history of, 227
imaging for, 228
indications for, 228
instruments and equipment for, 229
key anatomic landmarks for, 229
monitoring for, 228
perioperative antibiotic prophylaxis for, 228
physical examination for, 227–228
positioning for, 228
postoperative management of, 231–233
preoperative preparation for, 228
prerequisite skills for, 229
rehabilitation of patient with loss of oral-nasal separation in, 231–233, 232f–234f
risks of, 229
surgical technique of, 229–230, 229f–231f
Inferior meatus
in Caldwell-Luc operation, 696
nasolacrimal duct cyst in, 1333f, 1334
Inferior oblique injury, in blepharoplasty, 1070
Inferior orbit, surgical technique of, 1048
Inferior thyroid artery, 529
Inferior thyroid veins, 529
Inferior turbinate, surgical therapy for, 647
alternative techniques of, 652
complications of, 652
indication for, 648
key anatomic landmarks for, 649

long-term results of, 652
mucosal function in, 650
operative risks of, 650
technique of, 650–651
incision and elevation of, 650
outfracture of, 651, 651f
splint placement in, 651
submucosal resection of, 650, 650f
Inflammation, anterior transcervical approach and, 519
Informed consent, in otosclerosis, 902
Infracochlear approach, for cholesteatomas, 987–988, 987f
Infraorbital nerve
in Caldwell-Luc operation, 696, 698
injury to, in endoscopic middle meatal antrostomy, 689
juvenile angiofibroma and, 822
medial maxillectomy, injury from, 707
Infratemporal fossa (ITF)
in facial translocation approach, 308, 310f
surgical approaches to, 809–819.e1, 810t
alternate management plan for, 817
anatomic landmarks for, 811
anesthesia for, 810
antibiotic prophylaxis for, 811
common errors in technique for, 817
complications of, 817
contraindications to, 810
endoscopic endonasal approaches in, 817, 818f–819f
facial translocation approach in, 814, 815f–816f

Fisch lateral infratemporal fossa approaches in, 813–814, 814f
history of, 809
imaging for, 809
indications for, 810
instruments and equipment for, 811
monitoring for, 811
operative period in, 810–817
operative risks of, 811
physical examination for, 809
positioning for, 810–811
postauricular (transtemporal) approach in, 813, 814f
postoperative management of, 817
postoperative period in, 817
preauricular approach (infratemporal subtemporal approach) in, 811, 812f
preoperative period in, 809–810
preoperative preparation for, 810
prerequisite skills for, 811
surgical technique of, 811–817
Infratemporal skull base approach, for juvenile angiofibroma, 823
Injectable treatments, ideal patient for, 1103
Injection snoreplasty, for snoring, 365, 363–364, 364f
Innominate artery rupture, after open tracheostomy, 144
Insects, in external auditory canal, 847
removal of, 850
Inside out approach, in Draf III procedure, 746–747, 746f–747f
Inspiratory stridor, laryngomalacia and, 1356
Intact canal wall mastoidectomy, in mastoid surgery, 915, 915f

Interarytenoid synechiae, lysis of, 55
Interferon, for recurrent respiratory papillomatosis, 18
Internal carotid artery (ICA)
injury of, after endonasal approach, to sella and parasellar areas, 780
in robotic-assisted nasopharyngectomy
anatomy of, 295
injury to, 299
supply, in paramedian forehead flaps, 1161
Internal jugular vein, 443
Internal mammary artery (IMA), 1181f
Internal maxillary artery, 659
Interposition graft, 1242, 1242f
Interstitial hematomas, skin cancer of head and neck and, 1123
Intracapsular tonsillectomy, 1353
Intraconal abscess, 1048
Intracranial bleeding, in vertigo, after surgery, 1014
Intracranial complications, of otitis media, 874–879.e1, 874f, 875t
brain abscess and, 877–878
epidural abscess and, 876, 876f
history of, 874
imaging for, 875
lateral sinus thrombosis and, 876, 877f
otitic hydrocephalus and, 878
petrous apicitis/Gradenigo's syndrome and, 878–879
physical examination for, 875
postoperative care/complications of, 878
subdural abscess (empyema) and, 876–877
surgical technique of, 876

Intracranial ex vivo split calvarial graft, 1221
Intracranial hemorrhage
after surgery of the anterior cranial base, 789
in temporal bone trauma, 1004
Intracranial infection, in pericranial scalp flap, 1170
Intranasal midline nasal mass, 1337
Intraocular pressure, lateral canthotomy and, 1051
Intraoperative fluoroscopy, in bronchoscopy, 131
Intraoperative medialization laryngoplasty, 33–38.e1
alternative management plan for, 36
common errors in technique for, 36
complications of, 36
contraindications to, 34
history of, 33
indications for, 33–34
instruments and equipment for, 34–35
operative period in, 34–36
physical examination for, 33
positioning for, 34
postoperative management of, 36
postoperative period in, 36
preoperative period in, 33–34
surgical technique of, 34f–35f, 35–36
Intraoral approach, of submandibular gland excision, 610–611
Intraoral defects, 1315–1316
Intraoral therapy, 701, 702f
Intraoral wounds, management of, 507
Intratympanic injections, 843–845, 844f

Intubation
acquired laryngeal stenosis from, 61–62
injury, in phonomicrosurgery, 9
in modified radical neck dissection, 445
Inverted papilloma, 629
Irrigation, for traumatic soft tissue and vascular injuries, to neck, 506
Isadora Duncan syndrome, 45
Island deltopectoral flap, 1184f
Island flap, in paramedian forehead flaps, 1162
Isotretinoin, peels and, 1096

J

Jejunal free flap
after total laryngopharyngectomy, 128
for cervical esophagus cancer, 355
for microvascular reconstruction, 1131–1132
Jelly rolls, Botox cosmetic injections for, 1104
Jessner peel, 1099
Jewelry, in external auditory canal, 847
removal of, 849, 849f
Jugular bulb, high-riding, 1444, 1447f
Juvederm, 1102
Juvenile angiofibroma, 820–825.e1
alternative management plan for, 824
anatomic landmarks for, 822, 822f
anesthesia for, 821
antibiotic prophylaxis for, 821
common errors in technique for, 823
complications of, 824
contraindications to, 821
endoscopic endonasal approach for, 822–823
history of, 820
imaging for, 820–821, 820f–821f
indications for, 821
infratemporal skull base approach for, 823
instruments and equipment for, 822
monitoring for, 822
operative period in, 820–823
operative risks of, 822

physical examination for, 820
positioning for, 821
postoperative management of, 824
postoperative period in, 824
preoperative preparation for, 821
prerequisite skills for, 822
staging of, 821, 822t
surgical technique of, 822–823
transmaxillary approach for, 823
Juvenile nasopharyngeal angiofibromas (JNAs), maxillectomy and, 713
Juvenile otosclerosis (JO), 1446

K

Karapandzic flap, for large tumor of lip, 192, 193f
Keel, for laryngeal trauma repair, 48, 49f
Keratin "pearl," in canal cholesteatoma, 860, 862f
Keratin plug, in keratosis obturans, 860, 861f
Keratoacanthoma, determining surgical margins in, 1115
Keratosis obturans, 860–866.e1, 861f
  alternative management plan for, 864
  anesthesia for, 861–862
  common errors in technique for, 864
  complications of, 864
  history of, 864
  imaging for, 860–861
  instruments and equipment for, 862
  key anatomic landmarks, 862
  physical examination for, 860
  positioning for, 862
  postoperative management of, 864
  preoperative period in, 860–861
  prerequisite skills for, 862
  risks of, 862
  surgical technique of, 862–863, 863f
Keros classification, olfactory fossa of depth, 719f
Kerrison rongeur
  in anterior antrostomy, 696, 697f
  sphenopalatine foramen and, 657
    enlargement of, 658f
  in styloid process surgery, 267, 268f

L

Lacrimal duct

injury to, after inferior turbinate surgery, 652

transection of, in medial maxillectomy and lateral rhinotomy, 706

Lagophthalmos, after blepharoplasty, 1076

Lamina papyracea, in Draf III procedure, 746

Large glomus jugulare tumors, surgical technique of, 979–980, 980f

Laryngeal air sacs, 43

Laryngeal and subglottic stenosis, after recurrent respiratory papillomatosis surgery, 1385

Laryngeal cancer

horizontal partial laryngectomy for, 92

laryngocele and, 43

supracricoid partial laryngectomy for, 112

total laryngectomy for, 118

Laryngeal cleft repair, 1372–1380.e1

contraindications to, 1373

endoscopic, 1375–1376, 1375f

history of, 1372–1373

imaging for, 1373, 1374f

indications for, 1373

injection of, 1373–1375

anesthesia for, 1373

common errors in technique for, 1374

complications of, 1374–1375

instruments/equipment for, 1374

positioning for, 1374

postoperative care for, 1374

technique for, 1374, 1374f
open, 1376, 1377f–1378f
operative period in, 1373–1379
physical examination for, 1373
preoperative period in, 1372–1373
Laryngeal electromyography, for bilateral vocal fold immobility, 53
Laryngeal nerve
injury to, in penetrating trauma, 333
recurrent, injury to
after parathyroidectomy, 570
after thyroid surgery, 560
Laryngeal nerve monitoring, in thyroid surgery, 550
Laryngeal office-based procedures, 1–5.e1
alternate management plan for, 5
anesthesia for, 2
common errors in technique for, 4
complications of, 5
contraindications to, 1–2
history of, 1
indications for, 1
instruments and equipment for, 2–3, 2f
key anatomic landmarks for, 3
monitoring for, 2
operative period in, 2–4
operative risks of, 3
patient factors in, 2
physical examination for, 1
positioning for, 2

postoperative period in, 4–5
postoperative/postprocedure management in, 4
preoperative antibiotic prophylaxis, 2
preoperative period in, 1–2
preoperative preparation for, 2
prerequisite skills for, 3
surgical techniques for, 3–4
Laryngeal release procedures, for tracheal resection, 161
Laryngeal stenosis, acquired, 60–82.e1
alternative management plan for, 81
antibiotic prophylaxis for, 66
common errors in technique for, 76
complications of, 77–81
contraindications to, 65
corticosteroids for, 67
dilatation for, 67
electromyography for, 64
endoscopic microsurgery for, 67
glottic, 69–76, 70f
posterior, 73, 74f–75f
imaging for, 65, 65f
indications for, 65
instruments and equipment for, 66
mitomycin C for, 67
operative period in, 65–76
operative risks of, 66, 66f
positioning for, 65–66
postoperative management of, 76–77

postoperative period in, 76–81
preoperative period in, 61–65
preoperative preparation for, 65
prerequisite skills for, 66
stenting for, 67–68, 68f
subglottic, 77f, 73–76, 76f–80f
supraglottic, 68–69
videolaryngoscopy for, 64
Laryngeal trauma, 44–51.e1
alternative management plan for, 51
anesthesia for, 47
antibiotic prophylaxis for, 47
blunt, 44–45
in children, 44
common errors in technique for, 50
complications of, 50–51
contraindications to, 47
cranial nerve injury in, 46
history of, 45–46
imaging for, 46, 46f–47f
indications for, 46–47
instruments and equipment for, 47
key anatomic landmarks for, 47
monitoring for, 47
operative period in, 47–50
operative risks of, 48
penetrating, 45
physical examination for, 46

positioning for, 47
postoperative management of, 50
preoperative period in, 45–47
preoperative preparation for, 47
stenosis after, 50
strangulation as, 45
surgical techniques for, 48–50, 48f–49f
vascular injury in, 46
Laryngectomy, 201
frontolateral partial, 99
horizontal partial, 92–98.e1
open supraglottic, 68–69, 68f–69f, 71f–73f
patient referred for, 212f
supracricoid, postoperative edema after, 98
supracricoid partial, 107–112.e1
See also Supracricoid partial laryngectomy
supraglottic
common errors in technique for, 96, 96f
complications of, 97–98, 97f
surgical technique of, 95–96, 95f–96f
total, 118–123.e1
See also Total laryngectomy
pharyngectomy and, 280, 282, 282f
tracheostomal stenosis after, 170–174.e1, 171f
voice restoration after, 175–181.e1
vertical partial, 99–106.e1
See also Vertical partial laryngectomy
Laryngocele

development of, 43
excision of, 39–43.e1, 39f
alternative management plan for, 43
anesthesia for, 41
antibiotic prophylaxis for, 41
common errors in technique for, 42–43
complications of, 43
contraindications to, 40
history of, 40
imaging for, 40
indications for, 40
instruments and equipment for, 41
key anatomic landmarks for, 41
monitoring for, 41
operative period in, 41–43
operative risks of, 41
physical examination for, 40
positioning for, 41
postoperative management of, 43
postoperative period in, 43
preoperative period in, 39–40
preoperative preparation for, 40
surgical technique of, 41–42
laryngeal cancer and, 43
Laryngofissure, for laryngeal trauma surgery, 48, 48f
Laryngomalacia, surgical management of, 1356–1361.e1, 1357f
alternative treatment for, 1360
anesthesia for, 1358

common mistakes in, 1360
complications of, 1360
contraindications to, 1358
equipment for, 1358
history of, 1356–1357
imaging/further diagnostic evaluation for, 1358
indications for, 1358
key anatomic landmarks for, 1359
medication prophylaxis for, 1358
monitoring for, 1358
operative period in, 1358–1360
operative risks of, 1359
physical examination for, 1358
positioning for, 1358
postoperative care for, 1360
postoperative period in, 1360
preoperative period in, 1356–1358
preoperative preparation for, 1358
prerequisite skills for, 1359
technique for, 1359–1360, 1359f–1360f
Laryngopharyngectomy
for cervical esophagus cancer, 353, 354f
pharyngectomy and
partial, 280
total, 280, 282–283, 282f–283f
total, 124–130.e1, 337–338
vertical partial, 340
Laryngopharyngoesophagectomy (LPE), total, for cervical esophagus

cancer, 353
Laryngoplasty, medialization
arytenoid adduction and, 27–32.e1
intraoperative, 33–38.e1
Laryngoscopy
flexible, for vocal fold injection, via microlaryngoscopy, 21
flexible fiberoptic, for pharyngectomy, 279
microsuspension
for laryngocele excision, 41
for phonomicrosurgery, 9f
neonatal, in EXIT procedure, 1389
suspension device, for phonomicrosurgery, 9
Laryngospasm, vocal fold injection and, 25
Laryngotracheal complex, cancer and, 93
Laryngotracheal reconstruction, for subglottic stenosis
double-stage, 1368, 1368f
single-stage, 1367–1368, 1367f–1368f
Laryngotracheal separation (LTS), 1372–1380.e1, 152–156.e1, 153f, 153b
alternative management plan for, 155–156
anesthesia for, 153, 1376
common errors in technique for, 154, 1378
complications of, 155, 1379
contraindications to, 152, 1373
history of, 152, 1372–1373
imaging for, 152, 1373
indications for, 152, 1373
instruments and equipment for, 153, 1376
key anatomic landmarks for, 153

monitoring for, 153
operative period in, 153–154, 1373–1379
operative risks of, 153
perioperative antibiotic prophylaxis for, 153
physical examination for, 152, 1373
positioning for, 153, 1376
postoperative care for, 1378
postoperative management of, 154–155
postoperative period in, 154–156
preoperative period in, 152–153, 1372–1373
preoperative preparation for, 153
prerequisite skills for, 153
surgical technique of, 154, 154f–155f, 1376–1378, 1379f
Larynx, 44, 44f, 60
in drug-induced sedated endoscopy, 367
examination of, for maxillary swing/transpalatal/midface degloving with Le Fort I osteotomy approach, 302
saccular cyst of, 39
See also Laryngocele
Laser airway fire
in BVFI, 55
in phonomicrosurgery, 9
Laser burns, after transoral CO_2 laser microsurgery, 90
Laser cordectomy, classification of, 86t, 87
Laser destruction, for skin cancer of head and neck, 1123
Laser injury, after laryngeal surgery, 81
Laser surgery
for laryngocele, 41, 42f

for recurrent respiratory papillomatosis, 1383
Lasers
facial resurfacing and
ablative, 1095–1096, 1100–1101
alternative management plan for, 1101
common errors in technique for, 1101
complications of, 1101
contraindications to, 1097
fractional, nonablative, 1099–1100, 1100f
history of, 1095–1096
imaging for, 1096
indications for, 1096
instruments and equipment for, 1097
key anatomic landmarks for, 1098
monitoring for, 1097
nonablative, 1095–1097
perioperative prophylaxis for, 1097
physical examination for, 1096
positioning for, 1097
postoperative management of, 1101
preoperative period in, 1095–1097
preoperative preparation for, 1097
prerequisite skills for, 1098
risks of, 1098
for laryngeal office-based procedures, 1
transnasal, 4
Lateral canthal lines, Botox cosmetic injections of, 1104, 1105f
Lateral canthal tendon, 1051, 1052f

Lateral cephalometric radiograph
for genioglossus advancement, 402
for snoring, 360
Lateral chain fixation, ossicular chain reconstruction for, 893, 894f
Lateral crura, in conservative cephalic trim, 1066, 1066f
Lateral crural steal, in rhinoplasty, 1066
Lateral decubitus, in regional pedicle flap, 1200
Lateral oblique, for mandibular fractures, 1295
Lateral orbit, surgical technique of, 1048
Lateral palatal flap approach, in robotic-assisted nasopharyngectomy, 295–296, 296f
Lateral pharyngeal wall, in uvulopalatopharyngoplasty, 373
Lateral pharyngotomy, 270–271, 275–276, 276f
Lateral recess access, in endonasal approach, to sella and parasellar areas, 778–779, 778f–779f
Lateral rhinotomy
for congenital midline nasal masses, 1335
for medial maxillectomy, 708, 708f–709f, 710
Lateral sinus thrombosis, otitis media and, 876, 877f
Lateral tarsal strip, 1248
alternative management for, 1251
anesthesia for, 1250
complications of, 1251
contraindications to, 1249
history of, 1249
imaging for, 1249
indications for, 1249
instruments and equipment for, 1250

key anatomic landmarks for, 1250
monitoring for, 1250
operative period in, 1250–1251
operative risks of, 1250
perioperative antibiotic prophylaxis for, 1250
physical examination for, 1249
positioning for, 1250
postoperative management of, 1251
postoperative period in, 1251
preoperative period in, 1249–1250
preoperative preparation for, 1250
prerequisite skills for, 1250
surgical technique of, 1250–1251, 1251f
common errors in technique for, 1251
Lateral tarsoconjunctival onlay flap lower eyelid suspension, 1251, 1252f
alternative management for, 1253
anesthesia for, 1252
common errors in technique for, 1253
complications of, 1253
contraindications to, 1252
history of, 1252
imaging for, 1252
indications for, 1252
instruments and equipment for, 1252
key anatomic landmarks for, 1252
monitoring for, 1252
operative period in, 1252–1253
operative risks of, 1252

perioperative antibiotic prophylaxis for, 1252
physical examination for, 1252
positioning for, 1252
postoperative management of, 1253
postoperative period in, 1253
preoperative period in, 1252
preoperative preparation for, 1252
prerequisite skills for, 1252
surgical technique of, 1252, 1253f
Lateral temporal bone resection, for temporal bone, resection of, 970–971, 970f–971f
Lateral transthyroid pharyngotomy, 339
Lateral trapezius flaps, 1201
Lateralization, myringoplasty and tympanoplasty and, 888
Latissimus dorsi flap, 1202, 1204f
common errors in technique for, 1204
complications of, 1205
contraindications to, 1202
indications for, 1202
key anatomic landmarks for, 1202–1203
operative period in, 1202–1204
postoperative management of, 1204–1205
postoperative period in, 1204–1205
preoperative period in, 1202
surgical technique of, 1203–1204, 1203f–1205f
Le Fort, Rene, 1305
Le Fort I fracture, 1305, 1307f
Le Fort I osteotomy, for maxillomandibular advancement for obstructive

sleep apnea, 409–410
Lemierre syndrome
deep neck abscesses and, 516–517, 517f
tonsillectomy for, 1349
Lesser palatine artery, 263
Levator veli palatine muscle, 289
Lichen planus, oral, skin cancer of head and neck associated with, 1113
Lid distraction test, 1069
Lid-sparing technique, in orbital exenteration, 1055–1057
Lidocaine
with epinephrine
for external ear and canal anesthesia, 840
for medialization laryngoplasty, 28
for tympanic membrane anesthesia, 839
Life expectancy, skin cancer of head and neck management and, 1114
Ligasure, in tonsillectomy and tonsillotomy, 1351t
Linear accelerator (LINAC) systems, 1022–1023, 1023f
Lingual nerve
after transoral CO_2 laser microsurgery, 90
damage to, after floor-of-mouth resection, 217
Lingual nerve neuropraxia, after supraglottic transoral robotic surgery, 116
Lingual tonsillar hypertrophy, in obese patients, 384, 387
Lingual tonsillectomy
drug-induced sleep endoscopy and, 384
endoscopic, 384, 385f
instruments and equipment for, 386
for obstructive sleep apnea, 384

using coblator, 384, 385f, 386
using DaVinci robotic system, 386
using medrobotics system, 386–387
Lip cancer, 187–195.e1
alternative management plan for, 195
common errors in technique for, 194
complications of, 195
contraindications to, 188
excision of, 190f
history of, 188
imaging for, 188
indications for, 188
instruments and equipment for, 189
key anatomic landmarks for, 189
monitoring for, 189
operative period in, 189–194
operative risks of, 189
physical examination for, 188, 188f
positioning for, 189
postoperative management of, 194–195
postoperative period in, 194–195
preoperative period in, 188
preoperative preparation for, 188
prerequisite skills for, 189
risk of, 187
staging guidelines for, 187
surgical technique of, 189–194
Lip reconstruction, 189–194, 190f–191f

Lip resection, 189
Lip-splitting incision, for segmental mandibulectomy, 1275
"Lip switch" flap, for large lip tumor excision, 190
Lip wounds, management of, 507
Lips
  cancer, skin, management of, 1119
  lymphatic drainage of, 188f
Local anesthesia
  for anterior and posterior ethmoid artery ligation, 665
  for traumatic soft tissue and vascular injuries, to neck, 505–506
Local flaps
  in orbital exenteration, 1056
  for scalp reconstruction, 1152–1153, 1153f
  skin grafts with, 1212
Long-term dysphagia, in volumetric tongue-base reduction, 387
Longus colli tendinitis, deep neck abscesses and, 517, 518f
Loose areolar tissue, in scalp reconstruction, 1151
Loss of airway, in drug-induced sedated endoscopy, 369
Lower eyelid tone, 1069
Lower jugular lymph nodes, 436
Lower lid malposition, blepharoplasty and, 1077
Lower trapezius flaps, 1201, 1202f
Lowry technique, 1436
Ludwig's angina, deep neck abscesses and, 514, 515f
Lumbar drain, in facial translocation approach, 313
Lymphadenectomy, of lip cancer, 189
Lymphoproliferative disorders, acquired laryngeal stenosis from, 62
Lynch incision, of anterior and posterior ethmoid artery ligation, 665,

665f

M

"M" suture, 1090, 1092f

Magnetic resonance angiography (MRA)

for carotid body tumors, 492–493, 495f

in cranioplasty, 1233

for glomus tumors, 976

Magnetic resonance imaging (MRI)

for acoustic neuroma, 960

for branchial cleft cyst, 1418

for buccal carcinoma, 220

in central compartment neck dissection, 459

for cerebrospinal fluid leak, 768–769, 769f

for cervical esophagus cancer, 351

for choanal atresia/pyriform aperture stenosis, 1327

for congenital midline nasal masses, 1333

in dacryocystorhinostomy, 1028

for deep lobe tumor, 619

in Draf III procedure, 745

in endonasal approach, to sella and parasellar areas, 775

in endoscopic sphenoidotomy, 730

in EXIT procedure, 1387

in facial translocation approach, 310

in frontal sinus cranialization, 761

in frontal sinus obliteration, 753, 754f

for glomus tumors, 975

for hereditary hemorrhagic telangiectasia, 669

in horizontal partial laryngectomy, 94

for juvenile angiofibroma, 820, 821f

in laryngocele, 40
for lip cancer, 188
in mandibular osteotomy, 1281
in marginal mandibulectomy, 1267–1268
in mastoid surgery, 913
for maxillary sinus, 712, 712f
in maxillary swing/transpalatal/midface degloving with Le Fort I osteotomy approach, 302
in medial maxillectomy, 706
in modified radical neck dissection, 444
in myringoplasty and tympanoplasty, 881
for nasopharyngeal carcinoma, 287–288
in neck surgery, 499
for neural tumors, of parapharyngeal space, 487
in office-based procedures, of salivary glands, 584
in optic nerve decompression, 1033
in orbital decompression, 1039
for oropharyngeal malignancy, 238
in ossicular chain reconstruction, 892
in otosclerosis, 902
in parathyroidectomy, 573
in partial pharyngectomy, 336
in pediatric cochlear implantation, 1450
in pericranial scalp flap, 1165
in petrous apex cholesterol granuloma, 983–984, 985f
in pharyngectomy, 280
of ranula, 597
in rhinectomy, 675

in scalp reconstruction, 1149
for skin cancer of head and neck, 1114
in skull base reconstruction, 832–833, 832f
in soft palate surgery, 262
in stereotactic radiosurgery, 1023
in submandibular gland excision, 608
in superficial parotidectomy, 613
in supracricoid partial laryngectomy, 108
in supraglottic transoral robotic surgery, 114
in surgery of the anterior cranial base, 782
in temporal bone resection, 967
of temporal bones, 995, 995f
in temporoparietal fascial flap, 1171
for thyroglossal duct cyst, 1410
in thyroid surgery, 555
in tongue cancer, 196
in total laryngopharyngectomy, 124
in transcervical pharyngotomy, 271
in transnasal/transoral surgery, 826, 826f
in transoral and robotic tonsil surgery, 250
in transoral CO_2 laser microsurgery, 84
in transoral laser microsurgery, 244
in transoral robotic surgery, 256–257
for traumatic soft tissue and vascular injuries, to neck, 505
"Magnetitis," 1455
Malignant melanoma, 424
Malleus
anomalies of, 1442

problems with, ossicular chain reconstruction for, 893–894, 894f
Malleus-incus complex (MIC), fused, in congenital aural atresia, 1477, 1477f
Mandibular body fractures, 1296
Mandibular buccal vestibule, 402
Mandibular defects, microvascular reconstruction for, 1125–1126, 1126f–1128f
Mandibular distraction, 1423–1428.e1
alternative management plan for, 1427
anesthesia for, 1425
common errors in technique for, 1426
complications of, 1426–1427
contraindications to, 1424
cost effectivity of, 1427
history of, 1423
imaging for, 1424, 1424f
indications for, 1424
instruments and equipment for, 1425
key anatomic landmarks for, 1425
operative period in, 1425–1426
operative risks of, 1425
perioperative antibiotic prophylaxis for, 1425
physical examination for, 1423–1424
positioning for, 1425
postoperative management of, 1426
postoperative period in, 1426–1427
preoperative period in, 1423–1425
preoperative preparation for, 1425, 1425f

prerequisite skills for, 1425
surgical technique of, 1425–1426, 1426f
Mandibular distraction osteogenesis (MDO), 1423
Mandibular fracture, 1292–1298.e1, 1292f–1293f
after floor-of-mouth resection, 217
alternative management plans for, 1298
anesthesia for, 1295
common errors in technique for, 1298
complications of, 1298
contraindications to, 1295
history of, 1294
imaging for, 1295
indications for, 1295
instruments and equipment for, 1295–1296
key anatomic landmarks for, 1296
monitoring for, 1295
occlusion of, 1295
operative period in, 1295–1298
perioperative antibiotic prophylaxis for, 1295
physical examination for, 1294–1295
positioning for, 1295
postoperative period in, 1298
preoperative period in, 1294–1295
preoperative preparation for, 1295
prerequisite skills for, 1296
surgical technique of, 1296–1297
Mandibular invasion, 1273
Mandibular nonunion, after floor-of-mouth resection, 217

Mandibular occlusion, 1305
Mandibular repositioning devices (MRDs), for obstructive sleep apnea, 371
Mandibulectomy
marginal, 1267–1272.e1
anesthesia for, 1268
common errors in technique for, 1270
complications of, 1271
contraindications to, 1268
history of, 1267
imaging for, 1267–1268
indications for, 1268
instruments and equipment for, 1269
Kaplan-Meier estimate of survival by, 1271, 1272f
key anatomic landmarks for, 1269
operative period in, 1268–1270
operative risks of, 1269
perioperative antibiotic prophylaxis for, 1269
physical examination for, 1267, 1268f
positioning for, 1269
postoperative management of, 1270–1271
postoperative period in, 1270–1271
preoperative period in, 1267–1268
preoperative preparation for, 1268
prerequisite skills for, 1269
surgical technique of, 1269–1270, 1269f–1271f
for tongue, 201
segmental, 1273–1279.e1, 1273t

alternative management plan for, 1279
anesthesia for, 1275–1279
common errors in technique for, 1278–1279
complications of, 1279
contraindications to, 1274
definitions of, 1273t
history of, 1273
imaging for, 1274, 1274f
indications for, 1274
instruments and equipment for, 1275
key anatomic landmarks for, 1275, 1276f–1278f
monitoring for, 1275
operative period in, 1275–1279
operative risks of, 1276
perioperative antibiotic prophylaxis for, 1275
physical examination for, 1273
positioning for, 1275
postoperative management of, 1279
postoperative period in, 1279
preoperative period in, 1273–1275
preoperative preparation for, 1275
prerequisite skills for, 1276
surgical technique of, 1276–1278
Mandibulotomy, 1280
of floor-of-mouth resection, 216
Manubrium, absence of, 1442, 1445f
Marginal mandibular nerve
radical neck dissection and, 452, 453f

injury to, 455
superselective neck dissection and, 432
Marginal mandibulectomy (MM), 1267–1272.e1, 1273t
anesthesia for, 1268
common errors in technique for, 1270
complications of, 1271
contraindications to, 1268
of floor-of-mouth resection, 216
history of, 1267
imaging for, 1267–1268
indications for, 1268
instruments and equipment for, 1269
Kaplan-Meier estimate of survival by, 1271, 1272f
key anatomic landmarks for, 1269
operative period in, 1268–1270
operative risks of, 1269
perioperative antibiotic prophylaxis for, 1269
physical examination for, 1267, 1268f
positioning for, 1269
postoperative management of, 1270–1271
postoperative period in, 1270–1271
preoperative period in, 1267–1268
preoperative preparation for, 1268
prerequisite skills for, 1269
surgical technique of, 1269–1270, 1269f–1271f
for tongue, 201
Marsupialization, for ranula, 599
Masseter muscle, Botox cosmetic treatment of, 1105

Masseteric-facial nerve transposition, 1263
Massive and substernal goiter, operative otolaryngology for, 548–553.e1, 549f
alternative management plan for, 553
anesthesia for, 550
classification of, 550t
common errors in technique for, 552
complications of, 552–553
contraindications to, 550
history of, 548–549
imaging for, 550
indications for, 550
instruments and equipment for, 549f, 551
key anatomic landmarks for, 551, 551f
monitoring for, 550
operative period in, 550–552
operative risks of, 551
perioperative antibiotic prophylaxis for, 550
physical examination for, 549–550
positioning for, 550
postoperative management of, 552
postoperative period in, 552–553
preoperative period in, 548–550
preoperative preparation for, 550
prerequisite skills for, 551
surgical technique of, 551–552, 552f
Massive hemoptysis, bronchoscopy for, 135
Masticator space, of buccal carcinoma, 221–222, 222f, 222t

Mastoid surgery, 912–918.e1
alternative management plan for, 917
anesthesia for, 913
audiometry for, 913
common errors in technique for, 917
complications of, 917
contraindications to, 913
history of, 912
imaging for, 913
indications for, 913
instruments and equipment for, 914
key anatomic landmarks for, 914
monitoring for, 914
operative period in, 913–917
operative risks of, 914
perioperative antibiotic prophylaxis for, 914
physical examination for, 912
positioning for, 913–914
postoperative management of, 917
postoperative period in, 917
preoperative period in, 912–913
prerequisite skills for, 914
surgical technique of, 914–917, 915f–916f
Mastoidectomy, 890
instruments and equipment for, 1451
in pediatric cochlear implantation, 1452
Maxilla, 407
Maxillary antrostomy, 656, 657f

Maxillary approaches, in cranio-orbital and midfacial skeleton fractures, 1300
Maxillary artery
internal, 698
internal, in complete maxillectomy, 714
Maxillary balloon dilation, balloon sinus dilation and, 683
Maxillary molar tooth, extraction of, oroantralfi stula after, 700
Maxillary sinus, 688
accessory ostia of, 691
natural ostium of, 686
obstruction of, oroantralfi stula with, 703–704, 704f
tumor of
imaging for, 711–712, 712f
primary treatment of, 711
staging of, 711
Maxillary swing approach, Le Fort I osteotomy via, 304f
Maxillary swing/transpalatal/midface degloving, with Le Fort I osteotomy approach, for nasopharyngectomy, 301–307.e1
alternative management plan for, 306
anesthesia for, 302
common errors in technique for, 305–306
complications of, 306
contraindications to, 302
history of, 301–302
imaging for, 302
indications for, 302
instruments and equipment for, 303
monitoring for, 303

operative period in, 302–306
operative risks of, 303
perioperative antibiotic prophylaxis for, 302–303
physical examination for, 302
positioning for, 302
postoperative period in, 306
preoperative period in, 301–302
preoperative preparation for, 302
prerequisite skills for, 303
surgical anatomy in, 303
surgical technique of, 303–305
Maxillectomy, medial, 705–710.e1
alternative management plan for, 710
anesthesia for, 707
complications of, 710
contraindications to, 706
history of, 705–707
imaging for, 706, 706f
indications for, 706
instruments and equipment for, 707
key anatomic landmarks for, 707
monitoring for, 707
operative risks of, 707
physical examination for, 705–706, 705f
preoperative preparation for, 707
prerequisite skills for, 707
surgical technique of, 708
Maxillofacial computer tomography

with contrast, in endonasal approach, to sella and parasellar areas, 775
in endoscopic ethmoidectomy, 718–719
for genioglossus advancement, 402
Maxillomandibular advancement, for obstructive sleep apnea, 407–412.e1
anesthesia for, 408
antibiotic prophylaxis for, 408–409
arch bar placement for, 409
bilateral sagittal split osteotomy for, 410
closure for, 410
common errors in technique for, 410–411
complications of, 410, 410f
contraindications to, 408
history of, 407
imaging for, 408
indications for, 408
instruments and equipment for, 409
key anatomic landmarks for, 409
Le Fort I osteotomy for, 409–410
monitoring for, 409
operative period in, 408–410
operative risks of, 409
physical examination for, 407–408
positioning for, 408
preoperative period in, 407–408
preoperative preparation for, 408, 408f
prerequisite skills for, 409
surgical technique of, 409–410, 409f
Maxum Hearing Implant System, 935, 935f

alternative management plan for, 937
anesthesia for, 936
audiogram in, 935
common errors in technique for, 936
complications of, 937
contraindications to, 935
history of, 935
imaging for, 935
indications for, 935
instruments and equipment for, 936
key anatomic landmarks for, 936
monitoring for, 936
operative period in, 936
perioperative antibiotic prophylaxis for, 936
physical examination for, 935
positioning for, 936
postoperative management of, 937
postoperative period in, 937
preoperative period in, 935
preoperative preparation for, 935
prerequisite skills for, 936
surgical technique of, 936, 936f
Meatoplasty, in mastoid surgery, 916–917
Medial antebrachial cutaneous nerve graft, 1243
complications after, 1246
positioning for, 1243
technique for, 1243, 1243f
Medial arytenoidectomy, for bilateral vocal fold immobility, 56

with transverse cordotomy, 56
Medial chin rhytids, Botox cosmetic treatment of, 1104
Medial maxillectomy, 705–710.e1
Medial orbit, surgical technique of, 1048
Medial pterygoid plate, anatomy of, 295
Medialization laryngoplasty, 27–32.e1
alternative management plan for, 31
anesthesia for, 28
arytenoid adduction with, 29–30, 30f
common errors in technique for, 30
complications of, 31
contraindications to, 27
history of, 27
imaging for, 27
indications for, 27
instruments and equipment for, 28
intraoperative, 33–38.e1
key anatomic landmarks for, 28
monitoring for, 28
operative period in, 28
operative risks of, 28
physical examination for, 27
positioning for, 28
postoperative management of, 30–31
postoperative period in, 30–31
preoperative period in, 27–28
preoperative preparation for, 27–28
surgical technique, 28–29, 29f

Median mandibulotomy, 1280
Mediastinitis, in penetrating trauma, 333
Medications
advanced palatal surgery and, 378, 382
in volumetric tongue-base reduction, 384
Medrobotics system, lingual tonsillectomy using, 386–387
Melanin, laser light and, 1095
Melanoma
of head and neck, physical examination for, 1114
determining surgical margins in, 1116–1117, 1116f
malignant, orbital exenteration for, 1054, 1054f
Membranous cord
deeper lesions of, 87, 87f–88f
superficial lesions of, 87
Menick's technique, for nasal lining, 1138, 1141f
Ménière's disease (MD), vertigo in, intratympanic gentamicin for, 843
Meningitis
after endonasal approach, to sella and parasellar areas, 780
after endoscopic management, of cerebrospinal fluid leak, 773
after frontal sinus cranialization, 764
in cerebrospinal fluid, otorrhea and encephalocele, 999
in cochlear implantation, in adults, 941
in otitis media, 874
in vertigo, after surgery, 1013
Mentalis muscle, 402–403
Botox cosmetic treatment of, 1105
Merkel cell carcinoma (MCC), determining surgical margins in, 1117
Metaiodobenzylguanidine (MIBG) scintigraphy, in carotid body tumors,

493
Metastases, distant, pharyngectomy and, 280
Microcystic adnexal carcinoma, determining surgical margins in, 1117
Microdébrider, for recurrent respiratory papillomatosis, 17, 1383
Microdermabrasion, 1101
Microflap technique, 10f–12f, 11
Microlaryngoscopy, vocal fold injection via, 20–26.e1
alternative management plan for, 25
anesthesia for, 22
common errors in technique for, 24
complications of, 24–25
contraindications to, 21
history of, 20–21
imaging for, 21
indications for, 21
instruments and equipment for, 22
key anatomic landmarks for, 22, 23f
operative period in, 22–24
operative risks of, 22
physical examination for, 21
positioning for, 22
postoperative management of, 24
postoperative period in, 24–25
preoperative period in, 20–22
preoperative preparation for, 21–22
surgical technique of, 22–24, 24f
Microretrognathia
mandibular distraction osteogenesis for, 1423

photo-documentation of, 1425, 1425f
Microsurgical resection, for acoustic neuroma, 961
Microtia, 1468–1475.e1
alternative management plan for, 1474
reconstruction for, 1468
anesthesia for, 1470
common errors in technique for, 1473
complications of, 1474
contraindications to, 1469, 1470f
earliest age for, 1475
history of, 1468–1469, 1468f
imaging for, 1469
indications for, 1469, 1470f
instruments and equipment for, 1471, 1471f
key anatomic landmarks for, 1471
operative period in, 1470–1473
perioperative antibiotic prophylaxis for, 1470
physical examination for, 1469
positioning for, 1470
postoperative management of, 1474, 1474f
postoperative period in, 1474
preoperative period in, 1468–1470
preoperative preparation for, 1471
prerequisite skills for, 1471
risks of, 1471
stage I, 1471–1473, 1472f
stage II, 1473
stage III, 1473

stage IV, 1473
Microtrapdoor flap, in surgical treatment of BVFI, 57
Microvascular free flaps, in soft palate reconstruction, 264, 264f
Microvascular free tissue, 1138, 1142f–1143f
Microvascular free tissue transfer, for oral-nasal separation loss, 231–233
Microvascular reconstruction, of head and neck, 1125–1133.e1
anesthesia for, 1130
anterolateral thigh free flap in, 1130–1131
common errors in technique for, 1132
contraindications to, 1129
fibular free flap for, 1131
history of, 1125
imaging for, 1125
indications for, 1125–1129, 1126f–1129f
instruments and equipment for, 1130
jejunal free flap for, 1131–1132
key anatomic landmarks for, 1130
operative period in, 1130–1132
perioperative antibiotic prophylaxis for, 1130
physical examination, 1125
positioning for, 1130
postoperative management of, 1132
preoperative period, 1125–1130
preoperative preparation for, 1130
prerequisite skills for, 1130
radial forearm free flap (RFFF) in, 1130
rectus abdominis free musculocutaneous flap and DIEP flaps, 1131
risks of, 1130

scapular and parascapular fasciocutaneous and osteocutaneous flaps in, 1131
technique for, 1130–1132
Mid facial degloving, for medial maxillectomy, 708
Middle cranial fossa
for cholesterol granulomas, 988, 989f
endoscopic endonasal transpterygoid approaches to, 791–801.e1, 791f
alternative management plan for, 801
anatomic landmarks for, 793
anesthesia for, 793
antral corridor in, 795
common errors in technique for, 799
complications of, 801
contraindications to, 793
general principles for, 794, 794f
history of, 791
imaging for, 791–792, 792f
indications for, 792–793
instruments and equipment for, 793
monitoring for, 793
nasal corridor in, 794–795
nasal preparation for, 794
operative period in, 793–799
operative risks of, 794
perioperative antibiotic prophylaxis for, 793
perioperative period in, 791–793
physical examination for, 791
positioning for, 793

postoperative management of, 799–800
postoperative period in, 799–801
preoperative preparation for, 793
prerequisite skills for, 794
pterygoid process, resection of, 795–799, 798f–800f
pterygopalatine fossa in, 795, 796f–797f
surgical technique of, 794–799
Middle ear, congenital malformation of, 1440–1448.e1
surgical correction for
alternative management plan for, 1446
anesthesia for, 1441
common errors in technique for, 1444–1445
contraindications to, 1440–1441
history of, 1440
imaging for, 1440, 1441f
immediate complications of, 1445–1446
indications for, 1440
instruments and equipment for, 1441
key anatomic landmarks for, 1441
monitoring for, 1441
operative period in, 1441–1445
operative risks of, 1441
physical examination for, 1440
positioning for, 1441
postoperative management of, 1445
postoperative period in, 1445–1446
preoperative period in, 1440–1441
preoperative preparation for, 1441

prerequisite skills for, 1441
surgical technique of, 1441–1444
tympanomeatal flap in, 1442, 1442f
Middle-ear effusion, after facial translocation approach, 315
Middle fossa approach
for acoustic neuroma, 964, 965f
of facial nerve, tumors of, 956, 956f
Middle jugular lymph nodes, 436
Middle meatal antrostomies, 692
middle meatal antrostomy and, 657f
Middle thyroid veins, 529
Middle turbinate, surgical therapy for, 647
complications of, 652
indication for, 648
key anatomic landmarks for, 649–650, 649f
operative risks of, 650
Midface and maxillectomy defects, microvascular reconstruction for, 1126–1129, 1129f
Midfacial degloving operative technique, Le Fort I osteotomy via, 303–304, 307
Midfacial skeleton, fractures of, 1299–1308.e1, 1303f–1304f
alternative management plan for, 1308
common errors in technique for, 1307
complications of, 1308
contraindications to, 1300
history of, 1299
imaging for, 1299
indications for, 1299–1300

instruments and equipment for, 1300
key anatomic landmarks for, 1300, 1301f
monitoring for, 1300
operative period in, 1300–1307
operative risks of, 1301
perioperative antibiotic prophylaxis for, 1300
physical examination for, 1299
positioning for, 1300
postoperative management of, 1307–1308
postoperative period in, 1307–1308
preoperative period in, 1299–1300
preoperative preparation for, 1300
prerequisite skills for, 1301
surgical technique of, 1301–1307
Midline palatal split approach, in robotic-assisted nasopharyngectomy, 295, 296f
Minimally invasive video-assisted thyroidectomy, 535–541.e1, 535t
alternative management plan for, 540
anesthesia for, 537
common errors in technique for, 539
complications of, 539–540
contraindications to, 536–537
history of, 535–536
imaging for, 536
indications for, 536
instruments and equipment for, 538
monitoring for, 538
operative period in, 537–539

perioperative antibiotic prophylaxis for, 537–538
physical examination for, 536
positioning for, 537, 537f
postoperative management of, 539
postoperative period in, 539
preoperative period in, 535–537
preoperative preparation for, 537
prerequisite skills for, 538
surgical technique of, 538–539, 538f–539f
Miniplates, for laryngeal trauma repair, 48, 49f
Mitomycin C, for acquired laryngeal stenosis, 67
Mixed hearing loss, bone-anchored hearing devices in, 920
Modern osteoplastic obliteration, 752
Modified barium swallow (MBS) study
in laryngeal cleft repair and laryngotracheal separation, 1373
for laryngomalacia, 1358
for UES dysfunction, 324
Modified facial translocations, 304, 305f
common errors in technique for, 306
Modified lateral decubitus, in regional pedicle flap, 1200
Modified Pittsburgh Staging System for Primary Cancers of the Temporal Bone, 968t
Modified radical neck dissection, 443–449.e1, 456
alternative management plan for, 448
anesthesia for, 445
common errors in technique for, 448
completing lymphadenectomy in, 447, 447f
complications of, 448

contraindications to, 445
defined, 443
drain management in, 448
dressing for, 448
history of, 443
imaging for, 444, 444f
indications for, 444
instruments and equipment, 445
key anatomic landmarks for, 445–446
level 1, 446
level 2 and 5 dissection superior to cranial nerve XI and, 447
management after, 448
monitoring for, 445
monitoring for delirium tremens in, 448
neurologic examination for, 444
nonlymphatic structures in, superior ligation of, 446–447, 447f
operative period in, 445–448
operative risks of, 446, 446f
perioperative antibiotic prophylaxis for, 445
physical examination for, 443–444
positioning for, 445
postoperative period in, 448
preoperative period in, 443–445
preoperative preparation for, 445
prerequisite skills for, 446
technique for, 446–448
Mohs surgery, for skin cancer of head and neck management, 1121, 1124
Molecular biomarkers, in central compartment neck dissection, 459

Molecular testing, before minimally invasive video-assisted thyroidectomy, 537

Monopolar electrocautery, in tonsillectomy and tonsillotomy, 1351t

Montgomery laryngeal stents, 68f

Moraxella catarrhalis, in adenoid, 1341

Morgagni, sinus of, 43

Mucoceles

after skull base reconstruction, 837

ethmoid, 719

in pericranial scalp flap, 1170

Mucociliary flow, 698

Mucormycosis, rhino-orbital-cerebral, 1055

Mucosal blanching, in snoring procedures, 364

Mucosal grafting, in Draf III procedure, 750

Mucosal incision, for phonomicrosurgery, 11, 11f

Mucosal tumors of palate, benign, approach to, 229

Mucus, from drain, in laryngeal trauma, 50

Mucus membrane stripping, endoscopic middle meatal antrostomy, common errors in technique for, 691

Muir-Torre syndrome, skin cancer of head and neck and, 1112–1113

Multicenter Selective Lymphadenectomy Trial (MSLT-1), 424

Multiple fractures, 1297, 1297f

Mustardé sutures, in otoplasty, 1484

Myoelastic aerodynamic theory of phonation, 6

Myotomy, in tracheoesophageal puncture, 180

Myringoplasty, 873, 882, 882f–883f

alternative management plan for, 888

anesthesia for, 881, 881f

audiogram and, 880–881
common errors in technique for, 888
complications of, 888
contraindications to, 881
history of, 880
imaging for, 881
indications for, 881
instruments and equipment for, 881
monitoring for, 881
operative period in, 881–888
perioperative antibiotic prophylaxis for, 881
physical examination for, 880
positioning for, 881
postoperative management of, 888
preoperative period in, 880–881
preoperative preparation for, 881
prerequisite skills for, 882
risks of, 882
Myringotomy, 867–873.e1
anesthesia for, 869
challenges in, 871
common errors in technique for, 872
complications of, 872–873
contraindications to, 869
imaging for, 868
indications for, 868
insertion of tubes and, office-based, 845–846
instruments and equipment for, 870

key anatomic landmarks for, 870, 870f
perioperative antibiotic prophylaxis for, 869
positioning for, 869
postoperative management of, 872
prerequisite skills for, 870
risks of, 870–871
technique for, 871
tympanocentesis and, 1429–1439.e1
anesthesia for, 1431
common errors in technique for, 1433
contraindications to, 1430–1431
history of, 1429
imaging for, 1430
indications for, 1430
instruments and equipment for, 1431
key anatomic landmarks for, 1431, 1431f
operative period in, 1431–1433
operative risks of, 1431–1433
physical examination for, 1430
positioning for, 1431
postoperative management of, 1434
postoperative period in, 1434
preoperative period in, 1429–1431
preoperative preparation for, 1431
prerequisite skills for, 1431, 1432f
surgical technique of, 1433, 1433f
ventilation tube in, 1434–1436
alternative management plan for, 1435

anesthesia for, 1435
common errors in technique for, 1435
complications of, 1435
history of, 1434
indications for, 1434
instruments and equipment for, 1435
operative period in, 1435
operative risks of, 1435
physical examination for, 1434
postoperative management of, 1435
postoperative period in, 1435
preoperative period in, 1434
in speech and language development, 1436
surgical technique of, 1435

N

N0 neck, 435

Narcotic respiratory suppression, in uvulopalatopharyngoplasty, 375

Nasal air escape, 1459

Nasal bones, congenital midline nasal masses in, 1335

Nasal cavities, examination of

for endoscopic nasopharyngectomy, 288

for maxillary swing/transpalatal/midface degloving with Le Fort I osteotomy approach, 302

in robotic-assisted nasopharyngectomy, 293

Nasal cavity débridement, nasal septum perforation and, 643

Nasal closure, for hereditary hemorrhagic telangiectasia, 672

Nasal decongestion, nasal septum perforation and, 643

Nasal dermoid cyst, 1332

with cutaneous sinus tract, 1336

Nasal dorsum, widening of, in surgery of the anterior cranial base, 782

Nasal endoscopy, 625

in balloon sinus dilation, 681

for choanal atresia/pyriform aperture stenosis, 1326

for cleft palate and velopharyngeal dysfunction, 1460

in Draf III procedure, 745

in endonasal approach, to sella and parasellar areas, 775

in endoscopic ethmoidectomy, 718

for epistaxis, 655

in esophagoscopy and hypopharyngoscopy, 318, 318f

in frontal sinus obliteration, 753

in pericranial scalp flap, 1165

Nasal examination, for congenital midline nasal masses and nasolacrimal

duct cyst, 1332–1333, 1333f
Nasal fracture, 1287–1291.e1, 1287f
alternative management plan for, 1290
anesthesia for, 1289
common errors in technique for, 1290
complications of, 1290
contraindications to, 1288
history of, 1287
imaging for, 1288, 1288f
indications for, 1288

Neurofibromatosis-2 (NF2)
in parapharyngeal space, 485, 487
stereotactic radiosurgery for, 1025
Neurologic examination, for modified radical neck dissection, 444
Neurological deficits, in parapharyngeal space, 487
Neuroma, after nerve graft techniques, 1246
Neuropathy, in laryngeal trauma, 46
Neurorrhaphy, in laryngeal trauma, 46

Neurostimulation, device for, 390
Neurovascular bundle, in frontal sinus obliteration, 755
Nicotine, snoring and, 359
Nodules, vocal, 6
Nonaesthetic scars, after nasal reconstruction, 1148
Nonmelanoma skin cancer, physical examination for, 1114
Nonspecific vocal fold lesion, 7
Nonsurgical browlift, 1104
Nonsurgical rhinoplasty, 1110
Nose
  adjacent structures of, 674
  malignant tumors of, 674
  management of skin cancers in, 1119
  rhinoplasty
    lower third of, 1065–1067
    middle third of, 1064–1065
    "opening" of, 1062–1063, 1063f–1064f
    upper third of, 1063–1064, 1065f–1066f
  traumatic soft tissue and vascular injuries of, management of, 507–508
Numbness, facelift and, 1091
Nutritional intake, poor, in uvulopalatopharyngoplasty, 375

O

"O" suture, 1090, 1092f

Obese patients, positioning for phonomicrosurgery, 8

Obliterative material, infection of, after frontal sinus obliteration, 758

Obstructive sleep apnea (OSA), 377

adenoidectomy in, 1342

alternative treatment strategies for, 388

continuous positive airway pressure for, 371

drug-induced sedated endoscopy and, 366

first line surgical treatment of, 384

genioglossus advancement for, 401

hyoid suspension and, 394

maxillomandibular advancement for, 407–412.e1

anesthesia for, 408

antibiotic prophylaxis for, 408–409

arch bar placement for, 409

bilateral sagittal split osteotomy for, 410

closure for, 410

common errors in technique for, 410–411

complications of, 410, 410f

contraindications to, 408

history of, 407

imaging for, 408

indications for, 408

instruments and equipment for, 409

key anatomic landmarks for, 409

Le Fort I osteotomy for, 409–410

monitoring for, 409

operative period in, 408–410
operative risks of, 409
physical examination for, 407–408
positioning for, 408
preoperative period in, 407–408
preoperative preparation for, 408, 408f
prerequisite skills for, 409
surgical technique of, 409–410, 409f
moderate-severe, 388
nonsurgical interventions for, 371
overnight diagnostic sleep testing for, 371
snoring and, 371
uvulopalatopharyngoplasty for, 371, 375
Obturator reconstruction, maxillectomy with, 716f
Occipital arteries, in scalp reconstruction, 1151
Octreotide
in carotid body tumors, 493
chyle fistula and, 448
Ocular examination, for congenital midline nasal masses and nasolacrimal duct cyst, 1332–1333
Ohngren's line, 712, 713f
Olfactory fossa, of depth, Keros classification of, 719f
Olfactory loss, after surgery of the anterior cranial base, 789
Omega-shaped epiglottis, 1357f
Omohyoid muscle
radical neck dissection and, 453
superselective neck dissection and, 432
Ondansetron, for vocal fold injection, 22

Open arytenoidectomy, for BVFI, 57
Open mouth Townes, for mandibular fracture, 1295
Open rhinoplasty, for congenital midline nasal masses, 1335
Open thyroidectomy, 527–534.e1
alternative management plan for, 533
anesthesia for, 529
common errors in technique for, 532–533, 532f
complications of, 533, 533f
contraindications to, 528–529
fine needle aspiration and, 528
history of, 527
imaging for, 528
indications for, 528
instruments and equipment for, 529
key anatomic landmarks for, 529–530
molecular biomarkers and, 528
monitoring for, 529
operative period in, 529–533
perioperative antibiotic prophylaxis for, 529
physical examination for, 527–528
positioning for, 529
postoperative management of, 533
postoperative period in, 533
preoperative period in, 527–529
preoperative preparation for, 529
prerequisite skills for, 530
surgical technique of, 530–532, 531f–532f
Open tracheostomy, 137–145.e1, 138f

alternative management plan for, 144
anesthesia for, 138
common errors in technique for, 141
complications of
  immediate postoperative, 143–144
  late postoperative, 144
contraindications to, 137
decannulation in, 143
history of, 137
imaging for, 137
indications for, 137
instruments and equipment for, 138
intraoperative complications of, 141
key anatomic landmarks for, 138
monitoring for, 138
operative period in, 138–141
past medical history of, 137
perioperative antibiotic prophylaxis for, 138
physical examination for, 137
positioning for, 138
postoperative complications of, 143–144
postoperative management of, 142–143
postoperative period in, 142–144
preoperative period in, 137–138
preoperative preparation for, 137–138
prerequisite skills for, 138
surgical technique of, 138–139, 139f–141f
  in obese patient, 139, 142f

in pediatric, 139
Ophthalmic artery, in paramedian forehead flaps, 1161
Optic nerve decompression, 1033–1037.e1
alternative management plan for, 1037
anesthesia for, 1035
common errors in technique for, 1036
complications of, 1037
contraindications to, 1033–1034
history of, 1033
imaging for, 1033
indications for, 1033, 1034f
instruments and equipment for, 1035
key anatomic landmarks for, 1035, 1035f
monitoring for, 1035
operative period in, 1035–1036
operative risks of, 1035–1036
perioperative antibiotic prophylaxis for, 1035
physical examination for, 1033
positioning for, 1035
postoperative management of, 1037
postoperative period in, 1037
preoperative period in, 1033–1034
preoperative preparation for, 1034
prerequisite skills for, 1035
surgical technique of, 1036, 1036f
Optic nerve injury
after endonasal approach to sella and parasellar areas, 780
medial maxillectomy and, 707

Optic neuropathy, 1038
Optional maneuvers, for drug-induced sedated endoscopy, 369
Oral cavity
cancer of, 218, 1273
for epistaxis, 655
examination of, 219, 220f
for congenital midline nasal masses, 1333
for maxillary swing/transpalatal/midface degloving with Le Fort I osteotomy approach, 302
in robotic-assisted nasopharyngectomy
examination of, 293
inadvertent injuries to, 299
Oral commissures, Botox cosmetic treatment of, 1104
Oral-nasal separation, loss of, rehabilitation for, 231–233, 232f–234f
Oral squamous cell carcinoma, of tongue, 200
Orbicularis oculi
Botox cosmetic injections of, 1104, 1105f
hypertrophied, Botox cosmetic injections for, 1104
Orbit, 1050
for epistaxis, 655
examination of, for frontal sinus obliteration, 753
malignant tumors of, 1054, 1054f
Orbital abscess, 1044–1049.e1, 1045f
alternative management plan for, 1049
anesthesia for, 1046
common errors in technique for, 1048–1049
complications of, 1049
contraindications to, 1046

history of, 1044
imaging for, 1044, 1045f–1046f
indications for, 1044–1046
instruments and equipment for, 1046
intraconal, 1048
key anatomic landmarks for, 1046, 1047f
monitoring for, 1046
operative period in, 1046–1049
operative risks of, 1047
perioperative antibiotic prophylaxis for, 1046
physical examination for, 1044, 1045f
positioning for, 1046
postoperative management of, 1049
postoperative period in, 1049
preoperative period in, 1044–1046
preoperative preparation for, 1046
prerequisite skills for, 1047
subperiosteal, 725, 1047–1048, 1047f–1048f
surgical technique of, 1047–1048
Orbital approaches, for cranio-orbital and midfacial skeleton fractures, 1300, 1301f
Orbital bones, 1309f
Orbital compartment syndrome, 1050, 1053
Orbital decompression, 1038–1043.e1, 1038f
alternative management plan for, 1043
anesthesia for, 1040
common errors in technique for, 1041–1042
complications of, 1042

contraindications to, 1039
history of, 1039
imaging for, 1039
indications for, 1039
instruments and equipment for, 1040
key anatomic landmarks for, 1040
lateral wall, 1041, 1042f
medial wall, 1040–1041
monitoring for, 1040
operative period in, 1040–1042
operative risks of, 1040
perioperative antibiotic prophylaxis for, 1040
physical examination for, 1039
positioning for, 1040
postoperative management of, 1042
postoperative period in, 1042–1043
preoperative period in, 1039–1040
preoperative preparation for, 1040
prerequisite skills for, 1040
surgical technique of, 1040–1041
Orbital exenteration, 1054–1060.e1
alternative management plan for, 1059
anesthesia for, 1056
common errors in technique for, 1058
complications of, 1058–1059
contraindications to, 1056
history of, 1056
imaging for, 1056

indications for, 1056
instruments and equipment for, 1057
key anatomic landmarks for, 1057
for malignant tumors, 1054, 1054f
operative period in, 1056–1058
operative risks of, 1057
perioperative antibiotic prophylaxis for, 1057
physical examination for, 1056
positioning for, 1056
postoperative management of, 1058
preoperative period in, 1056
preoperative preparation for, 1056, 1056f
surgical technique of, 1057–1058, 1057f
survival and, 1059
total or subtotal, 1055–1056, 1055f
Orbital fractures, 1309–1314.e1, 1288f, 1309f–1310f
alternative management plan for, 1313
anesthesia for, 1311
common errors in technique for, 1313
complications of, 1313
contraindications to, 1311
history of, 1310
imaging for, 1311
indications for, 1311
instruments and equipment for, 1312
key anatomic landmarks for, 1312
monitoring for, 1312
operative period in, 1311–1313

operative risks of, 1312
perioperative antibiotic prophylaxis for, 1311
physical examination for, 1311
positioning for, 1311
postoperative management of, 1313
postoperative period in, 1313
preoperative period in, 1309–1311
preoperative preparation for, 1311
prerequisite skills for, 1312
surgical technique of, 1312, 1312f–1313f
Orbital injury
after Draf III procedure, 750
after endonasal approach, to sella and parasellar areas, 780
after medial maxillectomy, 707
after surgery of the anterior cranial base, 784, 789
in external ethmoidectomy, 726
risk of, in endoscopic middle meatal antrostomy, 689
Orbital reconstruction, after exenteration, 1055f–1056f, 1058
Orbital roof fractures, 1305, 1306f
Oroantral fistulas, 700–704.e1
after Caldwell-Luc operation, 698
after floor-of-mouth resection, 217
surgical management of
anesthesia for, 701
antibiotic prophylaxis for, 701
common errors in technique for, 702–703
complications of, 703
contraindications to, 701

history of, 700
imaging for, 700–701
indications for, 701
instruments and equipment for, 701
key anatomic landmarks for, 701
physical examination for, 700
positioning for, 701
postoperative management of, 703
preoperative preparation for, 701
prerequisite skills for, 701
technique of, 701–702, 702f–704f
Orofacial clefting, sleep apnea and, 1467
Oropharyngeal cancer, 270
Oropharyngeal lateral walls, in drug-induced sedated endoscopy, 367
Oropharyngeal malignancy, transoral excision of, 237–242.e1
alternative management plan for, 241
anesthesia for, 239
common errors in technique for, 240
complications of, 240–241
contraindications to, 238, 238f
history of, 237
imaging for, 238
indications for, 238, 238f
instruments and equipment for, 239
key anatomic landmarks for, 239, 239f
monitoring for, 239
operative risks of, 239
perioperative antibiotic prophylaxis for, 239

physical examination for, 237–238
positioning for, 239
postoperative management of, 240
preoperative preparation for, 238–239
prerequisite skills for, 239
surgical technique of, 239–240, 239f–241f
Oropharyngeal trauma, after transoral CO_2 laser microsurgery, 90
Oropharynx, 237
examination of, for neck surgery, 499
Orotracheal intubation, for submandibular gland excision, 609
Orthognathic surgery, for obstructive sleep apnea, 410–411
Osseointegrated implants, 1315–1324.e1
alternative management plan for, 1323
anesthesia for, 1318
common errors in technique for, 1322
complications of, 1323
contraindications to, 1318
history of, 1315–1317
imaging for, 1318
indications for, 1318
instruments and equipment for, 1319, 1319f
key anatomic landmarks for, 1319–1320, 1319f–1320f
monitoring for, 1318–1319
operative period in, 1318–1322
operative risks of, 1322
perioperative antibiotic prophylaxis for, 1318
positioning for, 1318
postoperative management of, 1322–1323

preoperative period in, 1315–1318, 1316f–1317f
preoperative preparation for, 1318
prerequisite skills for, 1320
surgical technique of, 1320–1322, 1321f–1322f
Osseointegration, failure of, in hearing devices, bone-anchored, 925
Ossicular chain injury, in mastoid surgery, 914
Ossicular chain reconstruction, 890–900.e1
alternative management plan for, 899
anesthesia for, 892
common errors in technique for, 899
complications of, 899
conductive hearing loss and, 890
contraindications to, 892
history of, 891
imaging for, 892
indications for, 890
instruments and equipment for, 893
key anatomic landmarks for, 893
monitoring for, 893
operative period in, 892–899
perioperative antibiotic prophylaxis for, 893
physical examination for, 891–892
positioning for, 893
postoperative management of, 899
preoperative preparation for, 892
prerequisite skills for, 893
risks of, 893
technique for, 893–899

for problems with the footplate, 896, 900f
for problems with the incus, 894–896, 895f–898f
for problems with the malleus, 893–894, 894f
for problems with the stapes, 896, 898f
for tympanomeatal flap, 893f
tympanoplasty and, 890
Ossicular dislocation, from otosclerosis, 909
Osteocutaneous flaps, for microvascular reconstruction, 1131
Osteomas, of external auditory canal, 852–859.e1, 853f
surgical management of
alternative management plans for, 858
anesthesia for, 854
complications of, 858
contraindications to, 854
history of, 852–853
imaging for, 853
indications for, 853–854
instruments and equipment for, 855
key anatomic landmarks for, 855
monitoring for, 855
perioperative antibiotic prophylaxis for, 855
physical examination for, 853
positioning for, 854–855
postoperative management of, 858
preoperative preparation for, 854
prerequisite skills for, 855
risks of, 855
technique for, 855–856, 855f–857f

Osteomyelitis, after facial translocation approach, 315
Osteoplastic flap, in frontal sinus obliteration, 755–757, 755f–756f
Osteoplastic flap with obliteration, Draf III procedure and, 750
Osteoradionecrosis (ORN), 1280
after robotic-assisted nasopharyngectomy, 299
of nasopharynx, endoscopic nasopharyngectomy and, 291
in segmental mandibulectomy, 1273
Osteotomies
in complete maxillectomy, 714
mandibular
alternative management plan for, 1285
anesthesia for, 1281
common errors in technique for, 1284–1285
complications of, 1285
contraindications to, 1281
history of, 1280
imaging for, 1281
indications for, 1281
instruments and equipment for, 1282
key anatomic landmarks for, 1282–1283, 1282f
mandibular, 1280–1286.e1
operative period in, 1281–1285
operative risks of, 1283
perioperative antibiotic prophylaxis for, 1282
physical examination for, 1280–1281
positioning for, 1281
postoperative management of, 1285
postoperative period in, 1285

preoperative period in, 1280–1281
preoperative preparation for, 1281
prerequisite skills for, 1283
in rhinoplasty, 1063, 1065f
surgical technique of, 1283–1284, 1284f
for medial maxillectomy, 708, 709f
in segmental mandibulectomy, 1276–1278
Otalgia, myringotomy and, 1430
Otitic hydrocephalus, otitis media and, 878
Otitis externa, malignant, 843, 861
Otitis media, 867
acute, 867
persistent, 867
recurrent, 867
acute, myringotomy for, 1429
after robotic-assisted nasopharyngectomy, 299
alternative management plan for, 873
brain abscess and, 877–878
chronic, with effusion, 867
with effusion, adenoidectomy in, 1342
with effusion, myringotomy for, 1429
eosinophilic, 867
epidural abscess and, 876, 876f
history of, 867
imaging for, 868
intracranial complications of, 874–879.e1, 874f, 875t
history of, 874
imaging for, 875

physical examination for, 875
postoperative care/complications of, 878
surgical technique of, 876
lateral sinus thrombosis and, 876, 877f
meningitis in, 874
operative period in, 869–872
otitic hydrocephalus and, 878
in pediatric population, 1429–1439.e1
petrous apicitis/Gradenigo's syndrome and, 878–879
physical examination for, 867–868, 868f
postoperative management of, 872
preoperative period in, 867–869
subdural abscess (empyema) and, 876–877
testing for, 868
Otology, office-based procedures in, 839–846.e1
Otomicroscopy, for otitis media, 868
Otoplasty, 1482–1486.e1
alternative management plan for, 1486
anesthesia for, 1483
common errors in technique for, 1484
complications of, 1484–1486
contraindications to, 1482
history of, 1482
imaging for, 1482
indications for, 1482
instruments and equipment for, 1483
key anatomic landmarks for, 1483, 1484f
monitoring for, 1483

operative period in, 1483–1484
patients for, 1482, 1483f
perioperative antibiotic prophylaxis for, 1483, 1486
physical examination for, 1482
positioning for, 1483
postoperative management of, 1484
postoperative period in, 1484–1486
preoperative period in, 1482–1483
preoperative preparation for, 1482–1483
prerequisite skills for, 1483
risks of, 1483
surgical technique of, 1483–1484, 1485f
Otorrhea, 994–1000.e1
alternative management plan for, 999
anesthesia for, 996
common errors in technique for, 998
complications of, 998–999
contraindications to, 996
history of, 994–995
imaging for, 995, 995f
indications for, 995–996
instruments and equipment for, 996
key anatomic landmarks for, 996
monitoring for, 996
myringotomy and tube placement and, 872
operative period in, 996–998
operative risks of, 996
perioperative antibiotic prophylaxis for, 996

physical examination for, 995, 995f
positioning for, 996, 997f
postoperative management of, 998
postoperative period in, 998–999
preoperative period in, 994–996
preoperative preparation for, 996
prerequisite skills for, 996
surgical technique of, 996–998
Otosclerosis, 901–911.e1
alternative management plan for, 909
anesthesia for, 902–903
audiometric findings in, 902, 903f
common errors in technique for, 908, 908f
complications of, 908–909, 909f–910f
contraindications to, 902
definition of, 901
epidemiology of, 901
etiology of, 901

preoperative period in, 1164–1165
preoperative preparation for, 1165
prerequisite skills for, 1166
surgical technique of, 1166–1167, 1167f–1169f
Pericranium, in scalp reconstruction, 1151
Perilymph gusher
management of, 1445–1446

middle ear imaging for, 1440

from otosclerosis, 909, 910f

Perineurium, 943, 945f

Periodic fever, aphthous stomatitis, pharyngitis and adenitis (PFAPA), tonsillectomy for, 1349

Perioral lip lines, Botox cosmetic treatment of, 1104

Periorbital injuries

management of, 509, 509f

with possible orbital hematoma, after frontal sinus obliteration, 757–758

Peripheral in-continuity tissue examination, for skin cancer of head and neck management, 1121

Peritonsillar abscesses (PTAs), 515

tonsillectomy for, 1349

Persistent salivary leak, in penetrating trauma, 333

Petrosectomy, translabyrinthine, 878

Petrous apex, 982, 982f

lesions, imaging characteristics of, 984t

Petrous apex cholesterol granuloma drainage, approach to, 982f

Petrous apicitis, otitis media and, 878–879

Pharyngeal cancer, transoral and robotic tonsil surgery for, 249–255.e1

alternative management plan for, 254

anesthesia for, 250

common errors in technique for, 254

complications of, 254

contraindications to, 250

history of, 249

imaging for, 250

indications for, 250

instruments and equipment for, 250–251

monitoring for, 250
perioperative antibiotic prophylaxis for, 250
physical examination for, 249–250
positioning for, 250
postoperative management of, 254
preoperative preparation for, 250
prerequisite skills for, 251
risks of, 251
surgical technique of, 251
tongue base incisions in, 253–254, 253f–254f
transoral technique for, 251–252, 252f–253f
Pharyngeal closure, fistula, during total laryngectomy, 119
Pharyngeal flap
indications for, 1461
superiorly based, 1465–1466, 1465f
Pharyngeal leak, pharyngectomy and, 281, 284
Pharyngeal stenosis, pharyngectomy and, 284
Pharyngeal stricture, after transoral CO_2 laser microsurgery, 90
Pharyngectomy, 279–286.e1
alternative management plan for, 284
anesthesia for, 280
common errors in technique for, 283
complications of, 284
contraindications to, 280
history of, 279
imaging for, 280

indications for, 280
instruments and equipment for, 280
key anatomic landmarks for, 280
management after, 283–284
monitoring for, 280
operative period in, 280–283
partial, 280–281
total laryngectomy and, 282, 282f
perioperative antibiotic prophylaxis and, 280
physical examination for, 279
positioning for, 280
postoperative period in, 283–284
preoperative period in, 279–280
preoperative preparation for, 280
prerequisite skills for, 281
risks of, 281
technique for, 281–283
Pharyngectomy defect, microvascular reconstruction of, 1126, 1129f
Pharyngocutaneous fistula
after arytenoid adduction, 31
after total laryngopharyngectomy, 128
transcervical pharyngotomy and, 277
Pharyngoplasty
dehiscence of, 478
sphincter, 1466–1467, 1466f
Pharyngotomy
lateral, 270–271, 275–276, 276f
posterior pharyngeal wall and, 274–275, 275f

suprahyoid, 270–271
for squamous cell carcinoma of the base of the tongue, 271
technique for, 272–273, 273f–274f
transcervical, 270–278.e1
alternative management plan for, 277
anesthesia for, 272
common errors in technique for, 276
comorbidities and, 271
complications of, 277
contraindications to, 271–272
history of, 270–271
imaging for, 271
indications for, 271
instruments and equipment for, 272
key anatomic landmarks for, 272
management after, 276–277
monitoring for, 272
operative period in, 272–276
operative risks of, 272
palliative care and, 277
perioperative medications for, 272
physical examination for, 271
positioning for, 272
postoperative period in, 276–277
preoperative period in, 270–272
preoperative preparation for, 272
prerequisite skills and, 272
robotic surgery and, 277

technique for, 272–276
Pharynx, examination of, for maxillary swing/transpalatal/midface degloving with Le Fort I osteotomy approach, 302
Phenol, for topical anesthesia to tympanic membrane, 839, 840f
Phonation, myoelastic aerodynamic theory of, 6
Phonomicrosurgery, for benign vocal fold lesions, 6–14.e1
alternative management plan for, 13
anesthesia for, 8
antibiotic prophylaxis for, 9
common errors in technique for, 12–13
complications of, 13
contraindications to, 8
history of, 7–8
indications for, 8
instruments and equipment for, 9
key anatomic landmarks for, 9
microflap technique for, 11
monitoring for, 9
operative period in, 8–13
operative risks of, 9
physical examination for, 8
positioning for, 8, 9f
postoperative management of, 13
postoperative period in, 13
preoperative period in, 7–8
preoperative preparation for, 8
surgical technique of, 9–12
truncation technique for, 11–12, 12f

Photoaging, 1095
Phrenic nerve, radical neck dissection and, 453
injury to, 455
Pierre Robin sequence (PRS), 1423
Pin site infection, after mandibular distraction, 1427
Piriform sinus, carcinoma of, 338f
Pixie ear, facelift and, 1091, 1093f
Plain film radiograph, in transoral removal of elongated styloid process, 266
Platysma muscle
Botox cosmetic treatment of, 1105
superselective neck dissection and, 432
Plication, facelift and, 1089, 1090f
Plummer-Vinson syndrome, 124
"Plunging" ranulas, 596
Pneumatic otoscopy
in ossicular chain reconstruction, 892
for otitis media, 868
Pneumocephalus
after skull base reconstruction, 837
after surgery of the anterior cranial base, 789
in pericranial scalp flap, 1170
in vertigo, after surgery, 1014
Pneumomediastinum, during open tracheostomy, 141
Pneumonia, in tracheal stenosis, 1408
Pneumothorax
after rib graft, 1231
during open tracheostomy, 141, 143f

during tracheostomy, 1391
Polyp
antrochoanal, 686–693.e1, 688f
vocal fold, 7
Polypoid corditis, chronic, 7
Polypoid degeneration, 7
Polysomnography (PSG)
for hyoid suspension, 395
for laryngomalacia, 1358
in tonsillectomy, 1348
Positional therapy, for obstructive sleep apnea, 371
Positive airway pressure (PAP) therapy, advanced palatal surgery and, 377
Positron emission tomography (PET)
in anterior cranial base surgery, 782
for deep lobe tumor, 619
in partial pharyngectomy, 336
for pharyngectomy, 280
in superficial parotidectomy, 613
in supraglottic transoral robotic surgery, 114
for temporal bone resection, 967
in thyroid surgery, 555, 555f
in total laryngopharyngectomy, 124
Positron emission tomography-computed tomography (PET-CT)
for cervical esophagus cancer, 351
in endoscopic nasopharyngectomy, 288
in lip cancer, 188
in maxillary swing/transpalatal/midface degloving with Le Fort I

osteotomy approach, 302
for modified radical neck dissection, 444
in oropharyngeal malignancy, 238
in parathyroidectomy, 573
for radical neck dissection, 451
in robotic-assisted nasopharyngectomy, 294
in supracricoid partial laryngectomy, 108
in total laryngectomy, 118
for transcervical pharyngotomy, 271
in transoral and robotic tonsil surgery, 250
in transoral laser microsurgery, 244
in transoral robotic surgery, 257
Post-auricular approach, for keratitis obturans and canal cholesteatoma, 863, 863f
Postcricoid mucosa, 279
cancer involving, 335
Posterior auricular artery, in scalp reconstruction, 1151
Posterior cricoid split with graft, for subglottic stenosis, 1365–1366
Posterior ethmoid artery (PEA), ligation of, 665
Posterior glottic stenosis (PGS)
after endoscopic repair of laryngeal cleft, 1376
surgical technique of, 73, 74f–75f
treatment of, 61
Posterior neck incision, for facelift, 1088
Posterior scar-microtrapdoor flap, in surgical treatment of BVFI, 57
Posterior triangle lymph nodes, 436
Posterior wall, injury to, after percutaneous tracheostomy, 151
Postextubation narcotic withdrawal, in tracheal stenosis, 1408

Postoperative alopecia, after frontal sinus cranialization, 764

Postoperative epistaxis, after endoscopic management of cerebrospinal fluid leak, 773

Postoperative hemorrhage, in open tracheostomy, 143–144

Poststyloid parapharyngeal space, 485, 486f

tumors in, 485, 486f

surgical approaches to, 489

transcervical approach to, 489, 489f

transparotid approach to, 489, 490f

Posttonsillectomy hemorrhage, in tonsillectomy, 1353–1354

Posttragal incision, for facelift, 1088

Potassium titanyl-phosphate (KTP) laser, for recurrent respiratory papillomatosis, 15, 17, 18f

Prefabricated stent, 68f

Premolar teeth, numbness of, after Caldwell-Luc operation, 698

Prenasal space, congenital midline nasal masses in, 1334, 1335f

Preseptal dissection, for blepharoplasty, 1072

Prestyloid parapharyngeal space, 485, 486f

tumors in, 485, 486f

combined transcervical submandibular and transparotid approaches to, 489

excision of, 469–475.e1

surgical approaches to, 488

transcervical submandibular approach to, 488–489, 489f

transoral approach to, 489

Prevertebral fascia

anatomy of, 295

evaluation of, 353

extension of cancer to, pharyngectomy and, 280

Primary hyperparathyroidism (PHPT), 565
parathyroidectomy for, 565–570.e1
alternative management plan for, 570
anesthesia for, 567
common errors in technique for, 569
complications of, 569–570
history of, 565
imaging for, 565–566, 566f
instruments and equipment for, 567
invasive localization in, 566
key anatomic landmarks for, 567
laboratory in, 565
monitoring for, 567
operative period in, 567–569
operative risks of, 568
perioperative antibiotic prophylaxis for, 567
physical examination for, 565
positioning for, 567
postoperative management of, 569
postoperative period in, 569–570
preoperative period in, 565–567
prerequisite skills for, 568
surgical technique of, 568–569, 568f
Primary snoring, 359
Primary tracheoesophageal puncture, 177, 177f–178f
Procerus muscle
Botox cosmetic injections of, 1104
overactive, Botox cosmetic treatment, 1104

Profound hearing loss, in temporal bone trauma, 1004
Prolonged dysphagia, after supraglottic transoral robotic surgery, 116
Prolonged skull base crusting, in pericranial scalp flap, 1170
Prominent ears, otoplasty for, 1482
Propofol, for drug-induced sedated endoscopy, 367
Proptosis, lateral canthotomy and, 1051
Prosthesis
  in middle ear reconstruction, 1441, 1446
  ossicular replacement prosthesis, 892f
    partial, 890, 895
    total, 890
Prosthetic auricle, 1474
"Pseudo-proptosis," 1069
"Pseudo-ptosis," 1076
PSG, *See* Polysomnography.
Pterygoid canal, juvenile angiofibroma and, 822
Ptosis, eyelid, blepharoplasty and, 1069, 1076
Pulmonary disease, transcervical pharyngotomy and, 271
Pulmonary edema
  after adenoidectomy, 1345
  after tonsillectomy, 1354
Pulmonary function testing
  in tracheal resection, 158
  for tracheal stenosis, 1402, 1404f
Pulse generator placement, in hypoglossal nerve stimulation, 391–392, 392f
Pyriform aperture stenosis (PAS), surgical mangement of, 1325–1331.e1
  alternative management plan for, 1331

anesthesia for, 1327
common errors in technique for, 1330
complications of, 1331
contraindications to, 1327
history of, 1326
imaging for, 1326–1327, 1326f
indications for, 1327
instruments and equipment for, 1327
key anatomic landmarks for, 1327
monitoring for, 1327
operative period in, 1327–1330
operative risks of, 1327
perioperative antibiotic prophylaxis for, 1327
physical examination for, 1326
positioning for, 1327
postoperative management of, 1331
postoperative period in, 1331
preoperative period in, 1325–1327
preoperative preparation for, 1327
prerequisite skills for, 1327
technique of, 1327–1330, 1328f–1330f
Pyriform sinuses, 342f
pharyngectomy and, 280, 281f

R

Radial forearm free flap (RFFF)
for cervical esophagus cancer, 356
in microvascular reconstruction, 1130
for total laryngopharyngectomy, 127t
Radiation therapy (RT)
acquired laryngeal stenosis from, 62
for lip cancer, 195
for melanoma, 1116
for nasopharyngeal carcinoma, 287
for pharyngectomy, 284
in conjunction with chemotherapy, 284
for ranula, 600
for skin cancer of head and neck, 1123
Radical mastoidectomy, in mastoid surgery, 916
Radical neck dissection, 450–457.e1, 451f
alternative management plan for, 456
anesthesia for, 452
common errors in technique for, 455
complications of, 455–456
contraindications to, 452
history of, 450
imaging for, 451
indications for, 451, 451f
instruments and equipment for, 452
key anatomic landmarks for, 452–453
management after, 455
modified, 443–449.e1, 456

alternative management plan for, 448
anesthesia for, 445
common errors in technique for, 448
completing lymphadenectomy in, 447, 447f
complications of, 448
contraindications to, 445
defined, 443
drain management in, 448
dressing for, 448
history of, 443
imaging for, 444, 444f
indications for, 444
instruments and equipment, 445
key anatomic landmarks for, 445–446
level 1, 446
level 2 and 5 dissection superior to cranial nerve XI and, 447
management after, 448
monitoring for, 445
neurologic examination for, 444
nonlymphatic structures in, superior ligation of, 446–447, 447f
operative period in, 445–448
operative risks of, 446, 446f
perioperative antibiotic prophylaxis for, 445
physical examination for, 443–444
positioning for, 445
postoperative period in, 448
preoperative period in, 443–445
preoperative preparation for, 445

prerequisite skills for, 446
technique for, 446–448
monitoring for, 452
operative period in, 452–455
perioperative antibiotic prophylaxis for, 452
physical examination for, 450–451
positioning for, 452
postoperative period in, 455–456
preoperative period in, 450–452
preoperative preparation for, 452, 452f
prerequisite skills for, 453
risks of, 453
technique for, 453–455, 453f–455f
Radiofrequency ablation, for snoring, 361–362, 362f
Radiography
for airway endoscopy, 1394, 1394f
chest
in bronchoscopy, 131
for penetrating trauma, 330
for tracheal stenosis, 1402
for frontal sinus obliteration, 753–754
of laryngocele, 40
Radiosurgery, stereotactic, 1021–1026.e1, 1022f
alternative management plan for, 1025
anesthesia for, 1023
common errors in technique for, 1024
complications of, 1024–1025
contraindications to, 1022

facial nerve results from, 1025
hearing loss due to, 1025
history of, 1021
imaging for, 1022
indications for, 1022
instruments and equipment for, 1023
key anatomic landmarks for, 1023
monitoring for, 1023
neurofibromatosis 2 and, 1025
operative period in, 1023–1024
operative risks of, 1023
perioperative antibiotic prophylaxis for, 1023
physical examination for, 1021–1022
positioning for, 1023
postoperative management of, 1024
postoperative period in, 1024–1025
preoperative period in, 1021–1023
preoperative preparation for, 1022–1023, 1022f–1023f
prerequisite skills for, 1023
radiation source for, 1023–1024, 1024f
surgical technique of, 1023–1024
tumor control using, 1025
vestibular function and, 1025
Radiotracing, for cerebrospinal fluid leak, 768
Ramus fractures, 1297
Ranula, surgical management of, 596–600.e1
alternative management plan for, 599–600
anesthesia for, 597–598

common errors in technique for, 599
complications of, 599
contraindications to, 597
history of, 596–597
imaging for, 596f–597f, 597
indications for, 597
instruments and equipment for, 598
key anatomic landmarks for, 598
monitoring for, 598
operative period in, 597–599
operative risks of, 598
perioperative antibiotic prophylaxis for, 598
physical examination for, 597
positioning for, 598
postoperative management of, 599
postoperative period in, 599–600
preoperative period in, 596–597
preoperative preparation for, 597
prerequisite skills for, 598
surgical techniques for, 598–599, 599f
Re-approximation, for traumatic soft tissue and vascular injuries, to neck, 506–507, 507f–508f
Reactive lesion, of vocal fold, 7
Reanastomosis, for tracheal stenosis, 1405, 1405f
Reanimation
eyelid, 1247–1254.e1
See also Eyelid reanimation
facial, 1255–1266.e1

preoperative period in, 1061–1062
preoperative preparation for, 1062
surgical technique of, 1062–1067, 1063f–1065f
Rhinorrhea, in orbital decompression, 1042
Rhinotomy, lateral
in complete maxillectomy, 714, 715f
medial maxillectomy through, 708, 708f–709f, 710
Rhytidectomy, for buccal space mass, 605–606
Rib cartilage, growth of, 1475
Rib graft, 1227–1231.e1
alternative management plan for, 1231

anesthesia for, 1227
common errors in technique for, 1230–1231
complications of, 1231
contraindications to, 1227
history of, 1227
imaging for, 1227
indications for, 1227, 1228f–1229f
instruments and equipment for, 1228
key anatomic landmarks for, 1228–1229
monitoring for, 1228
operative period in, 1227
operative risks of, 1229
perioperative antibiotic prophylaxis for, 1228
physical examination for, 1227
positioning for, 1227–1228
postoperative management of, 1231
postoperative period in, 1231
preoperative period in, 1227
preoperative preparation for, 1227
prerequisite skills for, 1229
surgical technique of, 1229–1230, 1230f
Rib harvest, in microtia reconstruction, 1471–1472
Rigid bronchoscopy, 131, 132f, 1393
indications for, 1394
instruments and equipment for, 1395, 1395f
surgical technique of, 1396, 1396f–1397f
Rigid esophagoscopy, 320
indications for, 319

instruments and equipment for, 320, 320f
key anatomic landmarks for, 320
operative risks of, 320
prerequisite skills for, 320
surgical technique of, 320, 320f–321f
Rigid tracheoscopy, 1393
indications for, 1394
surgical technique of, 1396
Robotic applications, for neck surgery, 498–503.e1
Robotic approach, of submandibular gland excision, 611
Robotic-assisted nasopharyngectomy, 293–300.e1
anesthesia for, 294
common errors in technique for, 299
complications of, 299
contraindications to, 294
history of, 293
imaging studies in, 294
indications for, 294
instruments for, 294
key anatomic landmarks for, 294–295, 295f
monitoring for, 294
operative period in, 294–299
operative risks of, 298–299
perioperative antibiotics prophylaxis in, 294
physical examination for, 293
positioning for, 294
postoperative care for, 299
postoperative period in, 299–300

preoperative period in, 293–294
preoperative preparation for, 294
prerequisite skills for, 295
surgical technique of, 295–298, 296f–298f
Robotic-assisted thyroidectomy, 542–547.e1
alternative management plan for, 546
anesthesia for, 543
common errors in technique for, 546
complications of, 546
contraindications to, 543
history of, 542
indications for, 542
instruments and equipment for, 543
key anatomic landmarks for, 544
operative period in, 543–546
operative risks of, 544
perioperative antibiotic prophylaxis for, 543
physical examination for, 542
position for, 543, 543f
postoperative management of, 546
postoperative period in, 546
preoperative period in, 542–543
preoperative preparation for, 543, 543t
prerequisite skills for, 544
surgical technique of, 544–546, 544f–546f
Robotic retroauricular approach, in neck surgery, 500–501, 501f–502f
Robotic surgery, transcervical pharyngotomy and, 277
Robotic transaxillary neck dissection, in neck surgery, 501–502, 502f

Rotation flap, inferior and laterally based, for skin cancer of head and neck management, 1118

Round window

anomalies of, 1444

preparation of, in pediatric cochlear implantation, 1452, 1453f

Routine tissue processing, for skin cancer of head and neck management, 1121

Rubin osteotome, in rhinoplasty, 1063, 1065f

Ruptured pexy sutures, as complication of supraglottic laryngectomy, 98

S

S lift, 1090, 1092f

Saccule, 43

Saddle nose deformity, after Draf III procedure, 750

Salicylic acid peels, 1098

Saliva, from drain, in laryngeal trauma, 50

Salivary duct injury, management of, 509

Salivary endoscopy, 592–595.e1

- alternative management plan for, 595

prerequisite skills for, 593
surgical technique of, 593–594, 594f
Salivary fistula, 277
modified radical neck dissection and, 448
in thyroglossal duct cyst, 1412
Salivary gland disease, fine-needle aspiration biopsy for, 413
Salivary glands, office-based procedures for, 583–591.e1
anesthesia for, 585
common errors in technique for, 590
contraindications to, 585
history of, 583
imaging for, 583–584, 584f
indications for, 584–585
instruments and equipment for, 585–586, 586f
key anatomic landmarks for, 586
monitoring for, 585
operative period in, 585–590
operative risks of, 586–587
perioperative antibiotic prophylaxis for, 585
physical examination for, 583
positioning for, 585
postoperative period in, 590–591
preoperative period in, 583–585
preoperative preparation for, 585
prerequisite skills for, 586
sialendoscopy/sialolithotomy as
alternative management plan for, 591
common errors in technique for, 590

complications of, 591
postoperative management of, 590
procedure preparation in, 588, 589f
surgical technique of, 588
surgical technique of, 587
ultrasound-guided fine needle aspiration for
alternative management plan for, 590
common errors in technique for, 590
complications of, 590
longitudinal technique of, 587, 588f
postoperative management of, 590
procedure preparation in, 587
surgical technique of, 587
transverse, 587, 588f
Salivary leak, after retropharyngeal neck dissection, 468
Salvage treatment, for primary nasopharyngeal carcinoma, 293
Sarcoidosis, 628
acquired laryngeal stenosis from, 62, 63f
Sarcoma of the maxilla, maxillectomy for, 1055f
Scalp
in brow lift
examination of, 1078
paraesthesia/numbness of, 1085
evaluation of, for pericranial scalp flap, 1165
management of skin cancers in, 1119–1120
traumatic soft tissue and vascular injuries of, management of, 508–509, 509f
Scalp flap, in frontal sinus cranialization, 762f

Scalp necrosis, after surgery of the anterior cranial base, 789
Scalp paralysis, after frontal sinus obliteration, 758
Scalp reconstruction, tissue expansion and flap reconstruction in, 1149–1158.e1
Scapular flaps, for microvascular reconstruction, 1131
Scarring
  depressed, management of, 165–169.e1, 165f
  facelift and, 1092
  visible, after brow lift, 1085
Schwannomas
  of facial nerve, 952, 952f
  in parapharyngeal space, 485
Schwannomatosis, in parapharyngeal space, 485
Scintigraphy with indium (In-111), for cerebrospinal fluid leak, 768
Sclerotherapy
  for ranula, 599
  for thyroglossal duct cyst, 1414
Sebaceous carcinoma, determining surgical margins in, 1117
Second-degree injury, of facial nerve, 943, 945f
Second primary tongue cancer, 202f
Secondary hyperparathyroidism, 571, 572t
  parathyroidectomy for, 571–578.e1
    alternative management plan for, 577
    anesthesia for, 574
    common errors in technique for, 575
    complications of, 577
    contraindications to, 573
    history of, 571–573, 572t

imaging for, 573, 573f
indications for, 573
instruments and equipment for, 574
key anatomic landmarks for, 574
laboratory in, 573
monitoring for, 574
operative period in, 574–575
operative risks of, 574
perioperative antibiotic prophylaxis for, 574
physical examination for, 573
positioning for, 574
postoperative management of, 575–577
postoperative period in, 575–577
preoperative period in, 571–574
preoperative preparation for, 573–574
prerequisite skills for, 574
surgical technique of, 574–575, 575f–577f
Secondary intention, for scalp reconstruction, 1151–1152, 1152f
Secondary tracheoesophageal puncture
in-office, 179, 180f
in operating room, 177–179, 179f
Sedation, for traumatic soft tissue and vascular injuries, to neck, 505
Segmental mandibulectomy, of floor-of-mouth resection, 216, 217f
Segmental resection, for tracheal stenosis, 1405, 1405f
Seizures
after surgery of the anterior cranial base, 789
in cerebrospinal fluid, otorrhea and encephalocele, 999
of cranioplasty, 1239

Selective neck dissection, 435–442.e1
anesthesia for, 436
clinically negative neck and, pathologic staging of, 441
common errors in technique for, avoidance of, 441
contraindications to, 436
history of, 435
imaging for, 435
indications for, 435
instruments and equipment for, 436
key anatomic landmarks for, 436
level I, 437, 438f
level II-III and II-IV, 437–439, 438f–440f
level V, 439–441, 440f
level VI, 441
management after, 441
monitoring for, 436
in neck surgery, 499
operative period in, 436–441
perioperative antibiotic prophylaxis for, 436
physical examination for, 435
positioning for, 436
postoperative period in, 441
preoperative period in, 435–436
preoperative preparation for, 436
prerequisite skills for, 436
risks for, 437
surgical landmarks for levels of neck in, 436
technique for, 437

Sella and parasellar areas, endonasal approach to, 774–781.e1
alternative management strategies for, 780
anatomic landmarks for, 776, 776f–777f
anesthesia for, 775
common errors in technique for, 779–780
complications of, 780
contraindications to
absolute, 775
relative, 775
editorial comments in, 781
history of, 774
imaging for, 775
indications for, 775
instruments and equipment for, 775
monitoring for, 775
operative period in, 775–780
operative risks of, 776
perioperative antibiotic prophylaxis for, 775
physical examination for, 774–775
positioning for, 775
postoperative management of, 780
postoperative period in, 780
preoperative period in, 774–775
preoperative preparation for, 775
prerequisite skills for, 776
surgical technique of, 776–779, 777f–779f
Semicircular canal, dehiscence of, 1440
Sensorineural hearing loss (SNHL)

in mastoid surgery, 914, 917
in Maxum Hearing Implant System, 937
from otosclerosis, 909
in temporal bone trauma, 1004
Sensory innervation, in scalp reconstruction, 1151
Sentinel lymph node biopsy, 424–429.e1
alternative management plan for, 428
anesthesia for, 425
common errors in technique for, 428
complications of, 428
contraindications to, 425
history of, 424
imaging for, 425
indications for, 425
instruments and equipment for, 425
key anatomic landmarks for, 425–426
for melanoma, 1116
monitoring for, 425
operative period in, 425–428
perioperative antibiotic prophylaxis for, 425
physical examination for, 424–425
positioning for, 425
postoperative period in, 428
preoperative considerations in, 424–425
preoperative preparation for, 425
prerequisite skills for, 426
risk for, 426
technique for, 426–427, 426f–428f

Septal abscess, after nasal septum perforation, 645
Septal buttons, 641–642
Septal deviation, 631
Septal hematoma
after nasal septum perforation, 645
after septoplasty, 638
Septal mucoperichondrial flaps, for nasal reconstruction, 1138
Septal perforation
after endonasal approach, to sella and parasellar areas, 780
after septoplasty, 638
Septodermoplasty, for hereditary hemorrhagic telangiectasia, 671–672
Septoplasty, classic and endoscopic, 631–639.e1
alternative management plan for, 638
anesthesia for, 632
common errors in technique for, 638
complications of, 638
contraindications to, 632
history of, 631
imaging for, 632
indications for, 632
instruments and equipment for, 632
key anatomic landmarks for, 632
monitoring for, 632
operative period in, 632–638
operative risk of, 632
perioperative antibiotic prophylaxis for, 632
physical examination for, 631–632
positioning for, 632

postoperative management of, 638
postoperative period in, 638
preoperative period in, 631–632
preoperative preparation for, 632
prerequisite skills for, 632
surgical technique of
classic, 632–636, 633f–636f
endoscopic, 636–638, 636f–637f
Seroma
after superficial parotidectomy, 616
hyoid suspension and, 397
otoplasty and, 1484
Serum amylase test, for ranula, 597
Serum thyroglobulin, minimally invasive video-assisted thyroidectomy and, 537
Shamblin classification, of carotid body tumors, 492, 493f
Shave excision, in thyroid surgery, 558, 558f
"Shine through" artifact, sentinel lymph node biopsy and, 428
Short-term dysphagia, in volumetric tongue-base reduction, 387
Shortened aryepiglottic folds, 1357f
Shoulder dysfunction, in glomus tumors, 980
Sialadenitis, 607
in office-based procedures, of salivary glands, 584–585
Sialendoscopy
alternative management plan for, 591
common errors in technique for, 590
complications of, 591
postoperative management of, 590

procedure preparation in, 588, 589f
surgical technique of, 588–589
Sialocele
after prestyloid parapharyngeal space tumor excision, 473
after superficial parotidectomy, 616
Sialography
in salivary endoscopy, 592
for submandibular gland excision, 608
Sialolithiasis, in submandibular gland excision, 608
Sialolithotomy
alternative management plan for, 591
common errors in technique for, 590
complications of, 591
postoperative management of, 590
procedure preparation in, 588, 589f
surgical technique of, 589–590
Sialorrhea, chronic, in submandibular gland excision, 608
Sigmoid sinus, injury to, in hearing devices, bone-anchored, 925
Silastic implants, for medialization laryngoplasty, 28
Silastic sheets, insertion of, in nasal septum perforation, 645
Single positron emission CT (SPECT), in marginal mandibulectomy, 1267–1268
Single-stage laryngotracheal reconstruction, for subglottic stenosis, 1367–1368, 1367f–1368f
Sinolith, maxillary, computed tomography of, 695f
Sinonasal disorders, office-based diagnosis of, 625–630.e1, 626f
alternative management plan for, 629
anesthesia for, 626

common errors in technique for, 629
complications of, 629
contraindications to, 626
history of, 625
imaging for, 626
indications for, 626
instruments and equipment for, 626
key anatomic landmarks for, 626–629
monitoring for, 626
operative risks of, 626
perioperative antibiotic prophylaxis for, 626
physical examination for, 625
positioning during, 626
postoperative management of, 629
preoperative preparation for, 626
prerequisite skills for, 626
surgical techniques of, 626–627
Sinonasal packing, in pericranial scalp flap, 1167–1169
Sinonasal tract, tumors of, 783b
Sinus of Morgagni, 43, 289
Sinus thrombosis, lateral, otitis media and, 876, 877f
Sinus tract, branchial anomalies of, 1415
See also Branchial sinuses
Sinusitis
after septoplasty, 638
frontal, 739
Sistrunk procedure, 1409
Skeletal support, for nasal reconstruction, 1138–1141, 1143f–1144f

Skin, in scalp reconstruction, 1151
Skin cancer, of head and neck
histopathology of, 1114–1115
history of, 1112–1114
imaging for, 1114
management of, 1112–1124.e1
alternative plan for, 1123–1124
anesthesia for, 1117
average cost of, by different methods, 1122t
common errors in technique for, 1118–1120
complications of, 1122–1123
considerations for, 1118–1120
contraindications to, 1114
evaluation of surgical margins and pathology interpretation in, 1121–1122
indications for, 1114
instruments and equipment for, 1118
open wounds in, 1120–1121
operative period in, 1117–1122
perioperative antibiotic prophylaxis for, 1118
positioning for, 1118
postoperative, 1122
preoperative preparation for, 1114–1117
risks of, 1122
physical examination for, 1114
Skin closure, for upper eyelid blepharoplasty, 1071, 1071f
Skin excision, for upper eyelid blepharoplasty, 1071, 1071f
Skin flap

for facelift, 1088
loss of, after frontal sinus cranialization, 764
for stomal stenosis revision surgery, 173f
Skin flap necrosis, after nasal reconstruction, 1148
Skin grafting, 1207–1213.e1
alternative management plan for, 1212–1213
anesthesia for, 1208
characteristics of defect, 1207
common errors in technique for, 1211
complications of, 1211–1212
contraindications to, 1208
history of, 1208
imaging for, 1208
indications for, 1208
instruments and equipment for, 1209, 1209f
key anatomic landmarks for, 1209
with local flaps, 1212
monitoring for, 1208
for nasal lining, 1138
operative period in, 1208–1211
perioperative antibiotic prophylaxis for, 1208
physical examination for, 1208
positioning for, 1208
postoperative management of, 1211
postoperative period in, 1211–1213
preoperative period in, 1207–1208
preoperative preparation for, 1208
prerequisite skills for, 1209

for scalp reconstruction, 1152
split-thickness
after complete maxillectomy, 714
for keratitis obturans and canal cholesteatoma, 863
in segmental mandibulectomy, 1276
for tongue resurfacing, 199
surgical technique of, 1209–1211, 1210f–1211f
Skin irritation, after pediatric cochlear implantation, 1455
Skin markings, for upper eyelid blepharoplasty, 1070–1071, 1071f
Skin paddle design, for anterolateral thigh free tissue harvest, 345, 347f
"Skin pinch" technique, for upper eyelid blepharoplasty, 1070–1071
Skin slough, facelift and, 1092
Skin substitutes, of skin grafts, 1212
Skull base defects, microvascular reconstruction for, 1129
Skull base reconstruction, for congenital midline nasal masses, 1335
Skull base surgery, 308, 315
reconstruction after, 831–838.e1
alternative management plan for, 837
anesthesia for, 833
common errors in technique for, 836, 836f
complications of, 837
contraindications to, 833
history of, 831
imaging for, 832–833
indications for, 832f–833f, 833
instruments and equipment for, 834
key anatomic landmarks for, 834, 834f
monitoring for, 834

perioperative antibiotic prophylaxis for, 833
physical examination for, 831
positioning for, 833
postoperative management of, 836–837
preoperative preparation for, 833
prerequisite skills for, 834
risks of, 834
technique of, 834–836, 836f
Sleep, natural, drug-induced sedated endoscopy and, 369
Sleep apnea, orofacial clefting and, 1467
Sleep cine-MRI, in tonsillectomy, 1348
Sleep laboratory testing
before advanced palatal surgery, 378
for snoring, 360
Slide tracheoplasty, for tracheal stenosis, 1405–1406, 1407f
Smoking, facelift and, 1086
"Snap test," 1069
Snap test, for lower eyelid, 1096
Snoreplasty, injection, for snoring, 365, 363–364, 364f
Snoring, 359
contraindications to, 360
history of, 359
imaging/testing for, 360
indications for, 360
office-based procedures for, 359–365.e1, 360–364
alternative management plan for, 364–365
anterior palatoplasty in, 360–361, 361f
complications of, 364

injection snoreplasty in, 365, 363–364, 364f
palatal (pillar) implants in, 362–363, 363f
postprocedure management of, 364
postprocedure period of, 364–365
preprocedure period of, 359–360
radiofrequency ablation in, 361–362, 362f
physical examination for, 360
SOE air cell, of anterior and posterior ethmoid artery ligation, 663
Soft palate
ablation for, 263
cancers of, 261, 262t
defined, 261
length, 379
lymphatic drainage of, 261
neoplasms of, 261, 262f
reconstruction of, 263–264
local flaps in, 263–264, 263f
microvascular free flaps in, 264, 264f
obturation in, 263
primary closure in, 263
regional flaps in, 264
sagittal configuration of, 377, 377f, 379
surgery of, 261–265.e1
alternative management plan for, 264
alternatives to, 262
anesthesia for, 262
common errors in technique for, 264, 264f
complications of, 264

contraindications to, 262
history of, 261
imaging for, 262
indications for, 262
instruments and equipment for, 262
key anatomic landmarks for, 263
management after, 264
monitoring for, 262
operative period in, 262–264
perioperative antibiotic prophylaxis for, 262
physical examination for, 261–262
positioning for, 262
postoperative period in, 264
preoperative period in, 261–262
preoperative preparation for, 262
prerequisite skills for, 263
risks of, 262–263
technique for, 263–264
Soft palate incision, failure to close, in robotic-assisted nasopharyngectomy, 299
Soft surgery techniques, in pediatric cochlear implantation, 1449, 1455–1456
Soft tissue elevation, for anterior and posterior ethmoid artery ligation, 665
Soft tissue reconstruction, 1212
Soft tissue trauma, to neck, management of, 504–512.e1
Solid lesions, of petrous apex, 983
Solid organ transplant, skin cancer of head and neck associated with, 1113

Somatosensory evoked potentials (SSEPs), in Draf III procedure, 745
Sound, 6
Speaking, hypopharyngeal defect reconstruction and, 348
Speech, esophageal, 175
Speech-language pathology (SLP), 175
Sphenoid balloon dilation, balloon sinus dilation and, 683
Sphenoid face, 664
Sphenoid sinus
  in cerebrospinal fluid leak, 770–771, 771f
  paired, 729
Sphenoidotomy, 654
  endoscopic, 729–733.e1, 730f, 733f
    alternative management plan for, 732
    anesthesia for, 731
    common errors in technique for, 732
    complications of, 732
    contraindications to, 730
    endoscopic transethmoid surgical technique of, 732
    endoscopic transnasal surgical technique of, 731–732
    history of, 729–730
    imaging for, 730
    indications for, 730
    instruments and equipment, 731
    key anatomic landmarks for, 731
    monitoring for, 731
    operative period in, 731–732
    operative risks of, 731
    perioperative antibiotic prophylaxis for, 731

physical examination for, 730
positioning for, 731
postoperative management of, 732
postoperative period in, 732
preoperative preparation for, 730
prerequisite skills for, 731
Sphenopalatine artery ligation, for epistaxis, 654–660.e1
alternative management plan for, 659
common errors in technique for, 658
complications of, 659
contraindications to, 655
imaging for, 655
indications for, 655
instruments and equipment for, 656
key anatomic landmarks for, 656, 656f
monitoring for, 656
operative period in, 655–658
operative risks of, 656
physical examination for, 655
positioning for, 656
postoperative management of, 658
postoperative period in, 658–659
preoperative period in, 654–655
preoperative preparation for, 655
prerequisite skills for, 656
surgical technique of, 656–658
Sphenopalatine foramen, 656–657, 657f–658f
Sphincter pharyngoplasty, 1461, 1466–1467, 1466f

Spinal accessory nerve (SAN), 446
injury to
facelift and, 1091
from posterolateral neck dissection, 483
superselective neck dissection and, 432
Spitz nevi, 1117
Split calvarial graft, 1221–1226.e1
alternative management plan for, 1225
anesthesia for, 1222
common errors in technique for, 1224
complications of, 1225
contraindications to, 1221–1222
history of, 1221
imaging for, 1221
indications for, 1221
instruments and equipment for, 1222
key anatomic landmarks for, 1222, 1222f
monitoring for, 1222
operative period in, 1222–1224
operative risks of, 1223
perioperative antibiotic prophylaxis for, 1222
physical examination for, 1221
positioning for, 1222
postoperative management of, 1224
postoperative period in, 1224–1225
preoperative period in, 1221–1222
preoperative preparation for, 1222
prerequisite skills for, 1223

surgical technique of, 1223–1224, 1223f–1224f
Split palate approach, failure to employ, in robotic-assisted nasopharyngectomy, 299
Split-thickness skin grafts (STSGs), 671, 1200, 1207
marginal mandibulectomy and, 1270, 1270f
in orbital exenteration, 1056, 1058
for scapha defects, 1119
Spreader grafts, for rhinoplasty, 1065
Squamous cell carcinoma (SCC), 424
buccal mucosa, 219
in cervical esophagus, 350
cutaneous, determining surgical margins in, 1115, 1115f
of hard palate, 227, 228f
management of neck in, 230
of head and neck (SCCHN), 418
of head and neck of unknown primary origin (SCCHNUP), 418
in hypopharynx, 342
of hypopharynx, 279, 335
of lip, 187
modified radical neck dissection for, 444
orbital exenteration and, 1054
in situ, determining surgical margins in, 1115
of soft palate, 261
primary transoral surgical resection of, 264, 265f
Square jaw, Botox cosmetic treatment of, 1105
Standard maneuvers, for drug-induced sedated endoscopy, 368–369
Stapedectomy with bucket-handle prosthesis, for otosclerosis, 904–908, 905f–908f

Stapedial artery, persistent, 1444, 1448f
Stapedial reflexes, in otosclerosis, 902
Stapedotomy with crimped wire piston prosthesis, for otosclerosis, 908
Stapes
  anomalies of, 1442, 1443f
  problems with, ossicular chain reconstruction for, 896, 898f
  surgery for, 1440
STAR trial, hypoglossal nerve stimulation therapy and, 393
Stenotic meatus, myringotomy and tube placement and, 871
Stensen's duct, 586
  sialendoscopy for, 588–589
Stenting
  for acquired laryngeal stenosis, 67–68, 68f
  in Draf III procedure, 749–750
  for laryngeal trauma repair, 48
  steroid-eluting, 743
  for stomal stenosis, 170
Stereotactic radiosurgery (SRS), 1021–1026.e1, 1022f
  for acoustic neuroma, 961
  alternative management plan for, 1025
  anesthesia for, 1023
  common errors in technique for, 1024
  complications of, 1024–1025
  contraindications to, 1022
  for endoscopic petrosal approaches, to cranial base, 803
  facial nerve results from, 1025
  hearing loss due to, 1025
  history of, 1021

imaging for, 1022
indications for, 1022
instruments and equipment for, 1023
key anatomic landmarks for, 1023
monitoring for, 1023
for neurofibromatosis 2, 1025
operative period in, 1023–1024
operative risks of, 1023
perioperative antibiotic prophylaxis for, 1023
physical examination for, 1021–1022
positioning for, 1023
postoperative management of, 1024
postoperative period in, 1024–1025
preoperative period in, 1021–1023
preoperative preparation for, 1022–1023, 1022f–1023f
prerequisite skills for, 1023
radiation source for, 1023–1024, 1024f
surgical technique of, 1023–1024
tumor control using, 1025
vestibular function and, 1025
Sternocleidomastoid muscle, 446
Sternocleidomastoid myoperiosteal flap, 75–76
Steroids
for acoustic neuroma, 962
perioperative, for recurrent respiratory papillomatosis, 1382
for postprocedure management, of snoring, 364
Stoma, stenosis of, 170
Strangulation, as laryngeal trauma, 45

Strap muscles, repositioning for, for tracheocutaneous fistula and depressed scar, 167f
Streptococcus pneumoniae, in adenoid, 1341
Stridor, laryngomalacia and, 1356
Stroboscopy
microlaryngoscopy and, 21
for vocal fold lesions, 8, 13
Stroke
in cerebrospinal fluid, otorrhea and encephalocele, 999
modified radical neck dissection and, 448
Stylocarotid syndrome, 266
Stylohyoid ligament, 266
Stylohyoid muscle, 396
Styloid process, elongated
Eagle syndrome and, 266
transoral removal of, 266–269.e1
alternative management plan for, 268
anesthesia for, 266–267
complications of, 268
contraindications to, 266
history of, 266
imaging for, 266, 267f
indications for, 266
instruments and equipment for, 267
key anatomic landmarks for, 267
monitoring for, 267
operative period in, 266–267
perioperative antibiotic prophylaxis for, 267

physical examination for, 266
positioning for, 267
preoperative period in, 266
preoperative preparation for, 266
risks of, 267
techniques for, 267, 268f
Subcutaneous emphysema
after laryngeal surgery, 80–81
after open tracheostomy, 144
as complication of supraglottic laryngectomy, 97, 97f
Subcutaneous tissue, in scalp reconstruction, 1151
Subdural abscess (empyema), otitis media and, 876–877
Subdural effusions, after cranioplasty, 1235f, 1239
Subglottic stenosis (SCS), 1362–1371.e1, 61, 1362t
common errors in technique for, 1369
contraindications to, 1363–1364
relative, 1363–1364
history of, 1363
imaging for, 1363
indications for, 1363
operative period in, 1364–1369
anterior cricoid split for, 1364
cartilage harvest for, 1364–1365, 1365f–1366f
cricotracheal resection for, 1368–1369, 1369f–1370f
double-stage laryngotracheal reconstruction for, 1368, 1368f
endoscopic dilation for, 1364
posterior cricoid split with graft for, 1365–1366
single-stage laryngotracheal reconstruction for, 1367–1368, 1367f–

1368f
physical examination for, 1363
preoperative period in, 1363–1364
preoperative preparation for, 1364
surgical technique of, 77f, 73–76, 76f–80f
Subglottis, 60
recurrent respiratory papillomatosis on, 1382
Sublabial drill out procedure, for PAS repair, 1329, 1330f
Sublingual gland, 598
Submandibular approach, transcervical
to poststyloid parapharyngeal space, 489, 489f
to prestyloid tumors, 488–489, 489f
Submandibular gland
direct endoscopic excision of, 500
excision of, 607–612.e1, 607f
alternative management plan for, 611
anesthesia for, 609
common errors in technique for, 611
complications of, 611
contraindications to, 608
endoscopic approach to, 611
history of, 607–608
imaging/diagnostics of, 608
indications for, 608
instruments and equipment for, 609
intraoral approach to, 610–611
key anatomic landmarks for, 609
monitoring for, 609

operative period in, 609–611
operative risks of, 609
perioperative antibiotic prophylaxis for, 609
physical examination for, 608
positioning for, 609
postoperative management of, 611
postoperative period in, 611
preoperative period in, 607–609
preoperative preparation for, 608–609
prerequisite skills for, 609
robotic approach to, 611
surgical technique of, 609–611
transcervical approach to, 609–610, 610f–611f
salivary endoscopy of, 593
Submandibular hilum, 586
Submandibular lymph nodes, 436
Submental island flap, 1195
common errors in technique for, 1196
contraindications to, 1195
indications for, 1195
key anatomic landmarks for, 1196
operative period in, 1196
postoperative period in, 1197–1198
preoperative period in, 1195
surgical technique of, 1196, 1197f
Submental lymph nodes, 436
Submentoplasty, 1090
Submucous cleft palate, in adenoidectomy, 1342

Subperiosteal abscess, 1047–1048, 1047f
Subperiosteal dissection, 1305
Subperiosteal lift fallen, 1093
Subperiosteal pocket, in pediatric cochlear implantation, 1452, 1452f
Subraorbital rim, in frontal sinus obliteration, 755
Substernal goiter, operative otolaryngology for, 548–553.e1, 549f
  alternative management plan for, 553
  anesthesia for, 550
  classification of, 550t
  common errors in technique for, 552
  complications of, 552–553
  contraindications to, 550
  history of, 548–549
  imaging for, 550
  indications for, 550
  instruments and equipment for, 549f, 551
  key anatomic landmarks for, 551, 551f
  monitoring for, 550
  operative period in, 550–552
  operative risks of, 551
  perioperative antibiotic prophylaxis for, 550
  physical examination for, 549–550
  positioning for, 550
  postoperative management of, 552
  postoperative period in, 552–553
  preoperative period in, 548–550
  preoperative preparation for, 550
  prerequisite skills for, 551

surgical technique of, 551–552, 552f
Subtotal temporal bone dissection, for temporal bone, resection of, 971
Superficial injection, vocal fold injection and, 25
Superficial muscle aponeurotic system (SMAS), treatment of, for facelift, 1089, 1090f–1091f
Superficial temporal artery
in paramedian forehead flaps, 1161
in scalp reconstruction, 1151
Superior canal dehiscence syndrome, 1440
Superior laryngeal nerve (SLN)
cervical spine and, 522
open thyroidectomy and, 530
Superior orbit, surgical technique of, 1047–1048, 1047f–1048f
Superior semicircular canal dehiscence, 1015–1020.e1
alternative management plan for, 1020
anesthesia for, 1016
audiometric findings in, 1016, 1016f
common errors in technique for, 1019
complications of, 1019–1020
contraindications to, 1016
history of, 1015
imaging for, 1016, 1017f
indications for, 1016
instruments and equipment for, 1016
key anatomic landmarks for, 1017
medication for, administration of, 1016
monitoring for, 1016
operative period in, 1016–1019

operative risks of, 1017
perioperative antibiotic prophylaxis for, 1016
physical examination for, 1015
positioning for, 1016
postoperative management of, 1019
postoperative period in, 1019–1020
preoperative period in, 1015–1016
preoperative preparation for, 1016
prerequisite skills for, 1017
surgical technique of, 1018–1019, 1018f–1019f
Superior thyroid artery, 529
Superior thyroid veins, 529
Superior trapezius flap, 1200
Superior trapezius musculocutaneous flap, 1200
Superiorly based pharyngeal flap, 1465–1466, 1465f
Superselective neck dissection, 430–434.e1
alternative management plan for, 434
anesthesia for, 431
common errors in technique for, 433
complications of, 434
contraindications to, 431
history of, 430
imaging for, 431
indications for, 431
instruments and equipment for, 432
key anatomic landmarks for, 432
management after, 433–434
monitoring for, 432

operative period in, 431–433
operative risks of, 432
past medical history of, 430
physical examination for, 430–431
positioning for, 431
postoperative period in, 433–434
preoperative antibiotics for, 431–432
preoperative period in, 430–431
preoperative preparation for, 431
prerequisite skills for, 432
techniques for, 432–433, 433f
Supraclavicular flap, 1194
contraindications to, 1194
indications for, 1194
key anatomic landmarks for, 1194
operative period in, 1194–1195
postoperative period in, 1197–1198
preoperative period in, 1194
surgical technique of, 1195, 1195f
Supraclavicular triangle, of supraclavicular flap, 1194
Supracricoid hemilaryngopharyngectomy (SCHLP), 337
Supracricoid laryngectomy, postoperative edema after, 98
Supracricoid partial laryngectomy, 107–112.e1
alternative management plan for, 112
anesthesia for, 108
with CHEP for glottic carcinoma, 109f–111f, 110
common errors in technique for, 111
complications of, 111–112

contraindications to, 108
with cricohyoidopexy for supraglottic carcinoma, 110–111, 111f–112f
history of, 107
imaging for, 108
indications for, 108
instruments and equipment for, 108
key anatomic landmarks for, 108, 109f
long-term outcomes of, 112
monitoring for, 108
operative period in, 108–111
operative risks of, 109
perioperative antibiotic prophylaxis for, 108
physical examination for, 107–108
positioning for, 108
postoperative management of, 111
postoperative period in, 111–112
preoperative period in, 107–108
preoperative preparation for, 108
prerequisite skills for, 109
surgical technique of, 109–110, 109f
Supraglottic cancer
cricohyoidopexy for, supracricoid partial laryngectomy with, 110–111, 111f–112f
supraglottic laryngectomy for, 92
transoral CO_2 laser microsurgery for, 87f, 89, 89f
Supraglottic laryngectomy, TORS, 113
Supraglottic stenosis, surgical technique of, 68–69
Supraglottic transoral robotic surgery, 113–117.e1

alternative management plan for, 117
common errors in technique for, 116
complications of, 116
contraindications to, 114
history of, 113
imaging for, 114
indications for, 114
key anatomic landmarks for, 114
operative period in, 114
physical examination for, 113–114
postoperative care for, 116
preoperative period in, 113–114
preoperative preparation for, 114
prerequisite skills for, 115
surgical technique of, 115–116, 115f–116f
Supraglottis, 60
recurrent respiratory papillomatosis on, 15f, 1382
Supraglottoplasty, 1356
Suprahyoid pharyngotomy, 270
Supraorbital arteries
in paramedian forehead flaps, 1161
in scalp reconstruction, 1151
Supraorbital nerves, in scalp reconstruction, 1151
Suprasellar exposure, in endonasal approach, to sella and parasellar areas, 778, 778f
Supratrochlear arteries
in paramedian forehead flaps, 1161
in scalp reconstruction, 1151

Supratrochlear nerves, in scalp reconstruction, 1151

Sural nerve graft, 1243

complications after, 1246

positioning for, 1243

surgical technique of, 1243–1244, 1244f

Surgeon-performed duplex ultrasound, in scalp reconstruction, 1149

Surgical field, coverage of, in robotic-assisted nasopharyngectomy, 298, 298f

Surgical robot, 293, 295

Surgical site dehiscence, after frontal sinus obliteration, 757

Swallowing

evaluation, in neural tumors, of parapharyngeal space, 487

hypopharyngeal defect reconstruction and, 348

Symphysis/parasymphysis fracture, 1296

Syndrome of inappropriate antidiuretic hormone (SIADH), after surgery of the anterior cranial base, 789

Syndrome of multiple trichoepitheliomas, skin cancer of head and neck and, 1113

Synechiae

after endoscopic middle meatal antrostomy, 691

after inferior turbinate surgery, 652

after middle turbinate surgery, 652

after nasal septum perforation, 645

interarytenoid, lysis of, 55

Systemic disease, cosmetic Botox and fillers, 1102

Systemic infection, after floor-of-mouth resection, 217

T

T2 sequences, for acoustic neuroma, 960
Taste, loss of, in vertigo, after surgery, 1014
Technetium-99m sestamibi scintigraphy
  in parathyroid hormone monitoring, 563
  in parathyroidectomy, 566, 566f, 573
  for sentinel lymph node biopsy, 426
Tegmen, injury to, in mastoid surgery, 914
Temple, management of skin cancers in, 1119–1120
Temporal bone
  dural sinus and, relationship between, 877f
  resection of, 967–973.e1, 969f
    acute postoperative complications of, 972
    alternative management plan for, 973
    anesthesia for, 968
    common errors in technique for, 971–972
    contraindications to, 968
    history of, 967
    imaging for, 967
    indications for, 968, 968t
    instruments and equipment for, 968
    key anatomic landmarks for, 968–970, 969f
    monitoring for, 968
    operative period in, 968–972
    operative risks of, 970
    perioperative antibiotic prophylaxis for, 968
    physical examination for, 967
    positioning for, 968

postoperative period in, 972–973
preoperative period in, 967–968
preoperative preparation for, 968
prerequisite skills for, 970
routine postoperative management of, 972
surgical technique of, 970–971, 970f–971f
Temporal bone fracture classification, 1004, 1005f
Temporal bone trauma, 1001–1006
alternative management plan for, 1004
anesthesia for, 1002
common errors in technique for, 1004
complications of, 1004
decompression surgery for
contraindications to, 1002
indications for, 1002
history of, 1001
imaging for, 1001
instruments and equipment for, 1002
key anatomic landmarks for, 1002
monitoring for, 1002
operative period in, 1002–1004
operative risks of, 1002
perioperative antibiotic prophylaxis for, 1002
physical examination for, 1001
positioning for, 1002
postoperative management of, 1004
postoperative period in, 1004
preoperative period in, 1001–1002

preoperative preparation for, 1002
prerequisite skills for, 1002
surgical technique of, 1002–1004, 1003f
Temporal lobe edema/contusion, in facial nerve decompression, 950
Temporal wasting, after frontal sinus cranialization, 765
Temporalis fascia/muscle, in frontal sinus obliteration, 755
Temporalis muscle, transposition of, 1175–1179.e1
alternative management plan for, 1177
anesthesia for, 1176
common errors in technique for, 1177
complications of, 1177
contraindications to, 1175
history of, 1175
imaging for, 1175
indications for, 1175
instruments and equipment for, 1176
key anatomic landmarks for, 1176
monitoring for, 1176
operative period in, 1176–1177
operative risks of, 1176
perioperative antibiotic prophylaxis for, 1176
physical examination for, 1175
positioning for, 1176
postoperative management of, 1177
postoperative period in, 1177
preoperative period in, 1175–1176
preoperative preparation for, 1175–1176
prerequisite skills for, 1176

surgical technique of, 1176–1177, 1178f
Temporalis muscle flap, in orbital exenteration, 1058
Temporomandibular joint dysfunction, vocal fold injection and, 25
Temporoparietal fascia, 1172
Temporoparietal fascial flap, 1171–1174.e1
anesthesia for, 1171
common errors in technique for, 1172
complications of, 1173
contraindications to, 1171
editorial comment in, 1174
evidence-based question in, 1173–1174
history of, 1171
imaging for, 1171
indications for, 1171
instruments and equipment for, 1171–1172
key anatomic landmarks for, 1172
monitoring for, 1171
operative period in, 1171–1172
operative risks of, 1172
perioperative antibiotic prophylaxis for, 1171
physical examination for, 1171
positioning for, 1171
postoperative management of, 1173
postoperative period in, 1173
preoperative period in, 1171
preoperative preparation for, 1171
prerequisite skills for, 1172
surgical technique of, 1172, 1173f–1174f

Tension pneumocephalus, after Draf III procedure, 750
Tensor fascia lata (TFL), 1220
Tensor veli palatine muscle, 289
Tetracaine, for tympanic membrane anesthesia, 839
Third-degree injury, of facial nerve, 943, 945f
30-degree telescope, failure to use, in robotic-assisted nasopharyngectomy, 299
Three-stage nasal reconstruction, 1138, 1141f
Thrombectomy, lateral sinus thrombosis and, 878
Thyroarytenoid-lateral cricoarytenoid (TA-LCA) muscle, LEMG of, 53
Thyroglobulin (Tg), open thyroidectomy and, 528
Thyroglossal duct cyst, 1409–1414.e1
  alternative management plan for, 1414
  anesthesia for, 1410
  common errors in technique for, 1412
  complications of, 1412–1414
  contraindications to, 1410
  history of, 1410
  imaging for, 1410
  indications for, 1410
  instruments and equipment for, 1410
  key anatomic landmarks for, 1410
  monitoring for, 1410
  operative period in, 1410–1412
  operative risks of, 1411
  perioperative antibiotic prophylaxis for, 1410
  physical examination for, 1410
  positioning for, 1410

postoperative management of, 1412
postoperative period in, 1412–1414
preoperative period in, 1409–1410
preoperative preparation for, 1410
prerequisite skills for, 1411
surgical technique of, 1411, 1412f
modification of, 1411, 1413f–1414f
Thyrohyoid approach, in percutaneous injection technique, 3, 3f
Thyroid cancer, invasive, 554–561.e1
alternative management plan for, 560
anesthesia for, 555
common errors in technique for, 559
complications of, 560
contraindications to, 555
diagnostic studies for, 554–555, 555f
history of, 554
indications for, 555
instruments and equipment for, 556
key anatomic landmarks for, 556–557, 556f–557f
monitoring for, 555–556
operative period in, 555–559
operative risks of, 557
perioperative antibiotic prophylaxis for, 555
physical examination for, 554
positioning for, 555
postoperative management of, 559–560
postoperative period in, 559–560
preoperative period in, 554–555

preoperative preparation for, 555
prerequisite skills for, 557
surgical technique of, 557–559, 557f–559f
Thyroid cartilage, 396
Thyroid disease, fine-needle aspiration biopsy for, 413, 414t
Thyroid dysfunction, after parathyroidectomy, 570
Thyroid function test, in minimally invasive video-assisted thyroidectomy, 537
Thyroid gland, 529
inspection of, 353
palpation of, cancer and, 93
Thyroid lobectomy, 528
in open thyroidectomy, 530–532, 531f–532f
Thyroid nodule, fine-needle aspiration biopsy for, 413
Thyroid scan, in robotic-assisted thyroidectomy, 542
Thyroid stimulating hormone, open thyroidectomy and, 528
Thyroid ultrasound, in robotic-assisted thyroidectomy, 542
Thyroidea ima artery, 529
Thyroidectomy
minimally invasive video-assisted, 535–541.e1, 535t
alternative management plan for, 540
anesthesia for, 537
common errors in technique for, 539
complications of, 539–540
contraindications to, 536–537
history of, 535–536
imaging for, 536
indications for, 536

instruments and equipment for, 538
monitoring for, 538
operative period in, 537–539
perioperative antibiotic prophylaxis for, 537–538
physical examination for, 536
positioning for, 537, 537f
postoperative management of, 539
postoperative period in, 539
preoperative period in, 535–537
preoperative preparation for, 537
prerequisite skills for, 538
surgical technique of, 538–539, 538f–539f
open, 527–534.e1
robotic-assisted, 542–547.e1
alternative management plan for, 546
anesthesia for, 543
common errors in technique for, 546
complications of, 546
contraindications to, 543
history of, 542
indications for, 542
instruments and equipment for, 543
key anatomic landmarks for, 544
operative period in, 543–546
operative risks of, 544
perioperative antibiotic prophylaxis for, 543
physical examination for, 542
position for, 543, 543f

postoperative management of, 546
postoperative period in, 546
preoperative period in, 542–543
preoperative preparation for, 543, 543t
prerequisite skills for, 544
surgical technique of, 544–546, 544f–546f
total, 528
Thyroplasty, type I, *See* Medialization laryngoplasty.
Thyrotomy, lateral, for laryngocele excision, 42, 42f
Tissue expansion, in scalp reconstruction, 1149–1158.e1
common errors in technique for, 1155
complications of, 1156–1157
contraindications to, 1150
editorial comment, 1157
history of, 1149
imaging for, 1149
indications for, 1149–1150
instruments and equipment for, 1151
key anatomic landmarks for, 1151
operative period in, 1151–1155
operative risks of, 1151
physical examination for, 1149, 1150f
postoperative management of, 1155–1156
postoperative period in, 1155–1157
preoperative assessment for, 1149
preoperative period in, 1149–1151
preoperative preparations for, 1151
prerequisite skills for, 1151

revisional reconstructive procedures for, 1157
surgical techniques for, 1151–1155, 1152f–1156f
Tobacco use
as risk factor for cancer, 450
transcervical pharyngotomy and, 271
vocal fold injection and, 21
Tongue, in drug-induced sedated endoscopy, 367
Tongue-base reduction, volumetric, 384–387.e1
alternative management plan for, 387
anesthesia for, 386
common errors in technique for, 387
complications of, 387
contraindications to, 386
history of, 384–385
imaging for, 385, 385f
indications for, 385–386
key anatomic landmarks for, 386
monitoring for, 386
operative period in, 386–387
physical examination for, 385
positioning for, 386
postoperative period in, 387
preoperative period in, 384–386
preoperative preparation for, 386
preparation in, 386
surgical technique of, 386–387
Tongue cancer, 203
neck dissection in, 196

second primary, 202f
total glossectomy for, 202f
Tongue depressor, for anterior palatoplasty, 360
Tongue dysgeusia, vocal fold injection and, 25
Tongue flap, for oroantral fistulas, 702
Tongue-lip adhesion (TLA), mandibular distraction and, 1423, 1427
Tonsillar asymmetry, tonsillectomy for, 1349
Tonsillar pillars, 263
Tonsillectomy, 1347–1355.e2
alternative management plan for, 1354
anesthesia for, 1349
common errors in technique for, 1353
complications of, 1354, 1354t
contraindications to, 1349
history of, 1347
imaging/diagnostics for, 1348
indications for, 1348–1349, 1349t–1350t
instruments and equipment for, 1350, 1351t
key anatomic landmarks for, 1350
operative period in, 1349–1353
operative risks of, 1351
perioperative antibiotic prophylaxis for, 1350
physical examination for, 1347–1348, 1348f
positioning for, 1349–1350, 1350f
postoperative management of, 1353
postoperative period in, 1353–1354
preoperative period in, 1347–1349
preoperative preparation for, 1349

prerequisite skills for, 1350
surgical technique of, 1351–1353, 1351f–1352f
Tonsillotomy, 1351t, 1353
Tonsils, examination of, in tonsillectomy, 1347, 1348f
Tooth (teeth)
extraction of, oroantralfistula after, 700
injury to
in phonomicrosurgery, 9
vocal fold injection and, 25
Tooth apices, after Caldwell-Luc operation, injury to, 698
TORS, *See* Lingual tonsillectomy, Tongue-base reduction, volumetric.
TORS BOT procedure, for SCCHNUP, 423
Torus tubarius, 870
Total arytenoidectomy, for bilateral vocal fold immobility, 56–57, 56f–57f
Total esophagectomy, for cervical esophagus cancer, 353, 354f–355f
Total hearing loss, in vertigo, after surgery, 1013
Total intravenous anesthesia (TIVA)
for endoscopic middle meatal antrostomy, 687
used for endoscopic ethmoidectomy, 720
used for endoscopic sphenoidotomy, 731
Total laryngectomy, 118–123.e1
alternative management plan for, 123
anesthesia for, 119
common errors in technique for, 123
complications of, 123
contraindications to, 119
history of, 118
imaging for, 118

indications for, 118–119
instruments and equipment for, 119
key anatomic landmarks for, 119
monitoring for, 119
operative period in, 119–123
operative risks of, 119
physical examination for, 118
positioning for, 119
postoperative management of, 123
preoperative period in, 118–119
preoperative preparation for, 119
prerequisite skills for, 119
surgical technique of, 119–122, 120f–123f
voice restoration after, 175–181.e1
alternative management plan for, 180
complications of, 180
contraindications to, 176
history of, 176
imaging for, 176
indications for, 176
operative period in, 177–179
physical examination for, 176
postoperative period in, 180
preoperative period in, 175–176
preoperative preparation for, 176
Total laryngopharyngectomy, 124–130.e1, 337–338
alternative management plan for, 128
anesthesia for, 125

common errors in technique for, 126
complications of, 128
contraindications to, 125
history of, 124
imaging for, 124
indications for, 125, 125t
instruments and equipment for, 125
key anatomic landmarks for, 125
operative period in, 125–126
operative risks of, 125
perioperative antibiotic prophylaxis for, 125
physical examination for, 124
positioning during, 125
postoperative management of, 127
postoperative period in, 127–129
preoperative period in, 124
preoperative preparation for, 125
prerequisite skills for, 125
surgical technique of, 125–126, 126f, 127t, 128f
Total laryngopharyngectomy defect, anterolateral thigh free tissue harvest for, 345–346, 346f
Total temporal bone resection, for temporal bone, resection of, 971
Total thyroidectomy, 528, 532
Toxic shock syndrome, after septoplasty, 638
TPA, *See* Transpalatal advancement pharyngoplasty.
Trachea
for airway anastomosis, 161f
division of, 160f

segmental arterial blood supply of, 159f
Tracheal anastomosis, 161f
in tracheal resection, 159–160
Tracheal dehiscence, in tracheal stenosis, 1407
Tracheal re-stenosis, in tracheal resection, 162
Tracheal resection, 157–164.e1
alternative management plan for, 163
anesthetic management for, 158
for cervical esophagus cancer, 353
common errors in technique for, 161–162
complications of, 162–163
contraindications to, 157
imaging for, 157
indications for, 157
instruments and equipment for, 158
monitoring for, 158
operative period in, 158
operative risks of, 158
perioperative antibiotics for, 158
perioperative period in, 157–158
physical examination for, 157
positioning for, 158
postoperative management of, 162
postoperative period in, 162–163
prerequisite skills for, 158
surgical procedure for, 159–161, 159f–161f
Tracheal stenosis, 81
after open tracheostomy, 144

definition of, 170
management of, 1401–1408.e1
alternative management plan for, 1408
anesthesia for, 1404
common errors in technique for, 1406

tracheocutaneous fistula and depressed scar after, 167f
Traction suture
for blepharoplasty, 1072
for thyroglossal duct cyst, 1411, 1413f–1414f
Traditional uvulopalatopharyngoplasty, *See* Uvulopalatopharyngoplasty.
Tragal incision, for facelift, 1088
Transaxillary thyroidectomy, 543f
Transcervical approach
anterior, to cervical spine, 519–526.e1
of submandibular gland excision, 609–610, 610f–611f
Transcervical pharyngotomy, 270–278.e1, 339
Transcervical submandibular approach
to poststyloid parapharyngeal space, 489, 489f
for prestyloid parapharyngeal space tumor excision, 472–473, 472f
to prestyloid tumors, 488–489, 489f
Transcochlear approach, for petrous apex, lesion of, 991, 991f
Transcolumellar incision, in rhinoplasty, 1062, 1063f

Transconjunctival (preseptal) blepharoplasty, lower eyelid, 1072, 1072f–1074f

Transcricothyroid, in percutaneous injection technique, 3, 3f

Transcutaneous (skin-muscle flap) blepharoplasty, lower eyelid, 1072–1076, 1074f–1076f

Transcutaneous bone-anchored hearing devices, 919

Transethmoid approach, to sphenoid sinus, 729

Transethmoidal-pterygo-sphenoidal approach, to cranial base, 806

Transfemoral angiography, in carotid body tumors, 493, 495f

Transhyoid pharyngotomy, 276, 339

  for thyroglossal duct cyst, 1411, 1413f–1414f

Translabyrinthine approach

  for acoustic neuroma, 962–963, 962f–963f

  of facial nerve, tumors of, 957, 957f

  for petrous apex, lesion of, 989–991, 990f

  in temporal bone trauma, 1003–1004, 1003f

Translocated facial bone graft, viability of, 305–306

Transmastoid, middle fossa craniotomy approach, in temporal bone trauma, 1003, 1003f

Transmastoid approach, of facial nerve, tumors of, 955, 955f

Transmaxillary approach, for juvenile angiofibroma, 823

Transnasal approach, to cervical spine

  complications of, 830

  contraindications to, 827

  technique of, 828, 828f–829f

Transnasal biopsy, 4

Transnasal esophagoscope (TNE), 175

Transoral approach

  to cervical spine

complications of, 830
contraindications to, 827
technique of, 828–829, 829f
to parapharyngeal space, 476–479.e1
to prestyloid tumors, 489
Transoral CO_2 laser microsurgery, for laryngeal cancer, 83–91.e1, 84f
alternative management plan for, 90
anesthesia for, 85
common errors in technique for, 90
complications of, 90
contraindications to, 84–85
history of, 83
imaging for, 84
indications for, 84
instruments and equipment for, 85–86, 85f
key anatomic landmarks for, 86
monitoring for, 85
operative period in, 85–90
operative risks of, 86
perioperative antibiotic prophylaxis for, 85
physical examination for, 84
positioning for, 85
postoperative management of, 90
postoperative period in, 90
preoperative period in, 83–85
preoperative preparation for, 85
prerequisite skills for, 86
safety precautions and management of, 84t

surgical technique of, 86
Transoral electrocautery, for soft palate cancer, 263
Transoral endotracheal intubation, during EXIT procedure, 1390f
Transoral excision, of oropharyngeal malignancy, 237–242.e1
alternative management plan for, 241
anesthesia for, 239
common errors in technique for, 240
complications of, 240–241
contraindications to, 238, 238f
history of, 237
imaging for, 238
indications for, 238, 238f
instruments and equipment for, 239
key anatomic landmarks for, 239, 239f
monitoring for, 239
operative risks of, 239
perioperative antibiotic prophylaxis for, 239
physical examination for, 237–238
positioning for, 239
postoperative management of, 240
preoperative preparation for, 238–239
prerequisite skills for, 239
surgical technique of, 239–240, 239f–241f
Transoral laser microsurgery (TLM)
of base of tongue, 243–248.e1
alternative management plans for, 248
anesthesia for, 244
common errors in technique for, 246

complications of, 247, 247f
contraindications to, 244
history of, 243
imaging for, 244
indications for, 244
instruments in, 245, 245f
key anatomic landmarks for, 245–246
monitoring for, 245
physical examination for, 243
positioning for, 244
postoperative management of, 246–247
preoperative antibiotic prophylaxis for, 244–245
preoperative preparation for, 244
prerequisite skills for, 246
risks of, 246
technique for, 246
for soft palate cancer, 263
Transoral resection, for soft palate cancer, 263
Transoral robotic surgery (TORS), 113, 1281
for base of tongue neoplasms, 256–260.e1
alternative management plan for, 260
anesthesia for, 257
common errors in technique for, 259
complications of, 260
contraindications to, 257
history of, 256
imaging for, 256–257
indications for, 257

instruments and equipment for, 258, 258f
key anatomic landmarks for, 258
physical examination for, 256
positioning for, 257, 257f
postoperative management of, 259–260
preoperative antibiotic prophylaxis for, 258
preoperative preparation for, 257
prerequisite skills for, 258
risks of, 258
technique for, 258–259, 258f–259f
for management of unknown primary cancer, 421–422, 421f–422f
in robotic-assisted nasopharyngectomy, 296f
for soft palate cancer, 263
transcervical pharyngotomy and, 277
Transoral surgery, for cancer of base of tongue, technique of, 251–252, 252f–253f
Transotic approach, for petrous apex, lesion of, 991, 991f
Transpalatal advancement pharyngoplasty, 377
common errors in technique for, 382
complications of, 382
drug-induced sedated endoscopy before, 379, 379f
indications for, 379
instruments and equipment for, 380
key anatomic landmarks for, 380
prerequisite skills for, 380
surgical technique of, 381–382, 381f–382f
Transpalatal technique, for choanal atresia repair, 1329, 1330f
Transparotid approach, to poststyloid parapharyngeal space, 489, 490f

Transseptal approach, in endoscopic sphenoidotomy, 729
Transthoracic contrast echocardiography (TTCE), of hereditary hemorrhagic telangiectasia, 669
Transthyroid cartilage, in percutaneous injection technique, 3
Transverse cordotomy, for bilateral vocal fold immobility, 55–56, 56f
with medial arytenoidectomy, 56
Trapezius flaps, 1200
common errors in technique for, 1201
contraindications to, 1200–1201
indications for, 1200
lateral, 1201
lower, 1201, 1202f
operative period in, 1201
preoperative period in, 1200
superior, 1200
surgical technique of, 1201
Trauma
acquired laryngeal stenosis from, 61
to facial and oropharyngeal area, after adenoidectomy, 1345
laryngeal, 44–51.e1
Traumatic soft tissue injuries, to neck, management of, 504–512.e1
alternative management plan for, 511
anesthesia for, 505–506
common errors in technique for, 511
complications of, 511
contraindications to, 505
history of, 504
imaging for, 504–505

indications for, 505
instruments and equipment for, 506
monitoring for, 506
operative period in, 505–511
operative risks of, 506
perioperative antibiotic prophylaxis for, 506
physical examination for, 504
positioning for, 506
postoperative management of, 511
postoperative period in, 511
preoperative period in, 504–505
preoperative preparation for, 505
prerequisite skills for, 506
surgical techniques in, 506–511
Trephination, of frontal sinus, 734–737.e1
alternative management plan for, 736
anesthesia for, 734
common errors in technique for, 736
complications of, 736
contraindications to, 734
imaging for, 734
indications for, 734
instruments and equipment for, 735
key anatomic landmarks for, 735, 735f
monitoring for, 735
operative period in, 734–736
operative risks of, 735
physical examination for, 734

positioning for, 735
postoperative management of, 736
postoperative period in, 736
preoperative period in, 734
preoperative preparation for, 734
prerequisite skills for, 735
surgical technique of, 735–736
Trichloroacetic acid peel, 1099
Trichoepithelioma, determining surgical margins in, 1117
Trichomonas vaginalis infections, human papillomavirus and, 15
Trigeminal nerve
examination of, in brow lift, 1078
morbidity in, after facial translocation approach, 315
Trismus
after facial translocation approach, 315
examination of, for maxillary swing/transpalatal/midface degloving with Le Fort I osteotomy approach, 302
Truncation technique, of vocal cord, 11–12, 12f
Tube extrusion
premature, myringotomy and tube placement and, 873
tympanic membrane perforation following, myringotomy and tube placement and, 873
Tube obstruction
after open tracheostomy, 143
myringotomy and tube placement and, 872
Tubercle of Zukerkandl, 529
Tumors
of deep lobe

malignant, 622
with parapharyngeal extension, surgical technique of, 621–622, 621f–622f
embolization of, for juvenile angiofibroma, 821
of facial nerve, 952–959.e1, 952f
alternative management plan, 958
anesthesia for, 954
common errors in technique for, 958
complications of, 958
contraindications to, 954
history of, 952–953
imaging for, 953
indications for, 953–954
instruments and equipment for, 954
key anatomic landmarks for, 954–955
monitoring for, 954
operative period in, 954–958
operative risks of, 955
perioperative antibiotic prophylaxis for, 954
physical examination for, 953, 953t
positioning for, 954
postoperative management of, 958
postoperative period in, 958
preoperative period in, 952–954
preoperative preparation for, 954
prerequisite skills for, 955
surgical technique of, 955
tracheal, tracheal resection for, 157

Tuning fork examination, for ossicular chain reconstruction, 892
Turbinate, surgery of, 647–653.e1
alternative management of, 652
anesthesia for, 649
common errors in technique for, 651, 651f
complications of, 652
contraindication to, 648–649
history of, 647–648, 648b
imaging for, 648
indication for, 648
instruments and equipment for, 649
key anatomic landmarks for, 649–650
monitoring for, 649
operative period in, 649–651
operative risks of, 650
perioperative antibiotic prophylaxis for, 649
physical examination for, 648, 648t
positioning for, 649
postoperative management of, 651–652
postoperative period in, 651–652
preoperative period in, 647–649
preoperative preparation for, 649
prerequisite skills for, 650
surgical technique of, 650
Turbinate hypertrophy, 647
Turnover flaps, for nasal reconstruction, 1138
Two-flap palatoplasty with intravelar veloplasty, 1462–1464, 1463f
Tympanic membrane (TM)

abnormalities of, in adenoidectomy, 1342
anesthesia of, 839
atelectatic, myringotomy and tube placement and, 871
bulging of, 1430
perforation of, 873, 1430
after middle ear reconstruction, 1446
in Maxum Hearing Implant System, 937
from otosclerosis, 908
in petrous apex, lesion of, 992
retracted, Eustachian tube dysfunction and, 868
Tympanocentesis, 1429
indications for, 868
instruments and equipment for, 870
perioperative antibiotic prophylaxis for, 869
techniques for, 871
Tympanomastoidectomy with exteriorization, for petrous apex, lesion of, 989, 990f
Tympanomeatal flap, 893, 893f, 1442, 1442f
Tympanometry, in testing for otitis media, 868
Tympanoplasty, 869, 869f, 883–887, 890
alternative management plan for, 888
anesthesia for, 881, 881f
audiogram and, 880–881
cartilage inlay technique for, 883, 883f–884f
common errors in technique for, 888
complications of, 888
contraindications to, 881
history of, 880

imaging for, 881
indications for, 881
instruments and equipment for, 881
key anatomic landmarks for, 882
lateral grafting technique for, 884, 884f–888f
monitoring for, 881
operative period in, 881–888
perioperative antibiotic prophylaxis for, 881
physical examination for, 880
positioning for, 881
postoperative management of, 888

Renegade:
Adjective
‘Having rejected tradition: Unconventional.’
Merriam-Webster Dictionary

Acquiescence to tyranny is the death of the spirit

You may be 38 years old, as I happen to be. And one day, some great opportunity stands before you and calls you to stand up for some great principle, some great issue, some great cause. And you refuse to do it because you are afraid … You refuse to do it because you want to live longer … You're afraid that you will lose your job, or you are afraid that you will be criticised or that you will lose your popularity, or you're afraid that somebody will stab you, or shoot at you or bomb your house; so you refuse to take the stand.

Well, you may go on and live until you are 90, but you're just as dead at 38 as you would be at 90. And the cessation of breathing in your life is but the belated announcement of an earlier death of the spirit.

Martin Luther King

How the few control the many and always have – the many do whatever they're told

'Forward, the Light Brigade!'
Was there a man dismayed?
Not though the soldier knew
Someone had blundered.
Theirs not to make reply,
Theirs not to reason why,
Theirs but to do and die.
Into the valley of Death
Rode the six hundred.

Cannon to right of them,
Cannon to left of them,
Cannon in front of them
Volleyed and thundered;
Stormed at with shot and shell,
Boldly they rode and well,
Into the jaws of Death,
Into the mouth of hell
Rode the six hundred

Alfred Lord Tennyson (1809-1892)

The mist is lifting slowly
I can see the way ahead
And I've left behind the empty streets
That once inspired my life
And the strength of the emotion
Is like thunder in the air
'Cos the promise that we made each other
Haunts me to the end

The secret of your beauty
And the mystery of your soul
I've been searching for in everyone I meet
And the times I've been mistaken
It's impossible to say
And the grass is growing
Underneath our feet

The words that I remember
From my childhood still are true
That there's none so blind
As those who will not see
And to those who lack the courage
And say it's dangerous to try
Well they just don't know
That love eternal will not be denied

I know you're out there somewhere
Somewhere, somewhere
I know you're out there somewhere

Somewhere you can hear my voice
I know I'll find you somehow
Somehow, somehow
I know I'll find you somehow
And somehow I'll return again to you

The Moody Blues

Are you a gutless wonder - or a Renegade Mind?

Monuments put from pen to paper,
Turns me into a gutless wonder,
And if you tolerate this,
Then your children will be next.
Gravity keeps my head down,
Or is it maybe shame ...

Manic Street Preachers

Rise like lions after slumber
In unvanquishable number.
Shake your chains to earth like dew
Which in sleep have fallen on you.
Ye are many – they are few.

Percy Shelley

CHAPTER ONE

I'm thinking' – Oh, but *are* you?

Think for yourself and let others enjoy the privilege of doing so too
Voltaire

French-born philosopher, mathematician and scientist René Descartes became famous for his statement in Latin in the 17th century which translates into English as: 'I think, therefore I am.'

On the face of it that is true. Thought reflects perception and perception leads to both behaviour and self-identity. In that sense 'we' are what we think. But who or what is doing the thinking and is thinking the only route to perception? Clearly, as we shall see, 'we' are not always the source of 'our' perception, indeed with regard to humanity as a whole this is rarely the case; and thinking is far from the only means of perception. Thought is the village idiot compared with other expressions of consciousness that we all have the potential to access and tap into. This has to be true when we *are* those other expressions of consciousness which are infinite in nature. We have forgotten this, or, more to the point, been manipulated to forget.

These are not just the esoteric musings of the navel. The whole foundation of human control and oppression is control of perception. Once perception is hijacked then so is behaviour which is dictated by perception. Collective perception becomes collective behaviour and collective behaviour is what we call human society. Perception is all and those behind human control know that which is

why perception is the target 24/7 of the psychopathic manipulators that I call the Global Cult. They know that if they dictate perception they will dictate behaviour and collectively dictate the nature of human society. They are further aware that perception is formed from information received and if they control the circulation of information they will to a vast extent direct human behaviour. Censorship of information and opinion has become globally Nazi-like in recent years and never more blatantly than since the illusory 'virus pandemic' was triggered out of China in 2019 and across the world in 2020. Why have billions submitted to house arrest and accepted fascistic societies in a way they would have never believed possible? Those controlling the information spewing from government, mainstream media and Silicon Valley (all controlled by the same Global Cult networks) told them they were in danger from a 'deadly virus' and only by submitting to house arrest and conceding their most basic of freedoms could they and their families be protected. This monumental and provable lie became the *perception* of the billions and therefore the *behaviour* of the billions. In those few words you have the whole structure and modus operandi of human control. Fear is a perception – **F**alse **E**motion **A**ppearing **R**eal – and fear is the currency of control. In short … get them by the balls (or give them the impression that you have) and their hearts and minds will follow. Nothing grips the dangly bits and freezes the rear-end more comprehensively than fear.

World number 1

There are two 'worlds' in what appears to be one 'world' and the prime difference between them is knowledge. First we have the mass of human society in which the population is maintained in coldly-calculated ignorance through control of information and the 'education' (indoctrination) system. That's all you really need to control to enslave billions in a perceptual delusion in which what are perceived to be *their* thoughts and opinions are ever-repeated mantras that the system has been downloading all their lives through 'education', media, science, medicine, politics and academia

in which the personnel and advocates are themselves overwhelmingly the perceptual products of the same repetition. Teachers and academics in general are processed by the same programming machine as everyone else, but unlike the great majority they never leave the 'education' program. It gripped them as students and continues to grip them as programmers of subsequent generations of students. The programmed become the programmers – the programmed programmers. The same can largely be said for scientists, doctors and politicians and not least because as the American writer Upton Sinclair said: 'It is difficult to get a man to understand something when his salary depends upon his not understanding it.' If your career and income depend on thinking the way the system demands then you will – bar a few free-minded exceptions – concede your mind to the Perceptual Mainframe that I call the Postage Stamp Consensus. This is a tiny band of perceived knowledge and possibility 'taught' (downloaded) in the schools and universities, pounded out by the mainstream media and on which all government policy is founded. Try thinking, and especially speaking and acting, outside of the 'box' of consensus and see what that does for your career in the Mainstream Everything which bullies, harasses, intimidates and ridicules the population into compliance. Here we have the simple structure which enslaves most of humanity in a perceptual prison cell for an entire lifetime and I'll go deeper into this process shortly. Most of what humanity is taught as fact is nothing more than programmed belief. American science fiction author Frank Herbert was right when he said: 'Belief can be manipulated. Only knowledge is dangerous.' In the 'Covid' age belief is promoted and knowledge is censored. It was always so, but never to the extreme of today.

World number 2

A 'number 2' is slang for 'doing a poo' and how appropriate that is when this other 'world' is doing just that on humanity every minute of every day. World number 2 is a global network of secret societies and semi-secret groups dictating the direction of society via

governments, corporations and authorities of every kind. I have spent more than 30 years uncovering and exposing this network that I call the Global Cult and knowing its agenda is what has made my books so accurate in predicting current and past events. Secret societies are secret for a reason. They want to keep their hoarded knowledge to themselves and their chosen initiates and to hide it from the population which they seek through ignorance to control and subdue. The whole foundation of the division between World 1 and World 2 is *knowledge*. What number 1 knows number 2 must not. Knowledge they have worked so hard to keep secret includes (a) the agenda to enslave humanity in a centrally-controlled global dictatorship, and (b) the nature of reality and life itself. The latter (b) must be suppressed to allow the former (a) to prevail as I shall be explaining. The way the Cult manipulates and interacts with the population can be likened to a spider's web. The 'spider' sits at the centre in the shadows and imposes its will through the web with each strand represented in World number 2 by a secret society, satanic or semi-secret group, and in World number 1 – the world of the seen – by governments, agencies of government, law enforcement, corporations, the banking system, media conglomerates and Silicon Valley (Fig 1 overleaf). The spider and the web connect and coordinate all these organisations to pursue the same global outcome while the population sees them as individual entities working randomly and independently. At the level of the web governments *are* the banking system *are* the corporations *are* the media *are* Silicon Valley *are* the World Health Organization working from their inner cores as one unit. Apparently unconnected countries, corporations, institutions, organisations and people are on the *same team* pursuing the same global outcome. Strands in the web immediately around the spider are the most secretive and exclusive secret societies and their membership is emphatically restricted to the Cult inner-circle emerging through the generations from particular bloodlines for reasons I will come to. At the core of the core you would get them in a single room. That's how many people are dictating the direction of human society and its transformation

through the ‘Covid’ hoax and other means. As the web expands out from the spider we meet the secret societies that many people will be aware of – the Freemasons, Knights Templar, Knights of Malta, Opus Dei, the inner sanctum of the Jesuit Order, and such like. Note how many are connected to the Church of Rome and there is a reason for that. The Roman Church was established as a revamp, a rebranding, of the relocated ‘Church’ of Babylon and the Cult imposing global tyranny today can be tracked back to Babylon and Sumer in what is now Iraq.

Figure 1: The global web through which the few control the many. (Image Neil Hague.)

Inner levels of the web operate in the unseen away from the public eye and then we have what I call the cusp organisations located at the point where the hidden meets the seen. They include a series of satellite organisations answering to a secret society founded in London in the late 19th century called the Round Table and among them are the Royal Institute of International Affairs (UK, founded in 1920); Council on Foreign Relations (US, 1921); Bilderberg Group (worldwide, 1954); Trilateral Commission (US/worldwide, 1972); and the Club of Rome (worldwide, 1968) which was created to exploit environmental concerns to justify the centralisation of global power to ‘save the planet’. The Club of Rome instigated with others the human-caused climate change hoax which has led to all the ‘green

new deals' demanding that very centralisation of control. Cusp organisations, which include endless 'think tanks' all over the world, are designed to coordinate a single global policy between political and business leaders, intelligence personnel, media organisations and anyone who can influence the direction of policy in their own sphere of operation. Major players and regular attenders will know what is happening – or some of it – while others come and go and are kept overwhelmingly in the dark about the big picture. I refer to these cusp groupings as semi-secret in that they can be publicly identified, but what goes on at the inner-core is kept very much 'in house' even from most of their members and participants through a fiercely-imposed system of compartmentalisation. Only let them know what they need to know to serve your interests and no more. The structure of secret societies serves as a perfect example of this principle. Most Freemasons never get higher than the bottom three levels of 'degree' (degree of knowledge) when there are 33 official degrees of the Scottish Rite. Initiates only qualify for the next higher 'compartment' or degree if those at that level choose to allow them. Knowledge can be carefully assigned only to those considered 'safe'. I went to my local Freemason's lodge a few years ago when they were having an 'open day' to show how cuddly they were and when I chatted to some of them I was astonished at how little the rank and file knew even about the most ubiquitous symbols they use. The mushroom technique – keep them in the dark and feed them bullshit – applies to most people in the web as well as the population as a whole. Sub-divisions of the web mirror in theme and structure transnational corporations which have a headquarters somewhere in the world dictating to all their subsidiaries in different countries. Subsidiaries operate in their methodology and branding to the same centrally-dictated plan and policy in pursuit of particular ends. The Cult web functions in the same way. Each country has its own web as a subsidiary of the global one. They consist of networks of secret societies, semi-secret groups and bloodline families and their job is to impose the will of the spider and the global web in their particular country. Subsidiary networks control and manipulate the national political system, finance, corporations, media, medicine, etc. to

ensure that they follow the globally-dictated Cult agenda. These networks were the means through which the 'Covid' hoax could be played out with almost every country responding in the same way.

The 'Yessir' pyramid

Compartmentalisation is the key to understanding how a tiny few can dictate the lives of billions when combined with a top-down sequence of imposition and acquiescence. The inner core of the Cult sits at the peak of the pyramidal hierarchy of human society (Fig 2 overleaf). It imposes its will – its agenda for the world – on the level immediately below which acquiesces to that imposition. This level then imposes the Cult will on the level below them which acquiesces and imposes on the next level. Very quickly we meet levels in the hierarchy that have no idea there even is a Cult, but the sequence of imposition and acquiescence continues down the pyramid in just the same way. 'I don't know why we are doing this but the order came from "on-high" and so we better just do it.' Alfred Lord Tennyson said of the cannon fodder levels in his poem *The Charge of the Light Brigade*: 'Theirs not to reason why; theirs but to do and die.' The next line says that 'into the valley of death rode the six hundred' and they died because they obeyed without question what their perceived 'superiors' told them to do. In the same way the population capitulated to 'Covid'. The whole hierarchical pyramid functions like this to allow the very few to direct the enormous many. Eventually imposition-acquiescence-imposition-acquiescence comes down to the mass of the population at the foot of the pyramid. If they acquiesce to those levels of the hierarchy imposing on them (governments/law enforcement/doctors/media) a circuit is completed between the population and the handful of super-psychopaths in the Cult inner core at the top of the pyramid. Without a circuit-breaking refusal to obey, the sequence of imposition and acquiescence allows a staggeringly few people to impose their will upon the entirety of humankind. We are looking at the very sequence that has subjugated billions since the start of 2020. Our freedom has not been taken from us. Humanity has given it

away. Fascists do not impose fascism because there are not enough of them. Fascism is imposed by the population acquiescing to fascism. Put another way allowing their perceptions to be programmed to the extent that leads to the population giving their freedom away by giving their perceptions – their mind – away. If this circuit is not broken by humanity ceasing to cooperate with their own enslavement then nothing can change. For that to happen people have to critically think and see through the lies and window dressing and then summon the backbone to act upon what they see. The Cult spends its days working to stop either happening and its methodology is systematic and highly detailed, but it can be overcome and that is what this book is all about.

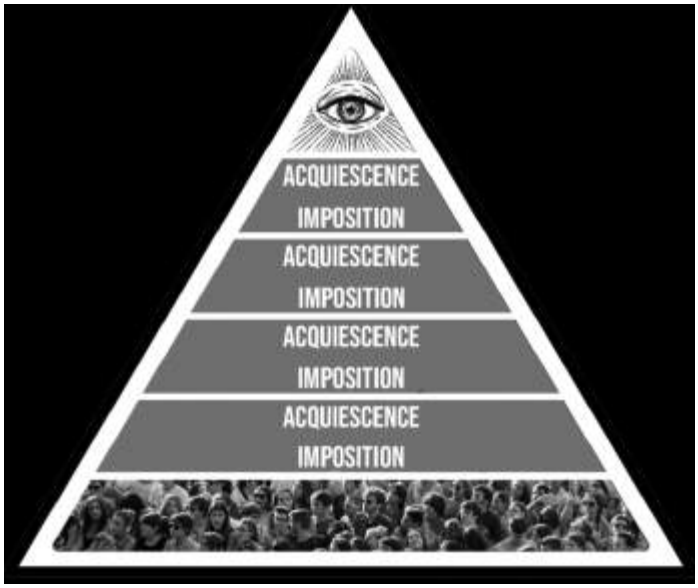

Figure 2: The simple sequence of imposition and compliance that allows a handful of people at the peak of the pyramid to dictate the lives of billions.

The Life Program

Okay, back to world number 1 or the world of the 'masses'. Observe the process of what we call 'life' and it is a perceptual download from cradle to grave. The Cult has created a global structure in which perception can be programmed and the program continually topped-up with what appears to be constant confirmation that the program is indeed true reality. The important word here is 'appears'.

This is the structure, the fly-trap, the Postage Stamp Consensus or Perceptual Mainframe, which represents that incredibly narrow band of perceived possibility delivered by the 'education' system, mainstream media, science and medicine. From the earliest age the download begins with parents who have themselves succumbed to the very programming their children are about to go through. Most parents don't do this out of malevolence and mostly it is quite the opposite. They do what they believe is best for their children and that is what the program has told them is best. Within three or four years comes the major transition from parental programming to full-blown state (Cult) programming in school, college and university where perceptually-programmed teachers and academics pass on their programming to the next generations. Teachers who resist are soon marginalised and their careers ended while children who resist are called a problem child for whom Ritalin may need to be prescribed. A few years after entering the 'world' children are under the control of authority figures representing the state telling them when they have to be there, when they can leave and when they can speak, eat, even go to the toilet. This is calculated preparation for a lifetime of obeying authority in all its forms. Reflex-action fear of authority is instilled by authority from the start. Children soon learn the carrot and stick consequences of obeying or defying authority which is underpinned daily for the rest of their life. Fortunately I daydreamed through this crap and never obeyed authority simply because it told me to. This approach to my alleged 'betters' continues to this day. There can be consequences of pursuing open-minded freedom in a world of closed-minded conformity. I spent a lot of time in school corridors after being ejected from the classroom for not taking some of it seriously and now I spend a lot of time being ejected from Facebook, YouTube and Twitter. But I can tell you that being true to yourself and not compromising your self-respect is far more exhilarating than bowing to authority for authority's sake. You don't have to be a sheep to the shepherd (authority) and the sheep dog (fear of not obeying authority).

The perceptual download continues throughout the formative years in school, college and university while script-reading 'teachers', 'academics' 'scientists', 'doctors' and 'journalists' insist that ongoing generations must be as programmed as they are. Accept the program or you will not pass your 'exams' which confirm your 'degree' of programming. It is tragic to think that many parents pressure their offspring to work hard at school to download the program and qualify for the next stage at college and university. The late, great, American comedian George Carlin said: 'Here's a bumper sticker I'd like to see: We are proud parents of a child who has resisted his teachers' attempts to break his spirit and bend him to the will of his corporate masters.' Well, the best of luck finding many of those, George. Then comes the moment to leave the formal programming years in academia and enter the 'adult' world of work. There you meet others in your chosen or prescribed arena who went through the same Postage Stamp Consensus program before you did. There is therefore overwhelming agreement between almost everyone on the basic foundations of Postage Stamp reality and the rejection, even contempt, of the few who have a mind of their own and are prepared to use it. This has two major effects. Firstly, the consensus confirms to the programmed that their download is really how things are. I mean, everyone knows that, right? Secondly, the arrogance and ignorance of Postage Stamp adherents ensure that anyone questioning the program will have unpleasant consequences for seeking their own truth and not picking their perceptions from the shelf marked: 'Things you must believe without question and if you don't you're a dangerous lunatic conspiracy theorist and a harebrained nutter'.

Every government, agency and corporation is founded on the same Postage Stamp prison cell and you can see why so many people believe the same thing while calling it their own 'opinion'. Fusion of governments and corporations in pursuit of the same agenda was the definition of fascism described by Italian dictator Benito Mussolini. The pressure to conform to perceptual norms downloaded for a lifetime is incessant and infiltrates society right

down to family groups that become censors and condemners of their own 'black sheep' for not, ironically, being sheep. We have seen an explosion of that in the 'Covid' era. Cult-owned global media unleashes its propaganda all day every day in support of the Postage Stamp and targets with abuse and ridicule anyone in the public eye who won't bend their mind to the will of the tyranny. Any response to this is denied (certainly in my case). They don't want to give a platform to expose official lies. Cult-owned-and-created Internet giants like Facebook, Google, YouTube and Twitter delete you for having an unapproved opinion. Facebook boasts that its AI censors delete 97-percent of 'hate speech' before anyone even reports it. Much of that 'hate speech' will simply be an opinion that Facebook and its masters don't want people to see. Such perceptual oppression is widely known as fascism. Even Facebook executive Benny Thomas, a 'CEO Global Planning Lead', said in comments secretly recorded by investigative journalism operation Project Veritas that Facebook is 'too powerful' and should be broken up:

I mean, no king in history has been the ruler of two billion people, but Mark Zuckerberg is … And he's 36. That's too much for a 36-year-old ... You should not have power over two billion people. I just think that's wrong.

Thomas said Facebook-owned platforms like Instagram, Oculus, and WhatsApp needed to be separate companies. 'It's too much power when they're all one together'. That's the way the Cult likes it, however. We have an executive of a Cult organisation in Benny Thomas that doesn't know there is a Cult such is the compartmentalisation. Thomas said that Facebook and Google 'are no longer companies, they're countries'. Actually they are more powerful than countries on the basis that if you control information you control perception and control human society.

I love my oppressor

Another expression of this psychological trickery is for those who realise they are being pressured into compliance to eventually

convince themselves to believe the official narratives to protect their self-respect from accepting the truth that they have succumbed to meek and subservient compliance. Such people become some of the most vehement defenders of the system. You can see them everywhere screaming abuse at those who prefer to think for themselves and by doing so reminding the compliers of their own capitulation to conformity. 'You are talking dangerous nonsense you Covidiot!!' Are you trying to convince me or yourself? It is a potent form of Stockholm syndrome which is defined as: 'A psychological condition that occurs when a victim of abuse identifies and attaches, or bonds, positively with their abuser.' An example is hostages bonding and even 'falling in love' with their kidnappers. The syndrome has been observed in domestic violence, abused children, concentration camp inmates, prisoners of war and many and various Satanic cults. These are some traits of Stockholm syndrome listed at goodtherapy.org:

- Positive regard towards perpetrators of abuse or captor [see 'Covid'].
- Failure to cooperate with police and other government authorities when it comes to holding perpetrators of abuse or kidnapping accountable [or in the case of 'Covid' cooperating with the police to enforce and defend their captors' demands].
- Little or no effort to escape [see 'Covid'].
- Belief in the goodness of the perpetrators or kidnappers [see 'Covid'].
- Appeasement of captors. This is a manipulative strategy for maintaining one's safety. As victims get rewarded – perhaps with less abuse or even with life itself – their appeasing behaviours are reinforced [see 'Covid'].
- Learned helplessness. This can be akin to 'if you can't beat 'em, join 'em'. As the victims fail to escape the abuse or captivity, they may start giving up and soon realize it's just easier for everyone if they acquiesce all their power to their captors [see 'Covid'].

- Feelings of pity toward the abusers, believing they are actually victims themselves. Because of this, victims may go on a crusade or mission to 'save' [protect] their abuser [see the venom unleashed on those challenging the official 'Covid' narrative].
- Unwillingness to learn to detach from their perpetrators and heal. In essence, victims may tend to be less loyal to themselves than to their abuser [*definitely* see 'Covid'].

Ponder on those traits and compare them with the behaviour of great swathes of the global population who have defended governments and authorities which have spent every minute destroying their lives and livelihoods and those of their children and grandchildren since early 2020 with fascistic lockdowns, house arrest and employment deletion to 'protect' them from a 'deadly virus' that their abusers' perceptually created to bring about this very outcome. We are looking at mass Stockholm syndrome. All those that agree to concede their freedom will believe those perceptions are originating in their own independent 'mind' when in fact by conceding their reality to Stockholm syndrome they have by definition conceded any independence of mind. Listen to the 'opinions' of the acquiescing masses in this 'Covid' era and what gushes forth is the repetition of the official version of everything delivered unprocessed, unfiltered and unquestioned. The whole programming dynamic works this way. I must be free because I'm told that I am and so I think that I am.

You can see what I mean with the chapter theme of 'I'm thinking – Oh, but *are* you?' The great majority are not thinking, let alone for themselves. They are repeating what authority has told them to believe which allows them to be controlled. Weaving through this mentality is the fear that the 'conspiracy theorists' are right and this again explains the often hysterical abuse that ensues when you dare to contest the official narrative of anything. Denial is the mechanism of hiding from yourself what you don't want to be true. Telling people what they want to hear is easy, but it's an infinitely greater challenge to tell them what they would rather not be happening.

One is akin to pushing against an open door while the other is met with vehement resistance no matter what the scale of evidence. I don't want it to be true so I'll convince myself that it's not. Examples are everywhere from the denial that a partner is cheating despite all the signs to the reflex-action rejection of any idea that world events in which country after country act in exactly the same way are centrally coordinated. To accept the latter is to accept that a force of unspeakable evil is working to destroy your life and the lives of your children with nothing too horrific to achieve that end. Who the heck wants that to be true? But if we don't face reality the end is duly achieved and the consequences are far worse and ongoing than breaking through the walls of denial today with the courage to make a stand against tyranny.

Connect the dots – but how?

A crucial aspect of perceptual programming is to portray a world in which everything is random and almost nothing is connected to anything else. Randomness cannot be coordinated by its very nature and once you perceive events as random the idea they could be connected is waved away as the rantings of the tinfoil-hat brigade. You can't plan and coordinate random you idiot! No, you can't, but you can hide the coldly-calculated and long-planned behind the *illusion* of randomness. A foundation manifestation of the Renegade Mind is to scan reality for patterns that connect the apparently random and turn pixels and dots into pictures. This is the way I work and have done so for more than 30 years. You look for similarities in people, modus operandi and desired outcomes and slowly, then ever quicker, the picture forms. For instance: There would seem to be no connection between the 'Covid pandemic' hoax and the human-caused global-warming hoax and yet they are masks (appropriately) on the same face seeking the same outcome. Those pushing the global warming myth through the Club of Rome and other Cult agencies are driving the lies about 'Covid' – Bill Gates is an obvious one, but they are endless. Why would the same people be involved in both when they are clearly not connected? Oh, but they

are. Common themes with personnel are matched by common goals. The 'solutions' to both 'problems' are centralisation of global power to impose the will of the few on the many to 'save' humanity from 'Covid' and save the planet from an 'existential threat' (we need 'zero Covid' and 'zero carbon emissions'). These, in turn, connect with the 'dot' of globalisation which was coined to describe the centralisation of global power in every area of life through incessant political and corporate expansion, trading blocks and superstates like the European Union. If you are the few and you want to control the many you have to centralise power and decision-making. The more you centralise power the more power the few at the centre will have over the many; and the more that power is centralised the more power those at the centre have to centralise even quicker. The momentum of centralisation gets faster and faster which is exactly the process we have witnessed. In this way the hoaxed 'pandemic' and the fakery of human-caused global warming serve the interests of globalisation and the seizure of global power in the hands of the Cult inner-circle which is behind 'Covid', 'climate change' *and* globalisation. At this point random 'dots' become a clear and obvious picture or pattern.

Klaus Schwab, the classic Bond villain who founded the Cult's Gates-funded World Economic Forum, published a book in 2020, *The Great Reset*, in which he used the 'problem' of 'Covid' to justify a total transformation of human society to 'save' humanity from 'climate change'. Schwab said: 'The pandemic represents a rare but narrow window of opportunity to reflect, reimagine, and reset our world.' What he didn't mention is that the Cult he serves is behind both hoaxes as I show in my book *The Answer*. He and the Cult don't have to reimagine the world. They know precisely what they want and that's why they destroyed human society with 'Covid' to 'build back better' in their grand design. Their job is not to imagine, but to get humanity to imagine and agree with their plans while believing it's all random. It must be pure coincidence that 'The Great Reset' has long been the Cult's code name for the global imposition of fascism and replaced previous code-names of the 'New World

Order' used by Cult frontmen like Father George Bush and the 'New Order of the Ages' which emerged from Freemasonry and much older secret societies. New Order of the Ages appears on the reverse of the Great Seal of the United States as 'Novus ordo seclorum' underneath the Cult symbol used since way back of the pyramid and all seeing-eye (Fig 3). The pyramid is the hierarchy of human control headed by the illuminated eye that symbolises the force behind the Cult which I will expose in later chapters. The term 'Annuit Coeptis' translates as 'He favours our undertaking'. We are told the 'He' is the Christian god, but 'He' is not as I will be explaining.

Figure 3: The all-seeing eye of the Cult 'god' on the Freemason-designed Great Seal of the United States and also on the dollar bill.

Having you on

Two major Cult techniques of perceptual manipulation that relate to all this are what I have called since the 1990s Problem-Reaction-Solution (PRS) and the Totalitarian Tiptoe (TT). They can be uncovered by the inquiring mind with a simple question: Who benefits? The answer usually identifies the perpetrators of a given action or happening through the concept of 'he who most benefits from a crime is the one most likely to have committed it'. The Latin 'Cue bono?' – Who benefits? – is widely attributed to the Roman orator and statesman Marcus Tullius Cicero. No wonder it goes back so far when the concept has been relevant to human behaviour since

history was recorded. Problem-Reaction-Solution is the technique used to manipulate us every day by covertly creating a problem (or the illusion of one) and offering the solution to the problem (or the illusion of one). In the first phase you create the problem and blame someone or something else for why it has happened. This may relate to a financial collapse, terrorist attack, war, global warming or pandemic, anything in fact that will allow you to impose the 'solution' to change society in the way you desire at that time. The 'problem' doesn't have to be real. PRS is manipulation of perception and all you need is the population to believe the problem is real. Human-caused global warming and the 'Covid pandemic' only have to be *perceived* to be real for the population to accept the 'solutions' of authority. I refer to this technique as NO-Problem-Reaction-Solution. Billions did not meekly accept house arrest from early 2020 because there was a real deadly 'Covid pandemic' but because they perceived – believed – that to be the case. The antidote to Problem-Reaction-Solution is to ask who benefits from the proposed solution. Invariably it will be anyone who wants to justify more control through deletion of freedom and centralisation of power and decision-making.

The two world wars were Problem-Reaction-Solutions that transformed and realigned global society. Both were manipulated into being by the Cult as I have detailed in books since the mid-1990s. They dramatically centralised global power, especially World War Two, which led to the United Nations and other global bodies thanks to the overt and covert manipulations of the Rockefeller family and other Cult bloodlines like the Rothschilds. The UN is a stalking horse for full-blown world government that I will come to shortly. The land on which the UN building stands in New York was donated by the Rockefellers and the same Cult family was behind Big Pharma scalpel and drug 'medicine' and the creation of the World Health Organization as part of the UN. They have been stalwarts of the eugenics movement and funded Hitler's race-purity expert' Ernst Rudin. The human-caused global warming hoax has been orchestrated by the Club of Rome through the UN which is

manufacturing both the 'problem' through its Intergovernmental Panel on Climate Change and imposing the 'solution' through its Agenda 21 and Agenda 2030 which demand the total centralisation of global power to 'save the world' from a climate hoax the United Nations is itself perpetrating. What a small world the Cult can be seen to be particularly among the inner circles. The bedfellow of Problem-Reaction-Solution is the Totalitarian Tiptoe which became the Totalitarian Sprint in 2020. The technique is fashioned to hide the carefully-coordinated behind the cover of apparently random events. You start the sequence at 'A' and you know you are heading for 'Z'. You don't want people to know that and each step on the journey is presented as a random happening while all the steps strung together lead in the same direction. The speed may have quickened dramatically in recent times, but you can still see the incremental approach of the Tiptoe in the case of 'Covid' as each new imposition takes us deeper into fascism. Tell people they have to do this or that to get back to 'normal', then this and this and this. With each new demand adding to the ones that went before the population's freedom is deleted until it disappears. The spider wraps its web around the flies more comprehensively with each new diktat. I'll highlight this in more detail when I get to the 'Covid' hoax and how it has been pulled off. Another prime example of the Totalitarian Tiptoe is how the Cult-created European Union went from a 'free-trade zone' to a centralised bureaucratic dictatorship through the Tiptoe of incremental centralisation of power until nations became mere administrative units for Cult-owned dark suits in Brussels.

The antidote to ignorance is knowledge which the Cult seeks vehemently to deny us, but despite the systematic censorship to that end the Renegade Mind can overcome this by vociferously seeking out the facts no matter the impediments put in the way. There is also a method of thinking and perceiving – *knowing* – that doesn't even need names, dates, place-type facts to identify the patterns that reveal the story. I'll get to that in the final chapter. All you need to know about the manipulation of human society and to what end is still out there – *at the time of writing* – in the form of books, videos

and websites for those that really want to breach the walls of programmed perception. To access this knowledge requires the abandonment of the mainstream media as a source of information in the awareness that this is owned and controlled by the Cult and therefore promotes mass perceptions that suit the Cult. Mainstream media lies all day, every day. That is its function and very reason for being. Where it does tell the truth, here and there, is only because the truth and the Cult agenda very occasionally coincide. If you look for fact and insight to the BBC, CNN and virtually all the rest of them you are asking to be conned and perceptually programmed.

Know the outcome and you'll see the journey

Events seem random when you have no idea where the world is being taken. Once you do the random becomes the carefully planned. Know the outcome and you'll see the journey is a phrase I have been using for a long time to give context to daily happenings that appear unconnected. Does a problem, or illusion of a problem, trigger a proposed 'solution' that further drives society in the direction of the outcome? Invariably the answer will be yes and the random – *abracadabra* – becomes the clearly coordinated. So what is this outcome that unlocks the door to a massively expanded understanding of daily events? I will summarise its major aspects – the fine detail is in my other books – and those new to this information will see that the world they thought they were living in is a very different place. The foundation of the Cult agenda is the incessant centralisation of power and all such centralisation is ultimately in pursuit of Cult control on a global level. I have described for a long time the planned world structure of top-down dictatorship as the Hunger Games Society. The term obviously comes from the movie series which portrayed a world in which a few living in military-protected hi-tech luxury were the overlords of a population condemned to abject poverty in isolated 'sectors' that were not allowed to interact. 'Covid' lockdowns and travel bans anyone? The 'Hunger Games' pyramid of structural control has the inner circle of the Cult at the top with pretty much the entire

population at the bottom under their control through dependency for survival on the Cult. The whole structure is planned to be protected and enforced by a military-police state (Fig 4).

Here you have the reason for the global lockdowns of the fake pandemic to coldly destroy independent incomes and livelihoods and make everyone dependent on the 'state' (the Cult that controls the 'states'). I have warned in my books for many years about the plan to introduce a 'guaranteed income' – a barely survivable pittance – designed to impose dependency when employment was destroyed by AI technology and now even more comprehensively at great speed by the 'Covid' scam. Once the pandemic was played and lockdown consequences began to delete independent income the authorities began to talk right on cue about the need for a guaranteed income and a 'Great Reset'. Guaranteed income will be presented as benevolent governments seeking to help a desperate people – desperate as a direct result of actions of the same governments. The truth is that such payments are a trap. You will only get them if you do exactly what the authorities demand including mass vaccination (genetic manipulation). We have seen this theme already in Australia where those dependent on government benefits have them reduced if parents don't agree to have their children vaccinated according to an insane health-destroying government-dictated schedule. Calculated economic collapse applies to governments as well as people. The Cult wants rid of countries through the creation of a world state with countries broken up into regions ruled by a world government and super states like the European Union. Countries must be bankrupted, too, to this end and it's being achieved by the trillions in 'rescue packages' and furlough payments, trillions in lost taxation, and money-no-object spending on 'Covid' including constant all-medium advertising (programming) which has made the media dependent on government for much of its income. The day of reckoning is coming – as planned – for government spending and given that it has been made possible by printing money and not by production/taxation there is inflation on the way that has the

potential to wipe out monetary value. In that case there will be no need for the Cult to steal your money. It just won't be worth anything (see the German Weimar Republic before the Nazis took over). Many have been okay with lockdowns while getting a percentage of their income from so-called furlough payments without having to work. Those payments are dependent, however, on people having at least a theoretical job with a business considered non-essential and ordered to close. As these business go under because they are closed by lockdown after lockdown the furlough stops and it will for everyone eventually. Then what? The 'then what?' is precisely the idea.

Figure 4: The Hunger Games Society structure I have long warned was planned and now the 'Covid' hoax has made it possible. This is the real reason for lockdowns.

Hired hands

Between the Hunger Games Cult elite and the dependent population is planned to be a vicious military-police state (a fusion of the two into one force). This has been in the making for a long time with police looking ever more like the military and carrying weapons to match. The pandemic scam has seen this process accelerate so fast as

lockdown house arrest is brutally enforced by carefully recruited fascist minds and gormless system-servers. The police and military are planned to merge into a centrally-directed world army in a global structure headed by a world government which wouldn't be elected even by the election fixes now in place. The world army is not planned even to be human and instead wars would be fought, primarily against the population, using robot technology controlled by artificial intelligence. I have been warning about this for decades and now militaries around the world are being transformed by this very AI technology. The global regime that I describe is a particular form of fascism known as a technocracy in which decisions are not made by clueless and co-opted politicians but by unelected technocrats – scientists, engineers, technologists and bureaucrats. Cult-owned-and-controlled Silicon Valley giants are examples of technocracy and they already have far more power to direct world events than governments. They are with their censorship *selecting* governments. I know that some are calling the 'Great Reset' a Marxist communist takeover, but fascism and Marxism are different labels for the same tyranny. Tell those who lived in fascist Germany and Stalinist Russia that there was a difference in the way their freedom was deleted and their lives controlled. I could call it a fascist technocracy or a Marxist technocracy and they would be equally accurate. The Hunger Games society with its world government structure would oversee a world army, world central bank and single world cashless currency imposing its will on a microchipped population (Fig 5). Scan its different elements and see how the illusory pandemic is forcing society in this very direction at great speed. Leaders of 23 countries and the World Health Organization (WHO) backed the idea in March, 2021, of a global treaty for 'international cooperation' in 'health emergencies' and nations should 'come together as a global community for peaceful cooperation that extends beyond this crisis'. Cut the Orwellian bullshit and this means another step towards global government. The plan includes a cashless digital money system that I first warned about in 1993. Right at the start of 'Covid' the deeply corrupt Tedros

Adhanom Ghebreyesus, the crooked and merely gofer 'head' of the World Health Organization, said it was possible to catch the 'virus' by touching cash and it was better to use cashless means. The claim was ridiculous nonsense and like the whole 'Covid' mind-trick it was nothing to do with 'health' and everything to do with pushing every aspect of the Cult agenda. As a result of the Tedros lie the use of cash has plummeted. The Cult script involves a single world digital currency that would eventually be technologically embedded in the body. China is a massive global centre for the Cult and if you watch what is happening there you will know what is planned for everywhere. The Chinese government is developing a digital currency which would allow fines to be deducted immediately via AI for anyone caught on camera breaking its fantastic list of laws and the money is going to be programmable with an expiry date to ensure that no one can accrue wealth except the Cult and its operatives.

Figure 5: The structure of global control the Cult has been working towards for so long and this has been enormously advanced by the 'Covid' illusion.

Serfdom is so smart

The Cult plan is far wider, extreme, and more comprehensive than even most conspiracy researchers appreciate and I will come to the true depths of deceit and control in the chapters 'Who controls the

Cult?' and 'Escaping Wetiko'. Even the world that we know is crazy enough. We are being deluged with ever more sophisticated and controlling technology under the heading of 'smart'. We have smart televisions, smart meters, smart cards, smart cars, smart driving, smart roads, smart pills, smart patches, smart watches, smart skin, smart borders, smart pavements, smart streets, smart cities, smart communities, smart environments, smart growth, smart planet ... smart *everything* around us. Smart technologies and methods of operation are designed to interlock to create a global Smart Grid connecting the entirety of human society including human minds to create a centrally-dictated 'hive' mind. 'Smart cities' is code for densely-occupied megacities of total surveillance and control through AI. Ever more destructive frequency communication systems like 5G have been rolled out without any official testing for health and psychological effects (colossal). 5G/6G/7G systems are needed to run the Smart Grid and each one becomes more destructive of body and mind. Deleting independent income is crucial to forcing people into these AI-policed prisons by ending private property ownership (except for the Cult elite). The Cult's Great Reset now openly foresees a global society in which no one will own any possessions and everything will be rented while the Cult would own literally everything under the guise of government and corporations. The aim has been to use the lockdowns to destroy sources of income on a mass scale and when the people are destitute and in unrepayable amounts of debt (problem) Cult assets come forward with the pledge to write-off debt in return for handing over all property and possessions (solution). Everything – literally everything including people – would be connected to the Internet via AI. I was warning years ago about the coming Internet of Things (IoT) in which all devices and technology from your car to your fridge would be plugged into the Internet and controlled by AI. Now we are already there with much more to come. The next stage is the Internet of Everything (IoE) which is planned to include the connection of AI to the human brain and body to replace the human mind with a centrally-controlled AI mind. Instead of perceptions

being manipulated through control of information and censorship those perceptions would come direct from the Cult through AI. What do you think? You think whatever AI decides that you think. In human terms there would be no individual 'think' any longer. Too incredible? The ravings of a lunatic? Not at all. Cult-owned crazies in Silicon Valley have been telling us the plan for years without explaining the real motivation and calculated implications. These include Google executive and 'futurist' Ray Kurzweil who highlights the year 2030 for when this would be underway. He said:

Our thinking ... will be a hybrid of biological and non-biological thinking ... humans will be able to extend their limitations and 'think in the cloud' ... We're going to put gateways to the cloud in our brains ... We're going to gradually merge and enhance ourselves ... In my view, that's the nature of being human – we transcend our limitations.

As the technology becomes vastly superior to what we are then the small proportion that is still human gets smaller and smaller and smaller until it's just utterly negligible.

The sales-pitch of Kurzweil and Cult-owned Silicon Valley is that this would make us 'super-human' when the real aim is to make us post-human and no longer 'human' in the sense that we have come to know. The entire global population would be connected to AI and become the centrally-controlled 'hive-mind' of externally-delivered perceptions. The Smart Grid being installed to impose the Cult's will on the world is being constructed to allow particular locations – even one location – to control the whole global system. From these prime control centres, which absolutely include China and Israel, anything connected to the Internet would be switched on or off and manipulated at will. Energy systems could be cut, communication via the Internet taken down, computer-controlled driverless autonomous vehicles driven off the road, medical devices switched off, the potential is limitless given how much AI and Internet connections now run human society. We have seen nothing yet if we allow this to continue. Autonomous vehicle makers are working with law enforcement to produce cars designed to automatically pull over if they detect a police or emergency vehicle flashing from up to 100 feet away. At a police stop the car would be unlocked and the

window rolled down automatically. Vehicles would only take you where the computer (the state) allowed. The end of petrol vehicles and speed limiters on all new cars in the UK and EU from 2022 are steps leading to electric computerised transport over which ultimately you have no control. The picture is far bigger even than the Cult global network or web and that will become clear when I get to the nature of the 'spider'. There is a connection between all these happenings and the instigation of DNA-manipulating 'vaccines' (which aren't 'vaccines') justified by the 'Covid' hoax. That connection is the unfolding plan to transform the human body from a biological to a synthetic biological state and this is why synthetic biology is such a fast-emerging discipline of mainstream science. 'Covid vaccines' are infusing self-replicating synthetic genetic material into the cells to cumulatively take us on the Totalitarian Tiptoe from Human 1.0 to the synthetic biological Human 2.0 which will be physically and perceptually attached to the Smart Grid to one hundred percent control every thought, perception and deed. Humanity needs to wake up and *fast*.

This is the barest explanation of where the 'outcome' is planned to go but it's enough to see the journey happening all around us. Those new to this information will already see 'Covid' in a whole new context. I will add much more detail as we go along, but for the minutiae evidence see my mega-works, *The Answer, The Trigger* and *Everything You Need to Know But Have Never Been Told*.

Now – how does a Renegade Mind see the 'world'?

CHAPTER TWO

Renegade Perception

It is one thing to be clever and another to be wise
George R.R. Martin

A simple definition of the difference between a programmed mind and a Renegade Mind would be that one sees only dots while the other connects them to see the picture. Reading reality with accuracy requires the observer to (a) know the planned outcome and (b) realise that everything, but *everything*, is connected.

The entirety of infinite reality is connected – that's its very nature – and with human society an expression of infinite reality the same must apply. Simple cause and effect is a connection. The effect is triggered by the cause and the effect then becomes the cause of another effect. Nothing happens in isolation because it *can't*. Life in whatever reality is simple choice and consequence. We make choices and these lead to consequences. If we don't like the consequences we can make different choices and get different consequences which lead to other choices and consequences. The choice and the consequence are not only connected they are indivisible. You can't have one without the other as an old song goes. A few cannot control the world unless those being controlled allow that to happen – cause and effect, choice and consequence. Control – who has it and who doesn't – is a two-way process, a symbiotic relationship, involving the controller and controlled. 'They took my freedom away!!' Well, yes, but you also gave it to them. Humanity is

subjected to mass control because humanity has acquiesced to that control. This is all cause and effect and literally a case of give and take. In the same way world events of every kind are connected and the Cult works incessantly to sell the illusion of the random and coincidental to maintain the essential (to them) perception of dots that hide the picture. Renegade Minds know this and constantly scan the world for patterns of connection. This is absolutely pivotal in understanding the happenings in the world and without that perspective clarity is impossible. First you know the planned outcome and then you identify the steps on the journey – the day-by-day apparently random which, when connected in relation to the outcome, no longer appear as individual events, but as the proverbial *chain* of events leading in the same direction. I'll give you some examples:

Political puppet show

We are told to believe that politics is 'adversarial' in that different parties with different beliefs engage in an endless tussle for power. There may have been some truth in that up to a point – and only a point – but today divisions between 'different' parties are rhetorical not ideological. Even the rhetorical is fusing into one-speak as the parties eject any remaining free thinkers while others succumb to the ever-gathering intimidation of anyone with the 'wrong' opinion. The Cult is not a new phenomenon and can be traced back thousands of years as my books have documented. Its intergenerational initiates have been manipulating events with increasing effect the more that global power has been centralised. In ancient times the Cult secured control through the system of monarchy in which 'special' bloodlines (of which more later) demanded the right to rule as kings and queens simply by birthright and by vanquishing others who claimed the same birthright. There came a time, however, when people had matured enough to see the unfairness of such tyranny and demanded a say in who governed them. Note the word – *governed* them. Not served them – *governed* them, hence government defined as 'the political direction and control exercised over the

actions of the members, citizens, or inhabitants of communities, societies, and states; direction of the affairs of a state, community, etc.' Governments exercise control over rather than serve just like the monarchies before them. Bizarrely there are still countries like the United Kingdom which are ruled by a monarch *and* a government that officially answers to the monarch. The UK head of state and that of Commonwealth countries such as Canada, Australia and New Zealand is 'selected' by who in a *single family* had unprotected sex with whom and in what order. Pinch me it can't be true. Ouch! Shit, it is. The demise of monarchies in most countries offered a potential vacuum in which some form of free and fair society could arise and the Cult had that base covered. Monarchies had served its interests but they couldn't continue in the face of such widespread opposition and, anyway, replacing a 'royal' dictatorship that people could see with a dictatorship 'of the people' hiding behind the concept of 'democracy' presented far greater manipulative possibilities and ways of hiding coordinated tyranny behind the illusion of 'freedom'.

Democracy is quite wrongly defined as government selected by the population. This is not the case at all. It is government selected by *some* of the population (and then only in theory). This 'some' doesn't even have to be the majority as we have seen so often in first-past-the-post elections in which the so-called majority party wins fewer votes than the 'losing' parties combined. Democracy can give total power to a party in government from a minority of the votes cast. It's a sleight of hand to sell tyranny as freedom. Seventy-four million Trump-supporting Americans didn't vote for the 'Democratic' Party of Joe Biden in the distinctly dodgy election in 2020 and yet far from acknowledging the wishes and feelings of that great percentage of American society the Cult-owned Biden government set out from day one to destroy them and their right to a voice and opinion. Empty shell Biden and his Cult handlers said they were doing this to 'protect democracy'. Such is the level of lunacy and sickness to which politics has descended. Connect the dots and relate them to the desired outcome – a world government run by self-appointed technocrats and no longer even elected

politicians. While operating through its political agents in government the Cult is at the same time encouraging public distain for politicians by putting idiots and incompetents in theoretical power on the road to deleting them. The idea is to instil a public reaction that says of the technocrats: 'Well, they couldn't do any worse than the pathetic politicians.' It's all about controlling perception and Renegade Minds can see through that while programmed minds cannot when they are ignorant of both the planned outcome and the manipulation techniques employed to secure that end. This knowledge can be learned, however, and fast if people choose to get informed.

Politics may at first sight appear very difficult to control from a central point. I mean look at the 'different' parties and how would you be able to oversee them all and their constituent parts? In truth, it's very straightforward because of their structure. We are back to the pyramid of imposition and acquiescence. Organisations are structured in the same way as the system as a whole. Political parties are not open forums of free expression. They are hierarchies. I was a national spokesman for the British Green Party which claimed to be a different kind of politics in which influence and power was devolved; but I can tell you from direct experience – and it's far worse now – that Green parties are run as hierarchies like all the others however much they may try to hide that fact or kid themselves that it's not true. A very few at the top of all political parties are directing policy and personnel. They decide if you are elevated in the party or serve as a government minister and to do that you have to be a yes man or woman. Look at all the maverick political thinkers who never ascended the greasy pole. If you want to progress within the party or reach 'high-office' you need to fall into line and conform. Exceptions to this are rare indeed. Should you want to run for parliament or Congress you have to persuade the local or state level of the party to select you and for that you need to play the game as dictated by the hierarchy. If you secure election and wish to progress within the greater structure you need to go on conforming to what is acceptable to those running the hierarchy

from the peak of the pyramid. Political parties are perceptual gulags and the very fact that there are party 'Whips' appointed to 'whip' politicians into voting the way the hierarchy demands exposes the ridiculous idea that politicians are elected to serve the people they are supposed to represent. Cult operatives and manipulation has long seized control of major parties that have any chance of forming a government and at least most of those that haven't. A new party forms and the Cult goes to work to infiltrate and direct. This has reached such a level today that you see video compilations of 'leaders' of all parties whether Democrats, Republicans, Conservative, Labour and Green parroting the same Cult mantra of 'Build Back Better' and the 'Great Reset' which are straight off the Cult song-sheet to describe the transformation of global society in response to the Cult-instigated hoaxes of the 'Covid pandemic' and human-caused 'climate change'. To see Caroline Lucas, the Green Party MP that I knew when I was in the party in the 1980s, speaking in support of plans proposed by Cult operative Klaus Schwab representing the billionaire global elite is a real head-shaker.

Many parties – one master

The party system is another mind-trick and was instigated to change the nature of the dictatorship by swapping 'royalty' for dark suits that people believed – though now ever less so – represented their interests. Understanding this trick is to realise that a single force (the Cult) controls all parties either directly in terms of the major ones or through manipulation of perception and ideology with others. You don't need to manipulate Green parties to demand your transformation of society in the name of 'climate change' when they are obsessed with the lie that this is essential to 'save the planet'. You just give them a platform and away they go serving your interests while believing they are being environmentally virtuous. America's political structure is a perfect blueprint for how the two or multi-party system is really a one-party state. The Republican Party is controlled from one step back in the shadows by a group made up of billionaires and their gofers known as neoconservatives or Neocons.

I have exposed them in fine detail in my books and they were the driving force behind the policies of the imbecilic presidency of Boy George Bush which included 9/11 (see *The Trigger* for a comprehensive demolition of the official story), the subsequent 'war on terror' (war *of* terror) and the invasions of Afghanistan and Iraq. The latter was a No-Problem-Reaction-Solution based on claims by Cult operatives, including Bush and British Prime Minister Tony Blair, about Saddam Hussein's 'weapons of mass destruction' which did not exist as war criminals Bush and Blair well knew.

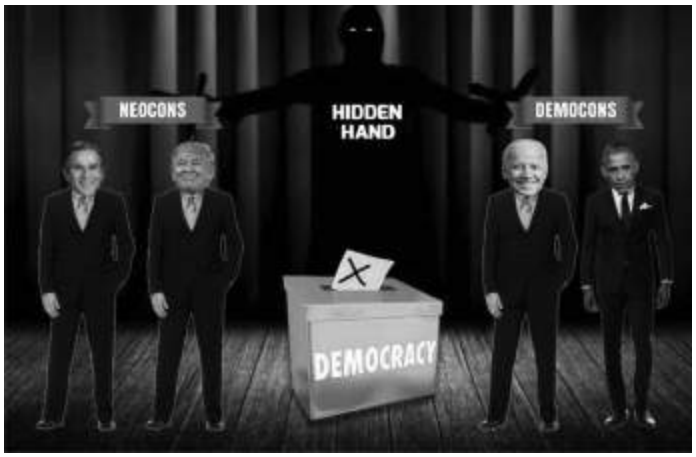

Figure 6: Different front people, different parties – same control system.

The Democratic Party has its own 'Neocon' group controlling from the background which I call the 'Democons' and here's the penny-drop – the Neocons and Democons answer to the same masters one step further back into the shadows (Fig 6). At that level of the Cult the Republican and Democrat parties are controlled by the same people and no matter which is in power the Cult is in power. This is how it works in almost every country and certainly in Britain with Conservative, Labour, Liberal Democrat and Green parties now all on the same page whatever the rhetoric may be in their feeble attempts to appear different. Neocons operated at the time of Bush through a think tank called The Project for the New American Century which in September, 2000, published a document entitled *Rebuilding America's Defenses: Strategies, Forces, and Resources*

For a New Century demanding that America fight 'multiple, simultaneous major theatre wars' as a 'core mission' to force regime-change in countries including Iraq, Libya and Syria. Neocons arranged for Bush ('Republican') and Blair ('Labour Party') to front-up the invasion of Iraq and when they departed the Democons orchestrated the targeting of Libya and Syria through Barack Obama ('Democrat') and British Prime Minister David Cameron ('Conservative Party'). We have 'different' parties and 'different' people, but the same unfolding script. The more the Cult has seized the reigns of parties and personnel the more their policies have transparently pursued the same agenda to the point where the fascist 'Covid' impositions of the Conservative junta of Jackboot Johnson in Britain were opposed by the Labour Party because they were not fascist enough. The Labour Party is likened to the US Democrats while the Conservative Party is akin to a British version of the Republicans and on both sides of the Atlantic they all speak the same language and support the direction demanded by the Cult although some more enthusiastically than others. It's a similar story in country after country because it's all centrally controlled. Oh, but what about Trump? I'll come to him shortly. Political 'choice' in the 'party' system goes like this: You vote for Party A and they get into government. You don't like what they do so next time you vote for Party B and they get into government. You don't like what they do when it's pretty much the same as Party A and why wouldn't that be with both controlled by the same force? Given that only two, sometimes three, parties have any chance of forming a government to get rid of Party B that you don't like you have to vote again for Party A which … you don't like. This, ladies and gentlemen, is what they call 'democracy' which we are told – wrongly – is a term interchangeable with 'freedom'.

The cult of cults

At this point I need to introduce a major expression of the Global Cult known as Sabbatian-Frankism. Sabbatian is also spelt as Sabbatean. I will summarise here. I have published major exposés

and detailed background in other works. Sabbatian-Frankism combines the names of two frauds posing as 'Jewish' men, Sabbatai Zevi (1626-1676), a rabbi, black magician and occultist who proclaimed he was the Jewish messiah; and Jacob Frank (1726-1791), the Polish 'Jew', black magician and occultist who said he was the reincarnation of 'messiah' Zevi and biblical patriarch Jacob. They worked across two centuries to establish the Sabbatian-Frankist cult that plays a major, indeed central, role in the manipulation of human society by the Global Cult which has its origins much further back in history than Sabbatai Zevi. I should emphasise two points here in response to the shrill voices that will scream 'anti-Semitism': (1) Sabbatian-Frankists are NOT Jewish and only pose as such to hide their cult behind a Jewish façade; and (2) my information about this cult has come from Jewish sources who have long realised that their society and community has been infiltrated and taken over by interloper Sabbatian-Frankists. Infiltration has been the foundation technique of Sabbatian-Frankism from its official origin in the 17th century. Zevi's Sabbatian sect attracted a massive following described as the biggest messianic movement in Jewish history, spreading as far as Africa and Asia, and he promised a return for the Jews to the 'Promised Land' of Israel. Sabbatianism was not Judaism but an inversion of everything that mainstream Judaism stood for. So much so that this sinister cult would have a feast day when Judaism had a fast day and whatever was forbidden in Judaism the Sabbatians were encouraged and even commanded to do. This included incest and what would be today called Satanism. Members were forbidden to marry outside the sect and there was a system of keeping their children ignorant of what they were part of until they were old enough to be trusted not to unknowingly reveal anything to outsiders. The same system is employed to this day by the Global Cult in general which Sabbatian-Frankism has enormously influenced and now largely controls.

Zevi and his Sabbatians suffered a setback with the intervention by the Sultan of the Islamic Ottoman Empire in the Middle East and what is now the Republic of Turkey where Zevi was located. The

Sultan gave him the choice of proving his 'divinity', converting to Islam or facing torture and death. Funnily enough Zevi chose to convert or at least appear to. Some of his supporters were disillusioned and drifted away, but many did not with 300 families also converting – only in theory – to Islam. They continued behind this Islamic smokescreen to follow the goals, rules and rituals of Sabbatianism and became known as 'crypto-Jews' or the 'Dönmeh' which means 'to turn'. This is rather ironic because they didn't 'turn' and instead hid behind a fake Islamic persona. The process of appearing to be one thing while being very much another would become the calling card of Sabbatianism especially after Zevi's death and the arrival of the Satanist Jacob Frank in the 18th century when the cult became Sabbatian-Frankism and plumbed still new depths of depravity and infiltration which included – still includes – human sacrifice and sex with children. Wherever Sabbatians go paedophilia and Satanism follow and is it really a surprise that Hollywood is so infested with child abuse and Satanism when it was established by Sabbatian-Frankists and is still controlled by them? Hollywood has been one of the prime vehicles for global perceptual programming and manipulation. How many believe the version of 'history' portrayed in movies when it is a travesty and inversion (again) of the truth? Rabbi Marvin Antelman describes Frankism in his book, *To Eliminate the Opiate*, as 'a movement of complete evil' while Jewish professor Gershom Scholem said of Frank in *The Messianic Idea in Judaism*: 'In all his actions [he was] a truly corrupt and degenerate individual ... one of the most frightening phenomena in the whole of Jewish history.' Frank was excommunicated by traditional rabbis, as was Zevi, but Frank was undeterred and enjoyed vital support from the House of Rothschild, the infamous banking dynasty whose inner-core are Sabbatian-Frankists and not Jews. Infiltration of the Roman Church and Vatican was instigated by Frank with many Dönmeh 'turning' again to convert to Roman Catholicism with a view to hijacking the reins of power. This was the ever-repeating modus operandi and continues to be so. Pose as an advocate of the religion, culture or country that you want to control and then

manipulate your people into the positions of authority and influence largely as advisers, administrators and Svengalis for those that appear to be in power. They did this with Judaism, Christianity (Christian Zionism is part of this), Islam and other religions and nations until Sabbatian-Frankism spanned the world as it does today.

Sabbatian Saudis and the terror network

One expression of the Sabbatian-Frankist Dönmeh within Islam is the ruling family of Saudi Arabia, the House of Saud, through which came the vile distortion of Islam known as Wahhabism. This is the violent creed followed by terrorist groups like Al-Qaeda and ISIS or Islamic State. Wahhabism is the hand-chopping, head-chopping 'religion' of Saudi Arabia which is used to keep the people in a constant state of fear so the interloper House of Saud can continue to rule. Al-Qaeda and Islamic State were lavishly funded by the House of Saud while being created and directed by the Sabbatian-Frankist network in the United States that operates through the Pentagon, CIA and the government in general of whichever 'party'. The front man for the establishment of Wahhabism in the middle of the 18th century was a Sabbatian-Frankist 'crypto-Jew' posing as Islamic called Muhammad ibn Abd al-Wahhab. His daughter would marry the son of Muhammad bin Saud who established the first Saudi state before his death in 1765 with support from the British Empire. Bin Saud's successors would establish modern Saudi Arabia in league with the British and Americans in 1932 which allowed them to seize control of Islam's major shrines in Mecca and Medina. They have dictated the direction of Sunni Islam ever since while Iran is the major centre of the Shiite version and here we have the source of at least the public conflict between them. The Sabbatian network has used its Wahhabi extremists to carry out Problem-Reaction-Solution terrorist attacks in the name of 'Al-Qaeda' and 'Islamic State' to justify a devastating 'war on terror', ever-increasing surveillance of the population and to terrify people into compliance. Another insight of the Renegade Mind is the streetwise understanding that

just because a country, location or people are attacked doesn't mean that those apparently representing that country, location or people are not behind the attackers. Often they are *orchestrating* the attacks because of the societal changes that can be then justified in the name of 'saving the population from terrorists'.

I show in great detail in *The Trigger* how Sabbatian-Frankists were the real perpetrators of 9/11 and not '19 Arab hijackers' who were blamed for what happened. Observe what was justified in the name of 9/11 alone in terms of Middle East invasions, mass surveillance and control that fulfilled the demands of the Project for the New American Century document published by the Sabbatian Neocons. What appear to be enemies are on the deep inside players on the same Sabbatian team. Israel and Arab 'royal' dictatorships are all ruled by Sabbatians and the recent peace agreements between Israel and Saudi Arabia, the United Arab Emirates (UAE) and others are only making formal what has always been the case behind the scenes. Palestinians who have been subjected to grotesque tyranny since Israel was bombed and terrorised into existence in 1948 have never stood a chance. Sabbatian-Frankists have controlled Israel (so the constant theme of violence and war which Sabbatians love) and they have controlled the Arab countries that Palestinians have looked to for real support that never comes. 'Royal families' of the Arab world in Saudi Arabia, Bahrain, UAE, etc., are all Sabbatians with allegiance to the aims of the cult and not what is best for their Arabic populations. They have stolen the oil and financial resources from their people by false claims to be 'royal dynasties' with a genetic right to rule and by employing vicious militaries to impose their will.

Satanic 'illumination'

The Satanist Jacob Frank formed an alliance in 1773 with two other Sabbatians, Mayer Amschel Rothschild (1744-1812), founder of the Rothschild banking dynasty, and Jesuit-educated fraudulent Jew, Adam Weishaupt, and this led to the formation of the Bavarian Illuminati, firstly under another name, in 1776. The Illuminati would

be the manipulating force behind the French Revolution (1789-1799) and was also involved in the American Revolution (1775-1783) before and after the Illuminati's official creation. Weishaupt would later become (in public) a Protestant Christian in archetypal Sabbatian style. I read that his name can be decoded as Adam-Weishaupt or 'the first man to lead those who know'. He wasn't a leader in the sense that he was a subordinate, but he did lead those below him in a crusade of transforming human society that still continues today. The theme was confirmed as early as 1785 when a horseman courier called Lanz was reported to be struck by lighting and extensive Illuminati documents were found in his saddlebags. They made the link to Weishaupt and detailed the plan for world takeover. Current events with 'Covid' fascism have been in the making for a very long time. Jacob Frank was jailed for 13 years by the Catholic Inquisition after his arrest in 1760 and on his release he headed for Frankfurt, Germany, home city and headquarters of the House of Rothschild where the alliance was struck with Mayer Amschel Rothschild and Weishaupt. Rothschild arranged for Frank to be given the title of Baron and he became a wealthy nobleman with a big following of Jews in Germany, the Austro-Hungarian Empire and other European countries. Most of them would have believed he was on their side.

The name 'Illuminati' came from the Zohar which is a body of works in the Jewish mystical 'bible' called the Kabbalah. 'Zohar' is the foundation of Sabbatian-Frankist belief and in Hebrew 'Zohar' means 'splendour', 'radiance', 'illuminated', and so we have 'Illuminati'. They claim to be the 'Illuminated Ones' from their knowledge systematically hidden from the human population and passed on through generations of carefully-chosen initiates in the global secret society network or Cult. Hidden knowledge includes an awareness of the Cult agenda for the world and the nature of our collective reality that I will explore later. Cult 'illumination' is symbolised by the torch held by the Statue of Liberty which was gifted to New York by French Freemasons in Paris who knew exactly what it represents. 'Liberty' symbolises the goddess worshipped in

Babylon as Queen Semiramis or Ishtar. The significance of this will become clear. Notice again the ubiquitous theme of inversion with the Statue of 'Liberty' really symbolising mass control (Fig 7). A mirror-image statute stands on an island in the River Seine in Paris from where New York Liberty originated (Fig 8). A large replica of the Liberty flame stands on top of the Pont de l'Alma tunnel in Paris where Princess Diana died in a Cult ritual described in *The Biggest Secret*. Lucifer 'the light bringer' is related to all this (and much more as we'll see) and 'Lucifer' is a central figure in Sabbatian-Frankism and its associated Satanism. Sabbatians reject the Jewish Torah, or Pentateuch, the 'five books of Moses' in the Old Testament known as Genesis, Exodus, Leviticus, Numbers, and Deuteronomy which are claimed by Judaism and Christianity to have been dictated by 'God' to Moses on Mount Sinai. Sabbatians say these do not apply to them and they seek to replace them with the Zohar to absorb Judaism and its followers into their inversion which is an expression of a much greater global inversion. They want to delete all religions and force humanity to worship a one-world religion – Sabbatian Satanism that also includes worship of the Earth goddess. Satanic themes are being more and more introduced into mainstream society and while Christianity is currently the foremost target for destruction the others are planned to follow.

Figure 7: The Cult goddess of Babylon disguised as the Statue of Liberty holding the flame of Lucifer the 'light bringer'.

Figure 8: Liberty's mirror image in Paris where the New York version originated.

Marx brothers

Rabbi Marvin Antelman connects the Illuminati to the Jacobins in *To Eliminate the Opiate* and Jacobins were the force behind the French Revolution. He links both to the Bund der Gerechten, or League of the Just, which was the network that inflicted communism/Marxism on the world. Antelman wrote:

> The original inner circle of the Bund der Gerechten consisted of born Catholics, Protestants and Jews [Sabbatian-Frankist infiltrators], and those representatives of respective subdivisions formulated schemes for the ultimate destruction of their faiths. The heretical Catholics laid plans which they felt would take a century or more for the ultimate destruction of the church; the apostate Jews for the ultimate destruction of the Jewish religion.

Sabbatian-created communism connects into this anti-religion agenda in that communism does not allow for the free practice of religion. The Sabbatian 'Bund' became the International Communist Party and Communist League and in 1848 'Marxism' was born with the Communist Manifesto of Sabbatian assets Karl Marx and Friedrich Engels. It is absolutely no coincidence that Marxism, just a different name for fascist and other centrally-controlled tyrannies, is being imposed worldwide as a result of the 'Covid' hoax and nor that Marxist/fascist China was the place where the hoax originated. The reason for this will become very clear in the chapter 'Covid: The calculated catastrophe'. The so-called 'Woke' mentality has hijacked

traditional beliefs of the political left and replaced them with far-right make-believe 'social justice' better known as Marxism. Woke will, however, be swallowed by its own perceived 'revolution' which is really the work of billionaires and billionaire corporations feigning being 'Woke'. Marxism is being touted by Wokers as a replacement for 'capitalism' when we don't have 'capitalism'. We have cartelism in which the market is stitched up by the very Cult billionaires and corporations bankrolling Woke. Billionaires love Marxism which keeps the people in servitude while they control from the top. Terminally naïve Wokers think they are 'changing the world' when it's the Cult that is doing the changing and when they have played their vital part and become surplus to requirements they, too, will be targeted. The Illuminati-Jacobins were behind the period known as 'The Terror' in the French Revolution in 1793 and 1794 when Jacobin Maximillian de Robespierre and his Orwellian 'Committee of Public Safety' killed 17,000 'enemies of the Revolution' who had once been 'friends of the Revolution'. Karl Marx (1818-1883), whose Sabbatian creed of Marxism has cost the lives of at least 100 million people, is a hero once again to Wokers who have been systematically kept ignorant of real history by their 'education' programming. As a result they now promote a Sabbatian 'Marxist' abomination destined at some point to consume them. Rabbi Antelman, who spent decades researching the Sabbatian plot, said of the League of the Just and Karl Marx:

> Contrary to popular opinion Karl Marx did not originate the Communist Manifesto. He was paid for his services by the League of the Just, which was known in its country of origin, Germany, as the Bund der Geaechteten.

Antelman said the text attributed to Marx was the work of other people and Marx 'was only repeating what others already said'. Marx was 'a hired hack – lackey of the wealthy Illuminists'. Marx famously said that religion was the 'opium of the people' (part of the Sabbatian plan to demonise religion) and Antelman called his books, *To Eliminate the Opiate*. Marx was born Jewish, but his family converted to Christianity (Sabbatian modus operandi) and he

attacked Jews, not least in his book, *A World Without Jews*. In doing so he supported the Sabbatian plan to destroy traditional Jewishness and Judaism which we are clearly seeing today with the vindictive targeting of orthodox Jews by the Sabbatian government of Israel over 'Covid' laws. I don't follow any religion and it has done much damage to the world over centuries and acted as a perceptual straightjacket. Renegade Minds, however, are always asking *why* something is being done. It doesn't matter if they agree or disagree with what is happening – *why* is it happening is the question. The 'why?' can be answered with regard to religion in that religions create interacting communities of believers when the Cult wants to dismantle all discourse, unity and interaction (see 'Covid' lockdowns) and the ultimate goal is to delete all religions for a one-world religion of Cult Satanism worshipping their 'god' of which more later. We see the same 'why?' with gun control in America. I don't have guns and don't want them, but why is the Cult seeking to disarm the population at the same time that law enforcement agencies are armed to their molars and why has every tyrant in history sought to disarm people before launching the final takeover? They include Hitler, Stalin, Pol Pot and Mao who followed confiscation with violent seizing of power. You know it's a Cult agenda by the people who immediately race to the microphones to exploit dead people in multiple shootings. Ultra-Zionist Cult lackey Senator Chuck Schumer was straight on the case after ten people were killed in Boulder, Colorado in March, 2121. Simple rule … if Schumer wants it the Cult wants it and the same with his ultra-Zionist mate the wild-eyed Senator Adam Schiff. At the same time they were calling for the disarmament of Americans, many of whom live a long way from a police response, Schumer, Schiff and the rest of these pampered clowns were sitting on Capitol Hill behind a razor-wired security fence protected by thousands of armed troops in addition to their own armed bodyguards. Mom and pop in an isolated home? They're just potential mass shooters.

Zion Mainframe

Sabbatian-Frankists and most importantly the Rothschilds were behind the creation of 'Zionism', a political movement that demanded a Jewish homeland in Israel as promised by Sabbatai Zevi. The very symbol of Israel comes from the German meaning of the name Rothschild. Dynasty founder Mayer Amschel Rothschild changed the family name from Bauer to Rothschild, or 'Red-Shield' in German, in deference to the six-pointed 'Star of David' hexagram displayed on the family's home in Frankfurt. The symbol later appeared on the flag of Israel after the Rothschilds were centrally involved in its creation. Hexagrams are not a uniquely Jewish symbol and are widely used in occult ('hidden') networks often as a symbol for Saturn (see my other books for why). Neither are Zionism and Jewishness interchangeable. Zionism is a political movement and philosophy and not a 'race' or a people. Many Jews oppose Zionism and many non-Jews, including US President Joe Biden, call themselves Zionists as does Israel-centric Donald Trump. America's support for the Israel government is pretty much a gimme with ultra-Zionist billionaires and corporations providing fantastic and dominant funding for both political parties. Former Congresswoman Cynthia McKinney has told how she was approached immediately she ran for office to 'sign the pledge' to Israel and confirm that she would always vote in that country's best interests. All American politicians are approached in this way. Anyone who refuses will get no support or funding from the enormous and all-powerful Zionist lobby that includes organisations like mega-lobby group AIPAC, the American Israel Public Affairs Committee. Trump's biggest funder was ultra-Zionist casino and media billionaire Sheldon Adelson while major funders of the Democratic Party include ultra-Zionist George Soros and ultra-Zionist financial and media mogul, Haim Saban. Some may reel back at the suggestion that Soros is an Israel-firster (Sabbatian-controlled Israel-firster), but Renegade Minds watch the actions not the words and everywhere Soros donates his billions the Sabbatian agenda benefits. In the spirit of Sabbatian inversion Soros pledged $1 billion for a new university network to promote 'liberal values and tackle intolerance'. He made the announcement during his annual speech

at the Cult-owned World Economic Forum in Davos, Switzerland, in January, 2020, after his 'harsh criticism' of 'authoritarian rulers' around the world. You can only laugh at such brazen mendacity. How *he* doesn't laugh is the mystery. Translated from the Orwellian 'liberal values and tackle intolerance' means teaching non-white people to hate white people and for white people to loathe themselves for being born white. The reason for that will become clear.

The 'Anti-Semitism' fraud

Zionists support the Jewish homeland in the land of Palestine which has been the Sabbatian-Rothschild goal for so long, but not for the benefit of Jews. Sabbatians and their global Anti-Semitism Industry have skewed public and political opinion to equate opposing the violent extremes of Zionism to be a blanket attack and condemnation of all Jewish people. Sabbatians and their global Anti-Semitism Industry have skewed public and political opinion to equate opposing the violent extremes of Zionism to be a blanket attack and condemnation of all Jewish people. This is nothing more than a Sabbatian protection racket to stop legitimate investigation and exposure of their agendas and activities. The official definition of 'anti-Semitism' has more recently been expanded to include criticism of Zionism – a *political movement* – and this was done to further stop exposure of Sabbatian infiltrators who created Zionism as we know it today in the 19th century. Renegade Minds will talk about these subjects when they know the shit that will come their way. People must decide if they want to know the truth or just cower in the corner in fear of what others will say. Sabbatians have been trying to label me as 'anti-Semitic' since the 1990s as I have uncovered more and more about their background and agendas. Useless, gutless, fraudulent 'journalists' then just repeat the smears without question and on the day I was writing this section a pair of unquestioning repeaters called Ben Quinn and Archie Bland (how appropriate) outright called me an 'anti-Semite' in the establishment propaganda sheet, the London *Guardian*, with no supporting evidence. The

Sabbatian Anti-Semitism Industry said so and who are they to question that? They wouldn't dare. Ironically 'Semitic' refers to a group of languages in the Middle East that are almost entirely Arabic. 'Anti-Semitism' becomes 'anti-Arab' which if the consequences of this misunderstanding were not so grave would be hilarious. Don't bother telling Quinn and Bland. I don't want to confuse them, bless 'em. One reason I am dubbed 'anti-Semitic' is that I wrote in the 1990s that Jewish operatives (Sabbatians) were heavily involved in the Russian Revolution when Sabbatians overthrew the Romanov dynasty. This apparently made me 'anti-Semitic'. Oh, really? Here is a section from *The Trigger*:

British journalist Robert Wilton confirmed these themes in his 1920 book *The Last Days of the Romanovs* when he studied official documents from the Russian government to identify the members of the Bolshevik ruling elite between 1917 and 1919. The Central Committee included 41 Jews among 62 members; the Council of the People's Commissars had 17 Jews out of 22 members; and 458 of the 556 most important Bolshevik positions between 1918 and 1919 were occupied by Jewish people. Only 17 were Russian. Then there were the 23 Jews among the 36 members of the vicious Cheka Soviet secret police established in 1917 who would soon appear all across the country.

Professor Robert Service of Oxford University, an expert on 20th century Russian history, found evidence that ['Jewish'] Leon Trotsky had sought to make sure that Jews were enrolled in the Red Army and were disproportionately represented in the Soviet civil bureaucracy that included the Cheka which performed mass arrests, imprisonment and executions of 'enemies of the people'. A US State Department Decimal File (861.00/5339) dated November 13th, 1918, names [Rothschild banking agent in America] Jacob Schiff and a list of ultra-Zionists as funders of the Russian Revolution leading to claims of a 'Jewish plot', but the key point missed by all is they were not 'Jews' – they were Sabbatian-Frankists.

Britain's Winston Churchill made the same error by mistake or otherwise. He wrote in a 1920 edition of the *Illustrated Sunday Herald* that those behind the Russian revolution were part of a 'worldwide conspiracy for the overthrow of civilisation and for the reconstitution of society on the basis of arrested development, of envious malevolence, and impossible equality' (see 'Woke' today because that has been created by the same network). Churchill said there was no need to exaggerate the part played in the creation of Bolshevism and in the actual bringing about of the Russian

Revolution 'by these international and for the most part atheistical Jews' ['atheistical Jews' = Sabbatians]. Churchill said it is certainly a very great one and probably outweighs all others: 'With the notable exception of Lenin, the majority of the leading figures are Jews.' He went on to describe, knowingly or not, the Sabbatian modus operandi of placing puppet leaders nominally in power while they control from the background:

> Moreover, the principal inspiration and driving power comes from the Jewish leaders. Thus Tchitcherin, a pure Russian, is eclipsed by his nominal subordinate, Litvinoff, and the influence of Russians like Bukharin or Lunacharski cannot be compared with the power of Trotsky, or of Zinovieff, the Dictator of the Red Citadel (Petrograd), or of Krassin or Radek – all Jews. In the Soviet institutions the predominance of Jews is even more astonishing. And the prominent, if not indeed the principal, part in the system of terrorism applied by the Extraordinary Commissions for Combatting Counter-Revolution has been taken by Jews, and in some notable cases by Jewesses.

What I said about seriously disproportionate involvement in the Russian Revolution by Jewish 'revolutionaries' (Sabbatians) is provable fact, but truth is no defence against the Sabbatian Anti-Semitism Industry, its repeater parrots like Quinn and Bland, and the now breathtaking network of so-called 'Woke' 'anti-hate' groups with interlocking leaderships and funding which have the role of discrediting and silencing anyone who gets too close to exposing the Sabbatians. We have seen 'truth is no defence' confirmed in legal judgements with the Saskatchewan Human Rights Commission in Canada decreeing this: 'Truthful statements can be presented in a manner that would meet the definition of hate speech, and not all truthful statements must be free from restriction.' Most 'anti-hate' activists, who are themselves consumed by hatred, are too stupid and ignorant of the world to know how they are being used. They are far too far up their own virtue-signalling arses and it's far too dark for them to see anything.

The 'revolution' game

The background and methods of the 'Russian' Revolution are straight from the Sabbatian playbook seen in the French Revolution

and endless others around the world that appear to start as a revolution of the people against tyrannical rule and end up with a regime change to more tyrannical rule overtly or covertly. Wars, terror attacks and regime overthrows follow the Sabbatian cult through history with its agents creating them as Problem-Reaction-Solutions to remove opposition on the road to world domination. Sabbatian dots connect the Rothschilds with the Illuminati, Jacobins of the French Revolution, the 'Bund' or League of the Just, the International Communist Party, Communist League and the Communist Manifesto of Karl Marx and Friedrich Engels that would lead to the Rothschild-funded Russian Revolution. The sequence comes under the heading of 'creative destruction' when you advance to your global goal by continually destroying the status quo to install a new status quo which you then also destroy. The two world wars come to mind. With each new status quo you move closer to your planned outcome. Wars and mass murder are to Sabbatians a collective blood sacrifice ritual. They are obsessed with death for many reasons and one is that death is an inversion of life. Satanists and Sabbatians are obsessed with death and often target churches and churchyards for their rituals. Inversion-obsessed Sabbatians explain the use of inverted symbolism including the *inverted* pentagram and *inverted* cross. The inversion of the cross has been related to targeting Christianity, but the cross was a religious symbol long before Christianity and its inversion is a statement about the Sabbatian mentality and goals more than any single religion.

Sabbatians operating in Germany were behind the rise of the occult-obsessed Nazis and the subsequent Jewish exodus from Germany and Europe to Palestine and the United States after World War Two. The Rothschild dynasty was at the forefront of this both as political manipulators and by funding the operation. Why would Sabbatians help to orchestrate the horrors inflicted on Jews by the Nazis and by Stalin after they organised the Russian Revolution? Sabbatians hate Jews and their religion, that's why. They pose as Jews and secure positions of control within Jewish society and play the 'anti-Semitism' card to protect themselves from exposure

through a global network of organisations answering to the Sabbatian-created-and-controlled globe-spanning intelligence network that involves a stunning web of military-intelligence operatives and operations for a tiny country of just nine million. Among them are Jewish assets who are not Sabbatians but have been convinced by them that what they are doing is for the good of Israel and the Jewish community to protect them from what they have been programmed since childhood to believe is a Jew-hating hostile world. The Jewish community is just a highly convenient cover to hide the true nature of Sabbatians. Anyone getting close to exposing their game is accused by Sabbatian place-people and gofers of 'anti-Semitism' and claiming that all Jews are part of a plot to take over the world. I am not saying that. I am saying that Sabbatians – the *real* Jew-haters – have infiltrated the Jewish community to use them both as a cover and an 'anti-Semitic' defence against exposure. Thus we have the Anti-Semitism Industry targeted researchers in this way and most Jewish people think this is justified and genuine. They don't know that their 'Jewish' leaders and institutions of state, intelligence and military are not controlled by Jews at all, but cultists and stooges of Sabbatian-Frankism. I once added my name to a pro-Jewish freedom petition online and the next time I looked my name was gone and text had been added to the petition blurb to attack me as an 'anti-Semite' such is the scale of perceptual programming.

Moving on America

I tell the story in *The Trigger* and a chapter called 'Atlantic Crossing' how particularly after Israel was established the Sabbatians moved in on the United States and eventually grasped control of government administration, the political system via both Democrats and Republicans, the intelligence community like the CIA and National Security Agency (NSA), the Pentagon and mass media. Through this seriously compartmentalised network Sabbatians and their operatives in Mossad, Israeli Defense Forces (IDF) and US agencies pulled off 9/11 and blamed it on 19 'Al-Qaeda hijackers' dominated by men from, or connected to, Sabbatian-ruled Saudi

Arabia. The '19' were not even on the planes let alone flew those big passenger jets into buildings while being largely incompetent at piloting one-engine light aircraft. 'Hijacker' Hani Hanjour who is said to have flown American Airlines Flight 77 into the Pentagon with a turn and manoeuvre most professional pilots said they would have struggled to do was banned from renting a small plane by instructors at the Freeway Airport in Bowie, Maryland, just *six weeks* earlier on the grounds that he was an incompetent pilot. The Jewish population of the world is just 0.2 percent with even that almost entirely concentrated in Israel (75 percent Jewish) and the United States (around two percent). This two percent and globally 0.2 percent refers to *Jewish* people and not Sabbatian interlopers who are a fraction of that fraction. What a sobering thought when you think of the fantastic influence on world affairs of tiny Israel and that the Project for the New America Century (PNAC) which laid out the blueprint in September, 2000, for America's war on terror and regime change wars in Iraq, Libya and Syria was founded and dominated by Sabbatians known as 'Neocons'. The document conceded that this plan would not be supported politically or publicly without a major attack on American soil and a Problem-Reaction-Solution excuse to send troops to war across the Middle East. Sabbatian Neocons said:

> ... [The] process of transformation ... [war and regime change] ... is likely to be a long one, absent some catastrophic and catalysing event – like a new Pearl Harbor.

Four months later many of those who produced that document came to power with their inane puppet George Bush from the long-time Sabbatian Bush family. They included Sabbatian Dick Cheney who was officially vice-president, but really de-facto president for the entirety of the 'Bush' government. Nine months after the 'Bush' inauguration came what Bush called at the time 'the Pearl Harbor of the 21st century' and with typical Sabbatian timing and symbolism 2001 was the 60th anniversary of the attack in 1941 by the Japanese Air Force on Pearl Harbor, Hawaii, which allowed President Franklin Delano Roosevelt to take the United States into a Sabbatian-

instigated Second World War that he said in his election campaign that he never would. The evidence is overwhelming that Roosevelt and his military and intelligence networks knew the attack was coming and did nothing to stop it, but they did make sure that America's most essential naval ships were not in Hawaii at the time. Three thousand Americans died in the Pearl Harbor attacks as they did on September 11th. By the 9/11 year of 2001 Sabbatians had widely infiltrated the US government, military and intelligence operations and used their compartmentalised assets to pull off the 'Al-Qaeda' attacks. If you read *The Trigger* it will blow your mind to see the utterly staggering concentration of 'Jewish' operatives (Sabbatian infiltrators) in essential positions of political, security, legal, law enforcement, financial and business power before, during, and after the attacks to make them happen, carry them out, and then cover their tracks – and I do mean *staggering* when you think of that 0.2 percent of the world population and two percent of Americans which are Jewish while Sabbatian infiltrators are a fraction of that. A central foundation of the 9/11 conspiracy was the hijacking of government, military, Air Force and intelligence computer systems in real time through 'back-door' access made possible by Israeli (Sabbatian) 'cyber security' software. Sabbatian-controlled Israel is on the way to rivalling Silicon Valley for domination of cyberspace and is becoming the dominant force in cyber-security which gives them access to entire computer systems and their passcodes across the world. Then add to this that Zionists head (officially) Silicon Valley giants like Google (Larry Page and Sergey Brin), Google-owned YouTube (Susan Wojcicki), Facebook (Mark Zuckerberg and Sheryl Sandberg), and Apple (Chairman Arthur D. Levinson), and that ultra-Zionist hedge fund billionaire Paul Singer has a $1 billion stake in Twitter which is only nominally headed by 'CEO' pothead Jack Dorsey. As cable news host Tucker Carlson said of Dorsey: 'There used to be debate in the medical community whether dropping a ton of acid had permanent effects and I think that debate has now ended.' Carlson made the comment after Dorsey told a hearing on Capitol Hill (if you cut through his bullshit) that he

believed in free speech so long as he got to decide what you can hear and see. These 'big names' of Silicon Valley are only front men and women for the Global Cult, not least the Sabbatians, who are the true controllers of these corporations. Does anyone still wonder why these same people and companies have been ferociously censoring and banning people (like me) for exposing any aspect of the Cult agenda and especially the truth about the 'Covid' hoax which Sabbatians have orchestrated?

The Jeffrey Epstein paedophile ring was a Sabbatian operation. He was officially 'Jewish' but he was a Sabbatian and women abused by the ring have told me about the high number of 'Jewish' people involved. The Epstein horror has Sabbatian written all over it and matches perfectly their modus operandi and obsession with sex and ritual. Epstein was running a Sabbatian blackmail ring in which famous people with political and other influence were provided with young girls for sex while everything was being filmed and recorded on hidden cameras and microphones at his New York house, Caribbean island and other properties. Epstein survivors have described this surveillance system to me and some have gone public. Once the famous politician or other figure knew he or she was on video they tended to do whatever they were told. Here we go again …when you've got them by the balls their hearts and minds will follow. Sabbatians use this blackmail technique on a wide scale across the world to entrap politicians and others they need to act as demanded. Epstein's private plane, the infamous 'Lolita Express', had many well-known passengers including Bill Clinton while Bill Gates has flown on an Epstein plane and met with him four years after Epstein had been jailed for paedophilia. They subsequently met many times at Epstein's home in New York according to a witness who was there. Epstein's infamous side-kick was Ghislaine Maxwell, daughter of Mossad agent and ultra-Zionist mega-crooked British businessman, Bob Maxwell, who at one time owned the *Daily Mirror* newspaper. Maxwell was murdered at sea on his boat in 1991 by Sabbatian-controlled Mossad when he became a liability with his

business empire collapsing as a former Mossad operative has confirmed (see *The Trigger*).

Money, money, money, funny money …

Before I come to the Sabbatian connection with the last three US presidents I will lay out the crucial importance to Sabbatians of controlling banking and finance. Sabbatian Mayer Amschel Rothschild set out to dominate this arena in his family's quest for total global control. What is freedom? It is, in effect, choice. The more choices you have the freer you are and the fewer your choices the more you are enslaved. In the global structure created over centuries by Sabbatians the biggest decider and restrictor of choice is … money. Across the world if you ask people what they would like to do with their lives and why they are not doing that they will reply 'I don't have the money'. This is the idea. A global elite of multi-billionaires are described as 'greedy' and that is true on one level; but control of money – who has it and who doesn't – is not primarily about greed. It's about control. Sabbatians have seized ever more control of finance and sucked the wealth of the world out of the hands of the population. We talk now, after all, about the 'One-percent' and even then the wealthiest are a lot fewer even than that. This has been made possible by a money scam so outrageous and so vast it could rightly be called the scam of scams founded on creating 'money' out of nothing and 'loaning' that with interest to the population. Money out of nothing is called 'credit'. Sabbatians have asserted control over governments and banking ever more completely through the centuries and secured financial laws that allow banks to lend hugely more than they have on deposit in a confidence trick known as fractional reserve lending. Imagine if you could lend money that doesn't exist and charge the recipient interest for doing so. You would end up in jail. Bankers by contrast end up in mansions, private jets, Malibu and Monaco.

Banks are only required to keep a fraction of their deposits and wealth in their vaults and they are allowed to lend 'money' they don't have called 'credit. Go into a bank for a loan and if you succeed

the banker will not move any real wealth into your account. They will type into your account the amount of the agreed 'loan' – say £100,000. This is not wealth that really exists; it is non-existent, fresh-air, created-out-of-nothing 'credit' which has never, does not, and will never exist except in theory. Credit is backed by nothing except wind and only has buying power because people think that it has buying power and accept it in return for property, goods and services. I have described this situation as like those cartoon characters you see chasing each other and when they run over the edge of a cliff they keep running forward on fresh air until one of them looks down, realises what's happened, and they all crash into the ravine. The whole foundation of the Sabbatian financial system is to stop people looking down except for periodic moments when they want to crash the system (as in 2008 and 2020 ongoing) and reap the rewards from all the property, businesses and wealth their borrowers had signed over as 'collateral' in return for a 'loan' of fresh air. Most people think that money is somehow created by governments when it comes into existence from the start as a debt through banks 'lending' illusory money called credit. Yes, the very currency of exchange is a *debt* from day one issued as an interest-bearing loan. Why don't governments create money interest-free and lend it to their people interest-free? Governments are controlled by Sabbatians and the financial system is controlled by Sabbatians for whom interest-free money would be a nightmare come true. Sabbatians underpin their financial domination through their global network of central banks, including the privately-owned US Federal Reserve and Britain's Bank of England, and this is orchestrated by a privately-owned central bank coordination body called the Bank for International Settlements in Basle, Switzerland, created by the usual suspects including the Rockefellers and Rothschilds. Central bank chiefs don't answer to governments or the people. They answer to the Bank for International Settlements or, in other words, the Global Cult which is dominated today by Sabbatians.

Built-in disaster

There are so many constituent scams within the overall banking scam. When you take out a loan of thin-air credit only the amount of that loan is theoretically brought into circulation to add to the amount in circulation; but you are paying back the principle plus interest. The additional interest is not created and this means that with every 'loan' there is a shortfall in the money in circulation between what is borrowed and what has to be paid back. There is never even close to enough money in circulation to repay all outstanding public and private debt including interest. Coldly weaved in the very fabric of the system is the certainty that some will lose their homes, businesses and possessions to the banking 'lender'. This is less obvious in times of 'boom' when the amount of money in circulation (and the debt) is expanding through more people wanting and getting loans. When a downturn comes and the money supply contracts it becomes painfully obvious that there is not enough money to service all debt and interest. This is less obvious in times of 'boom' when the amount of money in circulation (and the debt) is expanding through more people wanting and getting loans. When a downturn comes and the money supply contracts and it becomes painfully obvious – as in 2008 and currently – that there is not enough money to service all debt and interest. Sabbatian banksters have been leading the human population through a calculated series of booms (more debt incurred) and busts (when the debt can't be repaid and the banks get the debtor's tangible wealth in exchange for non-existent 'credit'). With each 'bust' Sabbatian bankers have absorbed more of the world's tangible wealth and we end up with the One-percent. Governments are in bankruptcy levels of debt to the same system and are therefore owned by a system they do not control. The Federal Reserve, 'America's central bank', is privately-owned and American presidents only nominally appoint its chairman or woman to maintain the illusion that it's an arm of government. It's not. The 'Fed' is a cartel of private banks which handed billions to its associates and friends after the crash of 2008 and has been Sabbatian-controlled since it was manipulated into being in 1913 through the covert trickery of Rothschild banking agents Jacob Schiff and Paul

Warburg, and the Sabbatian Rockefeller family. Somehow from a Jewish population of two-percent and globally 0.2 percent (Sabbatian interlopers remember are far smaller) ultra-Zionists headed the Federal Reserve for 31 years between 1987 and 2018 in the form of Alan Greenspan, Bernard Bernanke and Janet Yellen (now Biden's Treasury Secretary) with Yellen's deputy chairman a Israeli-American duel citizen and ultra-Zionist Stanley Fischer, a former governor of the Bank of Israel. Ultra-Zionist Fed chiefs spanned the presidencies of Ronald Reagan ('Republican'), Father George Bush ('Republican'), Bill Clinton ('Democrat'), Boy George Bush ('Republican') and Barack Obama ('Democrat'). We should really add the pre-Greenspan chairman, Paul Adolph Volcker, 'appointed' by Jimmy Carter ('Democrat') who ran the Fed between 1979 and 1987 during the Carter and Reagan administrations before Greenspan took over. Volcker was a long-time associate and business partner of the Rothschilds. No matter what the 'party' officially in power the United States economy was directed by the same force. Here are members of the Obama, Trump and Biden administrations and see if you can make out a common theme.

Barack Obama ('Democrat')

Ultra-Zionists Robert Rubin, Larry Summers, and Timothy Geithner ran the US Treasury in the Clinton administration and two of them reappeared with Obama. Ultra-Zionist Fed chairman Alan Greenspan had manipulated the crash of 2008 through deregulation and jumped ship just before the disaster to make way for ultra-Zionist Bernard Bernanke to hand out trillions to Sabbatian 'too big to fail' banks and businesses, including the ubiquitous ultra-Zionist Goldman Sachs which has an ongoing staff revolving door operation between itself and major financial positions in government worldwide. Obama inherited the fallout of the crash when he took office in January, 2009, and fortunately he had the support of his ultra-Zionist White House Chief of Staff Rahm Emmanuel, son of a terrorist who helped to bomb Israel into being in 1948, and his ultra-Zionist senior adviser David Axelrod, chief strategist in Obama's two

successful presidential campaigns. Emmanuel, later mayor of Chicago and former senior fundraiser and strategist for Bill Clinton, is an example of the Sabbatian policy after Israel was established of migrating insider families to America so their children would be born American citizens. 'Obama' chose this financial team throughout his administration to respond to the Sabbatian-instigated crisis:

Timothy Geithner (ultra-Zionist) Treasury Secretary; Jacob J. Lew, Treasury Secretary; Larry Summers (ultra-Zionist), director of the White House National Economic Council; Paul Adolph Volcker (Rothschild business partner), chairman of the Economic Recovery Advisory Board; Peter Orszag (ultra-Zionist), director of the Office of Management and Budget overseeing all government spending; Penny Pritzker (ultra-Zionist), Commerce Secretary; Jared Bernstein (ultra-Zionist), chief economist and economic policy adviser to Vice President Joe Biden; Mary Schapiro (ultra-Zionist), chair of the Securities and Exchange Commission (SEC); Gary Gensler (ultra-Zionist), chairman of the Commodity Futures Trading Commission (CFTC); Sheila Bair (ultra-Zionist), chair of the Federal Deposit Insurance Corporation (FDIC); Karen Mills (ultra-Zionist), head of the Small Business Administration (SBA); Kenneth Feinberg (ultra-Zionist), Special Master for Executive [bail-out] Compensation. Feinberg would be appointed to oversee compensation (with strings) to 9/11 victims and families in a campaign to stop them having their day in court to question the official story. At the same time ultra-Zionist Bernard Bernanke was chairman of the Federal Reserve and these are only some of the ultra-Zionists with allegiance to Sabbatian-controlled Israel in the Obama government. Obama's biggest corporate donor was ultra-Zionist Goldman Sachs which had employed many in his administration.

Donald Trump ('Republican')

Trump claimed to be an outsider (he wasn't) who had come to 'drain the swamp'. He embarked on this goal by immediately appointing ultra-Zionist Steve Mnuchin, a Goldman Sachs employee for 17

years, as his Treasury Secretary. Others included Gary Cohn (ultra-Zionist), chief operating officer of Goldman Sachs, his first Director of the National Economic Council and chief economic adviser, who was later replaced by Larry Kudlow (ultra-Zionist). Trump's senior adviser throughout his four years in the White House was his sinister son-in-law Jared Kushner, a life-long friend of Israel Prime Minister Benjamin Netanyahu. Kushner is the son of a convicted crook who was pardoned by Trump in his last days in office. Other ultra-Zionists in the Trump administration included: Stephen Miller, Senior Policy Adviser; Avrahm Berkowitz, Deputy Adviser to Trump and his Senior Adviser Jared Kushner; Ivanka Trump, Adviser to the President, who converted to Judaism when she married Jared Kushner; David Friedman, Trump lawyer and Ambassador to Israel; Jason Greenblatt, Trump Organization executive vice president and chief legal officer, who was made Special Representative for International Negotiations and the Israeli-Palestinian Conflict; Rod Rosenstein, Deputy Attorney General; Elliot Abrams, Special Representative for Venezuela, then Iran; John Eisenberg, National Security Council Legal Adviser and Deputy Council to the President for National Security Affairs; Anne Neuberger, Deputy National Manager, National Security Agency; Ezra Cohen-Watnick, Acting Under Secretary of Defense for Intelligence; Elan Carr, Special Envoy to monitor and combat anti-Semitism; Len Khodorkovsky, Deputy Special Envoy to monitor and combat anti-Semitism; Reed Cordish, Assistant to the President, Intragovernmental and Technology Initiatives. Trump Vice President Mike Pence and Secretary of State Mike Pompeo, both Christian Zionists, were also vehement supporters of Israel and its goals and ambitions.

Donald 'free-speech believer' Trump pardoned a number of financial and violent criminals while ignoring calls to pardon Julian Assange and Edward Snowden whose crimes are revealing highly relevant information about government manipulation and corruption and the widespread illegal surveillance of the American people by US 'security' agencies. It's so good to know that Trump is on the side of freedom and justice and not mega-criminals with

allegiance to Sabbatian-controlled Israel. These included a pardon for Israeli spy Jonathan Pollard who was jailed for life in 1987 under the Espionage Act. Aviem Sella, the Mossad agent who recruited Pollard, was also pardoned by Trump while Assange sat in jail and Snowden remained in exile in Russia. Sella had 'fled' (was helped to escape) to Israel in 1987 and was never extradited despite being charged under the Espionage Act. A Trump White House statement said that Sella's clemency had been 'supported by Benjamin Netanyahu, Ron Dermer, Israel's US Ambassador, David Friedman, US Ambassador to Israel and Miriam Adelson, wife of leading Trump donor Sheldon Adelson who died shortly before. Other friends of Jared Kushner were pardoned along with Sholom Weiss who was believed to be serving the longest-ever white-collar prison sentence of more than 800 years in 2000. The sentence was commuted of Ponzi-schemer Eliyahu Weinstein who defrauded Jews and others out of $200 million. I did mention that Assange and Snowden were ignored, right? Trump gave Sabbatians almost everything they asked for in military and political support, moving the US Embassy from Tel Aviv to Jerusalem with its critical symbolic and literal implications for Palestinian statehood, and the 'deal of the Century' designed by Jared Kushner and David Friedman which gave the Sabbatian Israeli government the green light to substantially expand its already widespread program of building illegal Jewish-only settlements in the occupied land of the West Bank. This made a two-state 'solution' impossible by seizing all the land of a potential Palestinian homeland and that had been the plan since 1948 and then 1967 when the Arab-controlled Gaza Strip, West Bank, Sinai Peninsula and Syrian Golan Heights were occupied by Israel. All the talks about talks and road maps and delays have been buying time until the West Bank was physically occupied by Israeli real estate. Trump would have to be a monumentally ill-informed idiot not to see that this was the plan he was helping to complete. The Trump administration was in so many ways the Kushner administration which means the Netanyahu administration which means the Sabbatian administration. I understand why many opposing Cult fascism in all its forms gravitated to Trump, but he

was a crucial part of the Sabbatian plan and I will deal with this in the next chapter.

Joe Biden ('Democrat')

A barely cognitive Joe Biden took over the presidency in January, 2021, along with his fellow empty shell, Vice-President Kamala Harris, as the latest Sabbatian gofers to enter the White House. Names on the door may have changed and the 'party' – the force behind them remained the same as Zionists were appointed to a stream of pivotal areas relating to Sabbatian plans and policy. They included: Janet Yellen, Treasury Secretary, former head of the Federal Reserve, and still another ultra-Zionist running the US Treasury after Mnuchin (Trump), Lew and Geithner (Obama), and Summers and Rubin (Clinton); Anthony Blinken, Secretary of State; Wendy Sherman, Deputy Secretary of State (so that's 'Biden's' Sabbatian foreign policy sorted); Jeff Zients, White House coronavirus coordinator; Rochelle Walensky, head of the Centers for Disease Control; Rachel Levine, transgender deputy health secretary (that's 'Covid' hoax policy under control); Merrick Garland, Attorney General; Alejandro Mayorkas, Secretary of Homeland Security; Cass Sunstein, Homeland Security with responsibility for new immigration laws; Avril Haines, Director of National Intelligence; Anne Neuberger, National Security Agency cybersecurity director (note, cybersecurity); David Cohen, CIA Deputy Director; Ronald Klain, Biden's Chief of Staff (see Rahm Emanuel); Eric Lander, a 'leading geneticist', Office of Science and Technology Policy director (see Smart Grid, synthetic biology agenda); Jessica Rosenworcel, acting head of the Federal Communications Commission (FCC) which controls Smart Grid technology policy and electromagnetic communication systems including 5G. How can it be that so many pivotal positions are held by two-percent of the American population and 0.2 percent of the world population administration after administration no matter who is the president and what is the party? It's a coincidence? Of course it's not and this is why Sabbatians have built their colossal global web of interlocking 'anti-

hate' hate groups to condemn anyone who asks these glaring questions as an 'anti-Semite'. The way that Jewish people horrifically abused in Sabbatian-backed Nazi Germany are exploited to this end is stomach-turning and disgusting beyond words.

Political fusion

Sabbatian manipulation has reversed the roles of Republicans and Democrats and the same has happened in Britain with the Conservative and Labour Parties. Republicans and Conservatives were always labelled the 'right' and Democrats and Labour the 'left', but look at the policy positions now and the Democrat-Labour 'left' has moved further to the 'right' than Republicans and Conservatives under the banner of 'Woke', the Cult-created far-right tyranny. Where once the Democrat-Labour 'left' defended free speech and human rights they now seek to delete them and as I said earlier despite the 'Covid' fascism of the Jackboot Johnson Conservative government in the UK the Labour Party of leader Keir Starmer demanded even more extreme measures. The Labour Party has been very publicly absorbed by Sabbatians after a political and media onslaught against the previous leader, the weak and inept Jeremy Corbyn, over made-up allegations of 'anti-Semitism' both by him and his party. The plan was clear with this 'anti-Semite' propaganda and what was required in response was a swift and decisive 'fuck off' from Corbyn and a statement to expose the Anti-Semitism Industry (Sabbatian) attempt to silence Labour criticism of the Israeli government (Sabbatians) and purge the party of all dissent against the extremes of ultra-Zionism (Sabbatians). Instead Corbyn and his party fell to their knees and appeased the abusers which, by definition, is impossible. Appeasing one demand leads only to a new demand to be appeased until takeover is complete. Like I say – 'fuck off' would have been a much more effective policy and I have used it myself with great effect over the years when Sabbatians are on my case which is most of the time. I consider that fact a great compliment, by the way. The outcome of the Labour Party capitulation is that we now have a Sabbatian-controlled

Conservative Party 'opposed' by a Sabbatian-controlled Labour Party in a one-party Sabbatian state that hurtles towards the extremes of tyranny (the Sabbatian cult agenda). In America the situation is the same. Labour's Keir Starmer spends his days on his knees with his tongue out pointing to Tel Aviv, or I guess now Jerusalem, while Boris Johnson has an 'anti-Semitism czar' in the form of former Labour MP John Mann who keeps Starmer company on his prayer mat.

Sabbatian influence can be seen in Jewish members of the Labour Party who have been ejected for criticism of Israel including those from families that suffered in Nazi Germany. Sabbatians despise real Jewish people and target them even more harshly because it is so much more difficult to dub them 'anti-Semitic' although in their desperation they do try.

CHAPTER THREE

The Pushbacker sting

Until you realize how easy it is for your mind to be manipulated, you remain the puppet of someone else's game
Evita Ochel

I will use the presidencies of Trump and Biden to show how the manipulation of the one-party state plays out behind the illusion of political choice across the world. No two presidencies could – on the face of it – be more different and apparently at odds in terms of direction and policy.

A Renegade Mind sees beyond the obvious and focuses on outcomes and consequences and not image, words and waffle. The Cult embarked on a campaign to divide America between those who blindly support its agenda (the mentality known as 'Woke') and those who are pushing back on where the Cult and its Sabbatians want to go. This presents infinite possibilities for dividing and ruling the population by setting them at war with each other and allows a perceptual ring fence of demonisation to encircle the Pushbackers in a modern version of the Little Big Horn in 1876 when American cavalry led by Lieutenant Colonel George Custer were drawn into a trap, surrounded and killed by Native American tribes defending their land of thousands of years from being seized by the government. In this modern version the roles are reversed and it's those defending themselves from the Sabbatian government who are surrounded and the government that's seeking to destroy them. This trap was set years ago and to explain how we must return to 2016

and the emergence of Donald Trump as a candidate to be President of the United States. He set out to overcome the best part of 20 other candidates in the Republican Party before and during the primaries and was not considered by many in those early stages to have a prayer of living in the White House. The Republican Party was said to have great reservations about Trump and yet somehow he won the nomination. When you know how American politics works – politics in general – there is no way that Trump could have become the party's candidate unless the Sabbatian-controlled 'Neocons' that run the Republican Party wanted that to happen. We saw the proof in emails and documents made public by WikiLeaks that the Democratic Party hierarchy, or Democons, systematically undermined the campaign of Bernie Sanders to make sure that Sabbatian gofer Hillary Clinton won the nomination to be their presidential candidate. If the Democons could do that then the Neocons in the Republican Party could have derailed Trump in the same way. But they didn't and at that stage I began to conclude that Trump could well be the one chosen to be president. If that was the case the 'why' was pretty clear to see – the goal of dividing America between Cult agenda-supporting Wokers and Pushbackers who gravitated to Trump because he was telling them what they wanted to hear. His constituency of support had been increasingly ignored and voiceless for decades and profoundly through the eight years of Sabbatian puppet Barack Obama. Now here was someone speaking their language of pulling back from the incessant globalisation of political and economic power, the exporting of American jobs to China and elsewhere by 'American' (Sabbatian) corporations, the deletion of free speech, and the mass immigration policies that had further devastated job opportunities for the urban working class of all races and the once American heartlands of the Midwest.

Beware the forked tongue

Those people collectively sighed with relief that at last a political leader was apparently on their side, but another trait of the Renegade Mind is that you look even harder at people telling you

what you want to hear than those who are telling you otherwise. Obviously as I said earlier people wish what they want to hear to be true and genuine and they are much more likely to believe that than someone saying what they don't want to here and don't want to be true. Sales people are taught to be skilled in eliciting by calculated questioning what their customers want to hear and repeating that back to them as their own opinion to get their targets to like and trust them. Assets of the Cult are also sales people in the sense of selling perception. To read Cult manipulation you have to play the long and expanded game and not fall for the Vaudeville show of party politics. Both American parties are vehicles for the Cult and they exploit them in different ways depending on what the agenda requires at that moment. Trump and the Republicans were used to be the focus of dividing America and isolating Pushbackers to open the way for a Biden presidency to become the most extreme in American history by advancing the full-blown Woke (Cult) agenda with the aim of destroying and silencing Pushbackers now labelled Nazi Trump supporters and white supremacists.

Sabbatians wanted Trump in office for the reasons described by ultra-Zionist Saul Alinsky (1909-1972) who was promoting the Woke philosophy through 'community organising' long before anyone had heard of it. In those days it still went by its traditional name of Marxism. The reason for the manipulated Trump phenomenon was laid out in Alinsky's 1971 book, *Rules for Radicals*, which was his blueprint for overthrowing democratic and other regimes and replacing them with Sabbatian Marxism. Not surprisingly his to-do list was evident in the Sabbatian French and Russian 'Revolutions' and that in China which will become very relevant in the next chapter about the 'Covid' hoax. Among Alinsky's followers have been the deeply corrupt Barack Obama, House Speaker Nancy Pelosi and Hillary Clinton who described him as a 'hero'. All three are Sabbatian stooges with Pelosi personifying the arrogant corrupt idiocy that so widely fronts up for the Cult inner core. Predictably as a Sabbatian advocate of the 'light-bringer' Alinsky features Lucifer on the dedication page of his book as the original radical who gained

his own kingdom ('Earth' as we shall see). One of Alinsky's golden radical rules was to pick an individual and focus all attention, hatred and blame on them and not to target faceless bureaucracies and corporations. *Rules for Radicals* is really a Sabbatian handbook with its contents repeatedly employed all over the world for centuries and why wouldn't Sabbatians bring to power their designer-villain to be used as the individual on which all attention, hatred and blame was bestowed? This is what they did and the only question for me is how much Trump knew that and how much he was manipulated. A bit of both, I suspect. This was Alinsky's Trump technique from a man who died in 1972. The technique has spanned history:

Pick the target, freeze it, personalize it, polarize it. Don't try to attack abstract corporations or bureaucracies. Identify a responsible individual. Ignore attempts to shift or spread the blame.

From the moment Trump came to illusory power everything was about him. It wasn't about Republican policy or opinion, but all about Trump. Everything he did was presented in negative, derogatory and abusive terms by the Sabbatian-dominated media led by Cult operations such as CNN, MSNBC, *The New York Times* and the Jeff Bezos-owned *Washington Post* – 'Pick the target, freeze it, personalize it, polarize it.' Trump was turned into a demon to be vilified by those who hated him and a demi-god loved by those who worshipped him. This, in turn, had his supporters, too, presented as equally demonic in preparation for the punchline later down the line when Biden was about to take office. It was here's a Trump, there's a Trump, everywhere a Trump, Trump. Virtually every news story or happening was filtered through the lens of 'The Donald'. You loved him or hated him and which one you chose was said to define you as Satan's spawn or a paragon of virtue. Even supporting some Trump policies or statements and not others was enough for an assault on your character. No shades of grey were or are allowed. Everything is black and white (literally and figuratively). A Californian I knew had her head utterly scrambled by her hatred for Trump while telling people they should love each other. She was so totally consumed by

Trump Derangement Syndrome as it became to be known that this glaring contradiction would never have occurred to her. By definition anyone who criticised Trump or praised his opponents was a hero and this lady described Joe Biden as 'a kind, honest gentleman' when he's a provable liar, mega-crook and vicious piece of work to boot. Sabbatians had indeed divided America using Trump as the fall-guy and all along the clock was ticking on the consequences for his supporters.

In hock to his masters

Trump gave Sabbatians via Israel almost everything they wanted in his four years. Ask and you shall receive was the dynamic between himself and Benjamin Netanyahu orchestrated by Trump's ultra-Zionist son-in-law Jared Kushner, his ultra-Zionist Ambassador to Israel, David Friedman, and ultra-Zionist 'Israel adviser', Jason Greenblatt. The last two were central to the running and protecting from collapse of his business empire, the Trump Organisation, and colossal business failures made him forever beholding to Sabbatian networks that bailed him out. By the start of the 1990s Trump owed $4 billion to banks that he couldn't pay and almost $1billion of that was down to him personally and not his companies. This mega-disaster was the result of building two new casinos in Atlantic City and buying the enormous Taj Mahal operation which led to crippling debt payments. He had borrowed fantastic sums from 72 banks with major Sabbatian connections and although the scale of debt should have had him living in a tent alongside the highway they never foreclosed. A plan was devised to lift Trump from the mire by BT Securities Corporation and Rothschild Inc. and the case was handled by Wilber Ross who had worked for the Rothschilds for 27 years. Ross would be named US Commerce Secretary after Trump's election. Another crucial figure in saving Trump was ultra-Zionist 'investor' Carl Icahn who bought the Taj Mahal casino. Icahn was made special economic adviser on financial regulation in the Trump administration. He didn't stay long but still managed to find time to make a tidy sum of a reported $31.3 million when he sold his

holdings affected by the price of steel three days before Trump imposed a 235 percent tariff on steel imports. What amazing bits of luck these people have. Trump and Sabbatian operatives have long had a close association and his mentor and legal adviser from the early 1970s until 1986 was the dark and genetically corrupt ultra-Zionist Roy Cohn who was chief counsel to Senator Joseph McCarthy's 'communist' witch-hunt in the 1950s. *Esquire* magazine published an article about Cohn with the headline 'Don't mess with Roy Cohn'. He was described as the most feared lawyer in New York and 'a ruthless master of dirty tricks ... [with] ... more than one Mafia Don on speed dial'. Cohn's influence, contacts, support and protection made Trump a front man for Sabbatians in New York with their connections to one of Cohn's many criminal employers, the 'Russian' Sabbatian Mafia. Israel-centric media mogul Rupert Murdoch was introduced to Trump by Cohn and they started a long friendship. Cohn died in 1986 weeks after being disbarred for unethical conduct by the Appellate Division of the New York State Supreme Court. The wheels of justice do indeed run slow given the length of Cohn's crooked career.

QAnon-sense

We are asked to believe that Donald Trump with his fundamental connections to Sabbatian networks and operatives has been leading the fight to stop the Sabbatian agenda for the fascistic control of America and the world. Sure he has. A man entrapped during his years in the White House by Sabbatian operatives and whose biggest financial donor was casino billionaire Sheldon Adelson who was Sabbatian to his DNA?? Oh, do come on. Trump has been used to divide America and isolate Pushbackers on the Cult agenda under the heading of 'Trump supporters', 'insurrectionists' and 'white supremacists'. The US Intelligence/Mossad Psyop or psychological operation known as QAnon emerged during the Trump years as a central pillar in the Sabbatian campaign to lead Pushbackers into the trap set by those that wished to destroy them. I knew from the start that QAnon was a scam because I had seen the same scenario many

times before over 30 years under different names and I had written about one in particular in the books. 'Not again' was my reaction when QAnon came to the fore. The same script is pulled out every few years and a new name added to the letterhead. The story always takes the same form: 'Insiders' or 'the good guys' in the government-intelligence-military 'Deep State' apparatus were going to instigate mass arrests of the 'bad guys' which would include the Rockefellers, Rothschilds, Barack Obama, Hillary Clinton, George Soros, etc., etc. Dates are given for when the 'good guys' are going to move in, but the dates pass without incident and new dates are given which pass without incident. The central message to Pushbackers in each case is that they don't have to do anything because there is 'a plan' and it is all going to be sorted by the 'good guys' on the inside. 'Trust the plan' was a QAnon mantra when the only plan was to misdirect Pushbackers into putting their trust in a Psyop they believed to be real. Beware, beware, those who tell you what you want to hear and always check it out. Right up to Biden's inauguration QAnon was still claiming that 'the Storm' was coming and Trump would stay on as president when Biden and his cronies were arrested and jailed. It was never going to happen and of course it didn't, but what did happen as a result provided that punchline to the Sabbatian Trump/QAnon Psyop.

On January 6th, 2021, a very big crowd of Trump supporters gathered in the National Mall in Washington DC down from the Capitol Building to protest at what they believed to be widespread corruption and vote fraud that stopped Trump being re-elected for a second term as president in November, 2020. I say as someone that does not support Trump or Biden that the evidence is clear that major vote-fixing went on to favour Biden, a man with cognitive problems so advanced he can often hardly string a sentence together without reading the words written for him on the Teleprompter. Glaring ballot discrepancies included serious questions about electronic voting machines that make vote rigging a comparative cinch and hundreds of thousands of paper votes that suddenly appeared during already advanced vote counts and virtually all of

them for Biden. Early Trump leads in crucial swing states suddenly began to close and disappear. The pandemic hoax was used as the excuse to issue almost limitless numbers of mail-in ballots with no checks to establish that the recipients were still alive or lived at that address. They were sent to streams of people who had not even asked for them. Private organisations were employed to gather these ballots and who knows what they did with them before they turned up at the counts. The American election system has been manipulated over decades to become a sick joke with more holes than a Swiss cheese for the express purpose of dictating the results. Then there was the criminal manipulation of information by Sabbatian tech giants like Facebook, Twitter and Google-owned YouTube which deleted pro-Trump, anti-Biden accounts and posts while everything in support of Biden was left alone. Sabbatians wanted Biden to win because after the dividing of America it was time for full-on Woke and every aspect of the Cult agenda to be unleashed.

Hunter gatherer

Extreme Silicon Valley bias included blocking information by the *New York Post* exposing a Biden scandal that should have ended his bid for president in the final weeks of the campaign. Hunter Biden, his monumentally corrupt son, is reported to have sent a laptop to be repaired at a local store and failed to return for it. Time passed until the laptop became the property of the store for non-payment of the bill. When the owner saw what was on the hard drive he gave a copy to the FBI who did nothing even though it confirmed widespread corruption in which the Joe Biden family were using his political position, especially when he was vice president to Obama, to make multiple millions in countries around the world and most notably Ukraine and China. Hunter Biden's one-time business partner Tony Bobulinski went public when the story broke in the *New York Post* to confirm the corruption he saw and that Joe Biden not only knew what was going on he also profited from the spoils. Millions were handed over by a Chinese company with close

connections – like all major businesses in China – to the Chinese communist party of President Xi Jinping. Joe Biden even boasted at a meeting of the Cult's World Economic Forum that as vice president he had ordered the government of Ukraine to fire a prosecutor. What he didn't mention was that the same man just happened to be investigating an energy company which was part of Hunter Biden's corrupt portfolio. The company was paying him big bucks for no other reason than the influence his father had. Overnight Biden's presidential campaign should have been over given that he had lied publicly about not knowing what his son was doing. Instead almost the entire Sabbatian-owned mainstream media and Sabbatian-owned Silicon Valley suppressed circulation of the story. This alone went a mighty way to rigging the election of 2020. Cult assets like Mark Zuckerberg at Facebook also spent hundreds of millions to be used in support of Biden and vote 'administration'.

The Cult had used Trump as the focus to divide America and was now desperate to bring in moronic, pliable, corrupt Biden to complete the double-whammy. No way were they going to let little things like the will of the people thwart their plan. Silicon Valley widely censored claims that the election was rigged because it *was* rigged. For the same reason anyone claiming it was rigged was denounced as a 'white supremacist' including the pathetically few Republican politicians willing to say so. Right across the media where the claim was mentioned it was described as a 'false claim' even though these excuses for 'journalists' would have done no research into the subject whatsoever. Trump won seven million more votes than any sitting president had ever achieved while somehow a cognitively-challenged soon to be 78-year-old who was hidden away from the public for most of the campaign managed to win more votes than any presidential candidate in history. It makes no sense. You only had to see election rallies for both candidates to witness the enthusiasm for Trump and the apathy for Biden. Tens of thousands would attend Trump events while Biden was speaking in empty car parks with often only television crews attending and framing their shots to hide the fact that no one was there. It was pathetic to see

footage come to light of Biden standing at a podium making speeches only to TV crews and party fixers while reading the words written for him on massive Teleprompter screens. So, yes, those protestors on January 6th had a point about election rigging, but some were about to walk into a trap laid for them in Washington by the Cult Deep State and its QAnon Psyop. This was the Capitol Hill riot ludicrously dubbed an 'insurrection'.

The spider and the fly

Renegade Minds know there are not two 'sides' in politics, only one side, the Cult, working through all 'sides'. It's a stage show, a puppet show, to direct the perceptions of the population into focusing on diversions like parties and candidates while missing the puppeteers with their hands holding all the strings. The Capitol Hill 'insurrection' brings us back to the Little Big Horn. Having created two distinct opposing groupings – Woke and Pushbackers – the trap was about to be sprung. Pushbackers were to be encircled and isolated by associating them all in the public mind with Trump and then labelling Trump as some sort of Confederate leader. I knew immediately that the Capitol riot was a set-up because of two things. One was how easy the rioters got into the building with virtually no credible resistance and secondly I could see – as with the 'Covid' hoax in the West at the start of 2020 – how the Cult could exploit the situation to move its agenda forward with great speed. My experience of Cult techniques and activities over more than 30 years has showed me that while they do exploit situations they haven't themselves created this never happens with events of fundamental agenda significance. Every time major events giving cultists the excuse to rapidly advance their plan you find they are manipulated into being for the specific reason of providing that excuse – Problem-Reaction-Solution. Only a tiny minority of the huge crowd of Washington protestors sought to gain entry to the Capitol by smashing windows and breaching doors. That didn't matter. The whole crowd and all Pushbackers, even if they did not support Trump, were going to be lumped together as dangerous

insurrectionists and conspiracy theorists. The latter term came into widespread use through a CIA memo in the 1960s aimed at discrediting those questioning the nonsensical official story of the Kennedy assassination and it subsequently became widely employed by the media. It's still being used by inept 'journalists' with no idea of its origin to discredit anyone questioning anything that authority claims to be true. When you are perpetrating a conspiracy you need to discredit the very word itself even though the dictionary definition of conspiracy is merely 'the activity of secretly planning with other people to do something bad or illegal' and 'a general agreement to keep silent about a subject for the purpose of keeping it secret'. On that basis there are conspiracies almost wherever you look. For obvious reasons the Cult and its lapdog media have to claim there are no conspiracies even though the word appears in state laws as with conspiracy to defraud, to murder, and to corrupt public morals.

Agent provocateurs are widely used by the Cult Deep State to manipulate genuine people into acting in ways that suit the desired outcome. By genuine in this case I mean protestors genuinely supporting Trump and claims that the election was stolen. In among them, however, were agents of the state wearing the garb of Trump supporters and QAnon to pump-prime the Capital riot which some genuine Trump supporters naively fell for. I described the situation as 'Come into my parlour said the spider to the fly'. Leaflets appeared through the Woke paramilitary arm Antifa, the anti-fascist fascists, calling on supporters to turn up in Washington looking like Trump supporters even though they hated him. Some of those arrested for breaching the Capitol Building were sourced to Antifa and its stable mate Black Lives Matter. Both organisations are funded by Cult billionaires and corporations. One man charged for the riot was according to his lawyer a former FBI agent who had held top secret security clearance for 40 years. Attorney Thomas Plofchan said of his client, 66-year-old Thomas Edward Caldwell:

He has held a Top Secret Security Clearance since 1979 and has undergone multiple Special Background Investigations in support of his clearances. After retiring from the Navy, he

worked as a section chief for the Federal Bureau of Investigation from 2009-2010 as a GS-12 [mid-level employee].

He also formed and operated a consulting firm performing work, often classified, for U.S government customers including the US. Drug Enforcement Agency, Department of Housing and Urban Development, the US Coast Guard, and the US Army Personnel Command.

A judge later released Caldwell pending trial in the absence of evidence about a conspiracy or that he tried to force his way into the building. *The New York Post* reported a 'law enforcement source' as saying that 'at least two known Antifa members were spotted' on camera among Trump supporters during the riot while one of the rioters arrested was John Earle Sullivan, a seriously extreme Black Lives Matter Trump-hater from Utah who was previously arrested and charged in July, 2020, over a BLM-Antifa riot in which drivers were threatened and one was shot. Sullivan is the founder of Utah-based Insurgence USA which is an affiliate of the Cult-created-and-funded Black Lives Matter movement. Footage appeared and was then deleted by Twitter of Trump supporters calling out Antifa infiltrators and a group was filmed changing into pro-Trump clothing before the riot. Security at the building was *pathetic* – as planned. Colonel Leroy Fletcher Prouty, a man with long experience in covert operations working with the US security apparatus, once described the tell-tale sign to identify who is involved in an assassination. He said:

No one has to direct an assassination – it happens. The active role is played secretly by permitting it to happen. This is the greatest single clue. Who has the power to call off or reduce the usual security precautions?

This principle applies to many other situations and certainly to the Capitol riot of January 6th, 2021.

The sting

With such a big and potentially angry crowd known to be gathering near the Capitol the security apparatus would have had a major police detail to defend the building with National Guard troops on

standby given the strength of feeling among people arriving from all over America encouraged by the QAnon Psyop and statements by Donald Trump. Instead Capitol Police 'security' was flimsy, weak, and easily breached. The same number of officers was deployed as on a regular day and that is a blatant red flag. They were not staffed or equipped for a possible riot that had been an obvious possibility in the circumstances. No protective and effective fencing worth the name was put in place and there were no contingency plans. The whole thing was basically a case of standing aside and waving people in. Once inside police mostly backed off apart from one Capitol police officer who ridiculously shot dead unarmed Air Force veteran protestor Ashli Babbitt without a warning as she climbed through a broken window. The 'investigation' refused to name or charge the officer after what must surely be considered a murder in the circumstances. They just lifted a carpet and swept. The story was endlessly repeated about five people dying in the 'armed insurrection' when there was no report of rioters using weapons. Apart from Babbitt the other four died from a heart attack, strokes and apparently a drug overdose. Capitol police officer Brian Sicknick was reported to have died after being bludgeoned with a fire extinguisher when he was alive after the riot was over and died later of what the Washington Medical Examiner's Office said was a stroke. Sicknick had no external injuries. The lies were delivered like rapid fire. There was a narrative to build with incessant repetition of the lie until the lie became the accepted 'everybody knows that' truth. The 'Big Lie' technique of Nazi Propaganda Minister Joseph Goebbels is constantly used by the Cult which was behind the Nazis and is today behind the 'Covid' and 'climate change' hoaxes. Goebbels said:

If you tell a lie big enough and keep repeating it, people will eventually come to believe it. The lie can be maintained only for such time as the State can shield the people from the political, economic and/or military consequences of the lie. It thus becomes vitally important for the State to use all of its powers to repress dissent, for the truth is the mortal enemy of the lie, and thus by extension, the truth is the greatest enemy of the State.

Most protestors had a free run of the Capitol Building. This allowed pictures to be taken of rioters in iconic parts of the building including the Senate chamber which could be used as propaganda images against all Pushbackers. One Congresswoman described the scene as 'the worst kind of non-security anybody could ever imagine'. Well, the first part was true, but someone obviously did imagine it and made sure it happened. Some photographs most widely circulated featured people wearing QAnon symbols and now the Psyop would be used to dub all QAnon followers with the ubiquitous fit-all label of 'white supremacist' and 'insurrectionists'. When a Muslim extremist called Noah Green drove his car at two police officers at the Capitol Building killing one in April, 2021, there was no such political and media hysteria. They were just disappointed he wasn't white.

The witch-hunt

Government prosecutor Michael Sherwin, an aggressive, dark-eyed, professional Rottweiler led the 'investigation' and to call it over the top would be to understate reality a thousand fold. Hundreds were tracked down and arrested for the crime of having the wrong political views and people were jailed who had done nothing more than walk in the building, committed no violence or damage to property, took a few pictures and left. They were labelled a 'threat to the Republic' while Biden sat in the White House signing executive orders written for him that were dismantling 'the Republic'. Even when judges ruled that a mother and son should not be in jail the government kept them there. Some of those arrested have been badly beaten by prison guards in Washington and lawyers for one man said he suffered a fractured skull and was made blind in one eye. Meanwhile a woman is shot dead for no reason by a Capitol Police officer and we are not allowed to know who he is never mind what has happened to him although that will be *nothing*. The Cult's QAnon/Trump sting to identify and isolate Pushbackers and then target them on the road to crushing and deleting them was a resounding success. You would have thought the Russians had

invaded the building at gunpoint and lined up senators for a firing squad to see the political and media reaction. Congresswoman Alexandria Ocasio-Cortez is a child in a woman's body, a terrible-twos, me, me, me, Woker narcissist of such proportions that words have no meaning. She said she thought she was going to die when 'insurrectionists' banged on her office door. It turned out she wasn't even in the Capitol Building when the riot was happening and the 'banging' was a Capitol Police officer. She referred to herself as a 'survivor' which is an insult to all those true survivors of violent and sexual abuse while she lives her pampered and privileged life talking drivel for a living. Her Woke colleague and fellow mega-narcissist Rashida Tlaib broke down describing the devastating effect on her, too, of *not being* in the building when the rioters were there. Ocasio-Cortez and Tlaib are members of a fully-Woke group of Congresswomen known as 'The Squad' along with Ilhan Omar and Ayanna Pressley. The Squad from what I can see can be identified by its vehement anti-white racism, anti-white men agenda, and, as always in these cases, the absence of brain cells on active duty.

The usual suspects were on the riot case immediately in the form of Democrat ultra-Zionist senators and operatives Chuck Schumer and Adam Schiff demanding that Trump be impeached for 'his part in the insurrection'. The same pair of prats had led the failed impeachment of Trump over the invented 'Russia collusion' nonsense which claimed Russia had helped Trump win the 2016 election. I didn't realise that Tel Aviv had been relocated just outside Moscow. I must find an up-to-date map. The Russia hoax was a Sabbatian operation to keep Trump occupied and impotent and to stop any rapport with Russia which the Cult wants to retain as a perceptual enemy to be pulled out at will. Puppet Biden began attacking Russia when he came to office as the Cult seeks more upheaval, division and war across the world. A two-year stage show 'Russia collusion inquiry' headed by the not-very-bright former 9/11 FBI chief Robert Mueller, with support from 19 lawyers, 40 FBI agents plus intelligence analysts, forensic accountants and other

staff, devoured tens of millions of dollars and found no evidence of Russia collusion which a ten-year-old could have told them on day one. Now the same moronic Schumer and Schiff wanted a second impeachment of Trump over the Capitol 'insurrection' (riot) which the arrested development of Schumer called another 'Pearl Harbor' while others compared it with 9/11 in which 3,000 died and, in the case of CNN, with the Rwandan genocide in the 1990s in which an estimated 500,000 to 600,000 were murdered, between 250, 000 and 500,000 women were raped, and populations of whole towns were hacked to death with machetes. To make those comparisons purely for Cult political reasons is beyond insulting to those that suffered and lost their lives and confirms yet again the callous inhumanity that we are dealing with. Schumer is a monumental idiot and so is Schiff, but they serve the Cult agenda and do whatever they're told so they get looked after. Talking of idiots – another inane man who spanned the Russia and Capitol impeachment attempts was Senator Eric Swalwell who had the nerve to accuse Trump of collusion with the Russians while sleeping with a Chinese spy called Christine Fang or 'Fang Fang' which is straight out of a Bond film no doubt starring Klaus Schwab as the bloke living on a secret island and controlling laser weapons positioned in space and pointing at world capitals. Fang Fang plays the part of Bond's infiltrator girlfriend which I'm sure she would enjoy rather more than sharing a bed with the brainless Swalwell, lying back and thinking of China. The FBI eventually warned Swalwell about Fang Fang which gave her time to escape back to the Chinese dictatorship. How very thoughtful of them. The second Trump impeachment also failed and hardly surprising when an impeachment is supposed to remove a sitting president and by the time it happened Trump was no longer president. These people are running your country America, well, officially anyway. Terrifying isn't it?

Outcomes tell the story - always

The outcome of all this – and it's the *outcome* on which Renegade Minds focus, not the words – was that a vicious, hysterical and

obviously pre-planned assault was launched on Pushbackers to censor, silence and discredit them and even targeted their right to earn a living. They have since been condemned as 'domestic terrorists' that need to be treated like Al-Qaeda and Islamic State. 'Domestic terrorists' is a label the Cult has been trying to make stick since the period of the Oklahoma bombing in 1995 which was blamed on 'far-right domestic terrorists'. If you read *The Trigger* you will see that the bombing was clearly a Problem-Reaction-Solution carried out by the Deep State during a Bill Clinton administration so corrupt that no dictionary definition of the term would even nearly suffice. Nearly 30, 000 troops were deployed from all over America to the empty streets of Washington for Biden's inauguration. Ten thousand of them stayed on with the pretext of protecting the capital from insurrectionists when it was more psychological programming to normalise the use of the military in domestic law enforcement in support of the Cult plan for a police-military state. Biden's fascist administration began a purge of 'wrong-thinkers' in the military which means anyone that is not on board with Woke. The Capitol Building was surrounded by a fence with razor wire and the Land of the Free was further symbolically and literally dismantled. The circle was completed with the installation of Biden and the exploitation of the QAnon Psyop.

America had never been so divided since the civil war of the 19th century, Pushbackers were isolated and dubbed terrorists and now, as was always going to happen, the Cult immediately set about deleting what little was left of freedom and transforming American society through a swish of the hand of the most controlled 'president' in American history leading (officially at least) the most extreme regime since the country was declared an independent state on July 4th, 1776. Biden issued undebated, dictatorial executive orders almost by the hour in his opening days in office across the whole spectrum of the Cult wish-list including diluting controls on the border with Mexico allowing thousands of migrants to illegally enter the United States to transform the demographics of America and import an election-changing number of perceived Democrat

voters. Then there were Biden deportation amnesties for the already illegally resident (estimated to be as high as 20 or even 30 million). A bill before Congress awarded American citizenship to anyone who could prove they had worked in agriculture for just 180 days in the previous two years as 'Big Ag' secured its slave labour long-term. There were the plans to add new states to the union such as Puerto Rico and making Washington DC a state. They are all parts of a plan to ensure that the Cult-owned Woke Democrats would be permanently in power.

Border – what border?

I have exposed in detail in other books how mass immigration into the United States and Europe is the work of Cult networks fuelled by the tens of billions spent to this and other ends by George Soros and his global Open Society (open borders) Foundations. The impact can be seen in America alone where the population has increased by *100 million* in little more than 30 years mostly through immigration. I wrote in *The Answer* that the plan was to have so many people crossing the southern border that the numbers become unstoppable and we are now there under Cult-owned Biden. El Salvador in Central America puts the scale of what is happening into context. A third of the population now lives in the United States, much of it illegally, and many more are on the way. The methodology is to crush Central and South American countries economically and spread violence through machete-wielding psychopathic gangs like MS-13 based in El Salvador and now operating in many American cities. Biden-imposed lax security at the southern border means that it is all but open. He said before his 'election' that he wanted to see a surge towards the border if he became president and that was the green light for people to do just that after election day to create the human disaster that followed for both America and the migrants. When that surge came the imbecilic Alexandria Ocasio-Cortez said it wasn't a 'surge' because they are 'children, not insurgents' and the term 'surge' (used by Biden) was a claim of 'white supremacists'.

This disingenuous lady may one day enter the realm of the most basic intelligence, but it won't be any time soon.

Sabbatians and the Cult are in the process of destroying America by importing violent people and gangs in among the genuine to terrorise American cities and by overwhelming services that cannot cope with the sheer volume of new arrivals. Something similar is happening in Europe as Western society in general is targeted for demographic and cultural transformation and upheaval. The plan demands violence and crime to create an environment of intimidation, fear and division and Soros has been funding the election of district attorneys across America who then stop prosecuting many crimes, reduce sentences for violent crimes and free as many violent criminals as they can. Sabbatians are creating the chaos from which order – their order – can respond in a classic Problem-Reaction-Solution. A Freemasonic moto says 'Ordo Ab Chao' (Order out of Chaos) and this is why the Cult is constantly creating chaos to impose a new 'order'. Here you have the reason the Cult is constantly creating chaos. The 'Covid' hoax can be seen with those entering the United States by plane being forced to take a 'Covid' test while migrants flooding through southern border processing facilities do not. Nothing is put in the way of mass migration and if that means ignoring the government's own 'Covid' rules then so be it. They know it's all bullshit anyway. Any pushback on this is denounced as 'racist' by Wokers and Sabbatian fronts like the ultra-Zionist Anti-Defamation League headed by the appalling Jonathan Greenblatt which at the same time argues that Israel should not give citizenship and voting rights to more Palestinian Arabs or the 'Jewish population' (in truth the Sabbatian network) will lose control of the country.

Society-changing numbers

Biden's masters have declared that countries like El Salvador are so dangerous that their people must be allowed into the United States for humanitarian reasons when there are fewer murders in large parts of many Central American countries than in US cities like

Baltimore. That is not to say Central America cannot be a dangerous place and Cult-controlled American governments have been making it so since way back, along with the dismantling of economies, in a long-term plan to drive people north into the United States. Parts of Central America are very dangerous, but in other areas the story is being greatly exaggerated to justify relaxing immigration criteria. Migrants are being offered free healthcare and education in the United States as another incentive to head for the border and there is no requirement to be financially independent before you can enter to prevent the resources of America being drained. You can't blame migrants for seeking what they believe will be a better life, but they are being played by the Cult for dark and nefarious ends. The numbers since Biden took office are huge. In February, 2021, more than 100,000 people were known to have tried to enter the US illegally through the southern border (it was 34,000 in the same month in 2020) and in March it was 170,000 – a 418 percent increase on March, 2020. These numbers are only known people, not the ones who get in unseen. The true figure for migrants illegally crossing the border in a single month was estimated by one congressman at 250,000 and that number will only rise under Biden's current policy. Gangs of murdering drug-running thugs that control the Mexican side of the border demand money – thousands of dollars – to let migrants cross the Rio Grande into America. At the same time gun battles are breaking out on the border several times a week between rival Mexican drug gangs (which now operate globally) who are equipped with sophisticated military-grade weapons, grenades and armoured vehicles. While the Capitol Building was being 'protected' from a non-existent 'threat' by thousands of troops, and others were still deployed at the time in the Cult Neocon war in Afghanistan, the southern border of America was left to its fate. This is not incompetence, it is cold calculation.

By March, 2021, there were 17,000 unaccompanied children held at border facilities and many of them are ensnared by people traffickers for paedophile rings and raped on their journey north to America. This is not conjecture – this is fact. Many of those designated

children are in reality teenage boys or older. Meanwhile Wokers posture their self-purity for encouraging poor and tragic people to come to America and face this nightmare both on the journey and at the border with the disgusting figure of House Speaker Nancy Pelosi giving disingenuous speeches about caring for migrants. The woman's evil. Wokers condemned Trump for having children in cages at the border (so did Obama, *Shhhh*), but now they are sleeping on the floor without access to a shower with one border facility 729 percent over capacity. The Biden insanity even proposed flying migrants from the southern border to the northern border with Canada for 'processing'. The whole shambles is being overseen by ultra-Zionist Secretary of Homeland Security, the moronic liar Alejandro Mayorkas, who banned news cameras at border facilities to stop Americans seeing what was happening. Mayorkas said there was not a ban on news crews; it was just that they were not allowed to film. Alongside him at Homeland Security is another ultra-Zionist Cass Sunstein appointed by Biden to oversee new immigration laws. Sunstein despises conspiracy researchers to the point where he suggests they should be banned or *taxed* for having such views. The man is not bonkers or anything. He's perfectly well-adjusted, but adjusted to what is the question. Criticise what is happening and you are a 'white supremacist' when earlier non-white immigrants also oppose the numbers which effect their lives and opportunities. Black people in poor areas are particularly damaged by uncontrolled immigration and the increased competition for work opportunities with those who will work for less. They are also losing voting power as Hispanics become more dominant in former black areas. It's a downward spiral for them while the billionaires behind the policy drone on about how much they care about black people and 'racism'. None of this is about compassion for migrants or black people – that's just wind and air. Migrants are instead being mercilessly exploited to transform America while the countries they leave are losing their future and the same is true in Europe. Mass immigration may now be the work of Woke Democrats, but it can be traced back to the 1986 Immigration Reform and Control Act (it

wasn't) signed into law by Republican hero President Ronald Reagan which gave amnesty to millions living in the United States illegally and other incentives for people to head for the southern border. Here we have the one-party state at work again.

Save me syndrome

Almost every aspect of what I have been exposing as the Cult agenda was on display in even the first days of 'Biden' with silencing of Pushbackers at the forefront of everything. A Renegade Mind will view the Trump years and QAnon in a very different light to their supporters and advocates as the dots are connected. The QAnon/Trump Psyop has given the Cult all it was looking for. We may not know how much, or little, that Trump realised he was being used, but that's a side issue. This pincer movement produced the desired outcome of dividing America and having Pushbackers isolated. To turn this around we have to look at new routes to empowerment which do not include handing our power to other people and groups through what I will call the 'Save Me Syndrome' – 'I want someone else to do it so that I don't have to'. We have seen this at work throughout human history and the QAnon/Trump Psyop is only the latest incarnation alongside all the others. Religion is an obvious expression of this when people look to a 'god' or priest to save them or tell them how to be saved and then there are 'save me' politicians like Trump. Politics is a diversion and not a 'saviour'. It is a means to block positive change, not make it possible.

Save Me Syndrome always comes with the same repeating theme of handing your power to whom or what you believe will save you while your real 'saviour' stares back from the mirror every morning. Renegade Minds are constantly vigilant in this regard and always asking the question 'What can I do?' rather than 'What can someone else do for me?' Gandhi was right when he said: 'You must be the change you want to see in the world.' We are indeed the people we have been waiting for. We are presented with a constant raft of reasons to concede that power to others and forget where the real power is. Humanity has the numbers and the Cult does not. It has to

use diversion and division to target the unstoppable power that comes from unity. Religions, governments, politicians, corporations, media, QAnon, are all different manifestations of this power-diversion and dilution. Refusing to give your power to governments and instead handing it to Trump and QAnon is not to take a new direction, but merely to recycle the old one with new names on the posters. I will explore this phenomenon as we proceed and how to break the cycles and recycles that got us here through the mists of repeating perception and so repeating history.

For now we shall turn to the most potent example in the entire human story of the consequences that follow when you give your power away. I am talking, of course, of the 'Covid' hoax.

CHAPTER FOUR

'Covid': Calculated catastrophe

Facts are threatening to those invested in fraud
DaShanne Stokes

We can easily unravel the real reason for the 'Covid pandemic' hoax by employing the Renegade Mind methodology that I have outlined this far. We'll start by comparing the long-planned Cult outcome with the 'Covid pandemic' outcome. Know the outcome and you'll see the journey.

I have highlighted the plan for the Hunger Games Society which has been in my books for so many years with the very few controlling the very many through ongoing dependency. To create this dependency it is essential to destroy independent livelihoods, businesses and employment to make the population reliant on the state (the Cult) for even the basics of life through a guaranteed pittance income. While independence of income remained these Cult ambitions would be thwarted. With this knowledge it was easy to see where the 'pandemic' hoax was going once talk of 'lockdowns' began and the closing of all but perceived 'essential' businesses to 'save' us from an alleged 'deadly virus'. Cult corporations like Amazon and Walmart were naturally considered 'essential' while mom and pop shops and stores had their doors closed by fascist decree. As a result with every new lockdown and new regulation more small and medium, even large businesses not owned by the Cult, went to the wall while Cult giants and their frontmen and women grew financially fatter by the second. Mom and pop were

denied an income and the right to earn a living and the wealth of people like Jeff Bezos (Amazon), Mark Zuckerberg (Facebook) and Sergei Brin and Larry Page (Google/Alphabet) have reached record levels. The Cult was increasing its own power through further dramatic concentrations of wealth while the competition was being destroyed and brought into a state of dependency. Lockdowns have been instigated to secure that very end and were never anything to do with health. My brother Paul spent 45 years building up a bus repair business, but lockdowns meant buses were running at a fraction of normal levels for months on end. Similar stories can told in their hundreds of millions worldwide. Efforts of a lifetime coldly destroyed by Cult multi-billionaires and their lackeys in government and law enforcement who continued to earn their living from the taxation of the people while denying the right of the same people to earn theirs. How different it would have been if those making and enforcing these decisions had to face the same financial hardships of those they affected, but they never do.

Gates of Hell

Behind it all in the full knowledge of what he is doing and why is the psychopathic figure of Cult operative Bill Gates. His puppet Tedros at the World Health Organization declared 'Covid' a pandemic in March, 2020. The WHO had changed the definition of a 'pandemic' in 2009 just a month before declaring the 'swine flu pandemic' which would not have been so under the previous definition. The same applies to 'Covid'. The definition had included… 'an infection by an infectious agent, occurring simultaneously in different countries, with a significant mortality rate relative to the proportion of the population infected'. The new definition removed the need for 'significant mortality'. The 'pandemic' has been fraudulent even down to the definition, but Gates demanded economy-destroying lockdowns, school closures, social distancing, mandatory masks, a 'vaccination' for every man, woman and child on the planet and severe consequences and restrictions for those that refused. Who gave him this power? The

Cult did which he serves like a little boy in short trousers doing what his daddy tells him. He and his psychopathic missus even smiled when they said that much worse was to come (what they knew was planned to come). Gates responded in the matter-of-fact way of all psychopaths to a question about the effect on the world economy of what he was doing:

> Well, it won't go to zero but it will shrink. Global GDP is probably going to take the biggest hit ever [Gates was smiling as he said this] … in my lifetime this will be the greatest economic hit. But you don't have a choice. People act as if you have a choice. People don't feel like going to the stadium when they might get infected … People are deeply affected by seeing these stats, by knowing they could be part of the transmission chain, old people, their parents and grandparents, could be affected by this, and so you don't get to say ignore what is going on here.
>
> There will be the ability to open up, particularly in rich countries, if things are done well over the next few months, but for the world at large normalcy only returns when we have largely vaccinated the entire population.

The man has no compassion or empathy. How could he when he's a psychopath like all Cult players? My own view is that even beyond that he is very seriously mentally ill. Look in his eyes and you can see this along with his crazy flailing arms. You don't do what he has done to the world population since the start of 2020 unless you are mentally ill and at the most extreme end of psychopathic. You especially don't do it when to you know, as we shall see, that cases and deaths from 'Covid' are fakery and a product of monumental figure massaging. 'These stats' that Gates referred to are based on a 'test' that's not testing for the 'virus' as he has known all along. He made his fortune with big Cult support as an infamously ruthless software salesman and now buys global control of 'health' (death) policy without the population he affects having any say. It's a breathtaking outrage. Gates talked about people being deeply affected by fear of 'Covid' when that was because of *him* and his global network lying to them minute-by-minute supported by a lying media that he seriously influences and funds to the tune of hundreds of millions. He's handed big sums to media operations including the BBC, NBC, Al Jazeera, Univision, *PBS NewsHour*,

ProPublica, National Journal, The Guardian, The Financial Times, The Atlantic, Texas Tribune, USA Today publisher Gannett, *Washington Monthly, Le Monde,* Center for Investigative Reporting, Pulitzer Center on Crisis Reporting, National Press Foundation, International Center for Journalists, Solutions Journalism Network, the Poynter Institute for Media Studies, and many more. Gates is everywhere in the 'Covid' hoax and the man must go to prison – or a mental facility – for the rest of his life and his money distributed to those he has taken such enormous psychopathic pleasure in crushing.

The Muscle

The Hunger Games global structure demands a police-military state – a fusion of the two into one force – which viciously imposes the will of the Cult on the population and protects the Cult from public rebellion. In that regard, too, the 'Covid' hoax just keeps on giving. Often unlawful, ridiculous and contradictory 'Covid' rules and regulations have been policed across the world by moronic automatons and psychopaths made faceless by face-nappy masks and acting like the Nazi SS and fascist blackshirts and brownshirts of Hitler and Mussolini. The smallest departure from the rules decreed by the psychos in government and their clueless gofers were jumped upon by the face-nappy fascists. Brutality against public protestors soon became commonplace even on girls, women and old people as the brave men with the batons – the Face-Nappies as I call them – broke up peaceful protests and handed out fines like confetti to people who couldn't earn a living let alone pay hundreds of pounds for what was once an accepted human right. Robot Face-Nappies of Nottingham police in the English East Midlands fined one group £11,000 for attending a child's birthday party. For decades I charted the transformation of law enforcement as genuine, decent officers were replaced with psychopaths and the brain dead who would happily and brutally do whatever their masters told them. Now they were let loose on the public and I would emphasise the point that none of this just happened. The step-by-step change in the dynamic between police and public was orchestrated from the shadows by

those who knew where this was all going and the same with the perceptual reframing of those in all levels of authority and official administration through 'training courses' by organisations such as Common Purpose which was created in the late 1980s and given a massive boost in Blair era Britain until it became a global phenomenon. Supposed public 'servants' began to view the population as the enemy and the same was true of the police. This was the start of the explosion of behaviour manipulation organisations and networks preparing for the all-war on the human psyche unleashed with the dawn of 2020. I will go into more detail about this later in the book because it is a core part of what is happening.

Police desecrated beauty spots to deter people gathering and arrested women for walking in the countryside alone 'too far' from their homes. We had arrogant, clueless sergeants in the Isle of Wight police where I live posting on Facebook what they insisted the population must do or else. A schoolmaster sergeant called Radford looked young enough for me to ask if his mother knew he was out, but he was posting what he *expected* people to do while a Sergeant Wilkinson boasted about fining lads for meeting in a McDonald's car park where they went to get a lockdown takeaway. Wilkinson added that he had even cancelled their order. What a pair of prats these people are and yet they have increasingly become the norm among Jackboot Johnson's Yellowshirts once known as the British police. This was the theme all over the world with police savagery common during lockdown protests in the United States, the Netherlands, and the fascist state of Victoria in Australia under its tyrannical and again moronic premier Daniel Andrews. Amazing how tyrannical and moronic tend to work as a team and the same combination could be seen across America as arrogant, narcissistic Woke governors and mayors such as Gavin Newsom (California), Andrew Cuomo (New York), Gretchen Whitmer (Michigan), Lori Lightfoot (Chicago) and Eric Garcetti (Los Angeles) did their Nazi and Stalin impressions with the full support of the compliant brutality of their enforcers in uniform as they arrested small business owners defying

fascist shutdown orders and took them to jail in ankle shackles and handcuffs. This happened to bistro owner Marlena Pavlos-Hackney in Gretchen Whitmer's fascist state of Michigan when police arrived to enforce an order by a state-owned judge for 'putting the community at risk' at a time when other states like Texas were dropping restrictions and migrants were pouring across the southern border without any 'Covid' questions at all. I'm sure there are many officers appalled by what they are ordered to do, but not nearly enough of them. If they were truly appalled they would not do it. As the months passed every opportunity was taken to have the military involved to make their presence on the streets ever more familiar and 'normal' for the longer-term goal of police-military fusion.

Another crucial element to the Hunger Games enforcement network has been encouraging the public to report neighbours and others for 'breaking the lockdown rules'. The group faced with £11,000 in fines at the child's birthday party would have been dobbed-in by a neighbour with a brain the size of a pea. The technique was most famously employed by the Stasi secret police in communist East Germany who had public informants placed throughout the population. A police chief in the UK says his force doesn't need to carry out 'Covid' patrols when they are flooded with so many calls from the public reporting other people for visiting the beach. Dorset police chief James Vaughan said people were so enthusiastic about snitching on their fellow humans they were now operating as an auxiliary arm of the police: 'We are still getting around 400 reports a week from the public, so we will respond to reports …We won't need to be doing hotspot patrols because people are very quick to pick the phone up and tell us.' Vaughan didn't say that this is a pillar of all tyrannies of whatever complexion and the means to hugely extend the reach of enforcement while spreading distrust among the people and making them wary of doing anything that might get them reported. Those narcissistic Isle of Wight sergeants Radford and Wilkinson never fail to add a link to their Facebook posts where the public can inform on their fellow slaves.

Neither would be self-aware enough to realise they were imitating the Stasi which they might well never have heard of. Government psychologists that I will expose later laid out a policy to turn communities against each other in the same way.

A coincidence? Yep, and I can knit fog

I knew from the start of the alleged pandemic that this was a Cult operation. It presented limitless potential to rapidly advance the Cult agenda and exploit manipulated fear to demand that every man, woman and child on the planet was 'vaccinated' in a process never used on humans before which infuses self-replicating *synthetic* material into human cells. Remember the plan to transform the human body from a biological to a synthetic biological state. I'll deal with the 'vaccine' (that's not actually a vaccine) when I focus on the genetic agenda. Enough to say here that mass global 'vaccination' justified by this 'new virus' set alarms ringing after 30 years of tracking these people and their methods. The 'Covid' hoax officially beginning in China was also a big red flag for reasons I will be explaining. The agenda potential was so enormous that I could dismiss any idea that the 'virus' appeared naturally. Major happenings with major agenda implications never occur without Cult involvement in making them happen. My questions were twofold in early 2020 as the media began its campaign to induce global fear and hysteria: Was this alleged infectious agent released on purpose by the Cult or did it even exist at all? I then did what I always do in these situations. I sat, observed and waited to see where the evidence and information would take me. By March and early April synchronicity was strongly – and ever more so since then – pointing me in the direction of *there is no 'virus'*. I went public on that with derision even from swathes of the alternative media that voiced a scenario that the Chinese government released the 'virus' in league with Deep State elements in the United States from a top-level bio-lab in Wuhan where the 'virus' is said to have first appeared. I looked at that possibility, but I didn't buy it for several reasons. Deaths from the 'virus' did not in any way match what they

would have been with a 'deadly bioweapon' and it is much more effective if you sell the *illusion* of an infectious agent rather than having a real one unless you can control through injection who has it and who doesn't. Otherwise you lose control of events. A made-up 'virus' gives you a blank sheet of paper on which you can make it do whatever you like and have any symptoms or mutant 'variants' you choose to add while a real infectious agent would limit you to what it actually does. A phantom disease allows you to have endless ludicrous 'studies' on the 'Covid' dollar to widen the perceived impact by inventing ever more 'at risk' groups including one study which said those who walk slowly may be almost four times more likely to die from the 'virus'. People are in psychiatric wards for less.

A real 'deadly bioweapon' can take out people in the hierarchy that are not part of the Cult, but essential to its operation. Obviously they don't want that. Releasing a real disease means you immediately lose control of it. Releasing an illusory one means you don't. Again it's vital that people are extra careful when dealing with what they want to hear. A bioweapon unleashed from a Chinese laboratory in collusion with the American Deep State may fit a conspiracy narrative, but is it true? Would it not be far more effective to use the excuse of a 'virus' to justify the real bioweapon – the 'vaccine'? That way your disease agent does not have to be transmitted and arrives directly through a syringe. I saw a French virologist Luc Montagnier quoted in the alternative media as saying he had discovered that the alleged 'new' severe acute respiratory syndrome coronavirus , or SARS-CoV-2, was made artificially and included elements of the human immunodeficiency 'virus' (HIV) and a parasite that causes malaria. SARS-CoV-2 is alleged to trigger an alleged illness called Covid-19. I remembered Montagnier's name from my research years before into claims that an HIV 'retrovirus' causes AIDs – claims that were demolished by Berkeley virologist Peter Duesberg who showed that no one had ever proved that HIV causes acquired immunodeficiency syndrome or AIDS. Claims that become accepted as fact, publicly and medically, with no proof whatsoever are an ever-recurring story that profoundly applies to

'Covid'. Nevertheless, despite the lack of proof, Montagnier's team at the Pasteur Institute in Paris had a long dispute with American researcher Robert Gallo over which of them discovered and isolated the HIV 'virus' and with *no evidence* found it to cause AIDS. You will see later that there is also no evidence that any 'virus' causes any disease or that there is even such a thing as a 'virus' in the way it is said to exist. The claim to have 'isolated' the HIV 'virus' will be presented in its real context as we come to the shocking story – and it is a story – of SARS-CoV-2 and so will Montagnier's assertion that he identified the full SARS-CoV-2 genome.

Hoax in the making

We can pick up the 'Covid' story in 2010 and the publication by the Rockefeller Foundation of a document called 'Scenarios for the Future of Technology and International Development'. The inner circle of the Rockefeller family has been serving the Cult since John D. Rockefeller (1839-1937) made his fortune with Standard Oil. It is less well known that the same Rockefeller – the Bill Gates of his day – was responsible for establishing what is now referred to as 'Big Pharma', the global network of pharmaceutical companies that make outrageous profits dispensing scalpel and drug 'medicine' and are obsessed with pumping vaccines in ever-increasing number into as many human arms and backsides as possible. John D. Rockefeller was the driving force behind the creation of the 'education' system in the United States and elsewhere specifically designed to program the perceptions of generations thereafter. The Rockefeller family donated exceptionally valuable land in New York for the United Nations building and were central in establishing the World Health Organization in 1948 as an agency of the UN which was created from the start as a Trojan horse and stalking horse for world government. Now enter Bill Gates. His family and the Rockefellers have long been extremely close and I have seen genealogy which claims that if you go back far enough the two families fuse into the same bloodline. Gates has said that the Bill and Melinda Gates Foundation was inspired by the Rockefeller Foundation and why not

when both are serving the same Cult? Major tax-exempt foundations are overwhelmingly criminal enterprises in which Cult assets fund the Cult agenda in the guise of 'philanthropy' while avoiding tax in the process. Cult operatives can become mega-rich in their role of front men and women for the psychopaths at the inner core and they, too, have to be psychopaths to knowingly serve such evil. Part of the deal is that a big percentage of the wealth gleaned from representing the Cult has to be spent advancing the ambitions of the Cult and hence you have the Rockefeller Foundation, Bill and Melinda Gates Foundation (and *so* many more) and people like George Soros with his global Open Society Foundations spending their billions in pursuit of global Cult control. Gates is a global public face of the Cult with his interventions in world affairs including Big Tech influence; a central role in the 'Covid' and 'vaccine' scam; promotion of the climate change shakedown; manipulation of education; geoengineering of the skies; and his food-control agenda as the biggest owner of farmland in America, his GMO promotion and through other means. As one writer said: 'Gates monopolizes or wields disproportionate influence over the tech industry, global health and vaccines, agriculture and food policy (including biopiracy and fake food), weather modification and other climate technologies, surveillance, education and media.' The almost limitless wealth secured through Microsoft and other not-allowed-to-fail ventures (including vaccines) has been ploughed into a long, long list of Cult projects designed to enslave the entire human race. Gates and the Rockefellers have been working as one unit with the Rockefeller-established World Health Organization leading global 'Covid' policy controlled by Gates through his mouth-piece Tedros. Gates became the WHO's biggest funder when Trump announced that the American government would cease its donations, but Biden immediately said he would restore the money when he took office in January, 2021. The Gates Foundation (the Cult) owns through limitless funding the world health system and the major players across the globe in the 'Covid' hoax.

Okay, with that background we return to that Rockefeller Foundation document of 2010 headed 'Scenarios for the Future of Technology and International Development' and its 'imaginary' epidemic of a virulent and deadly influenza strain which infected 20 percent of the global population and killed eight million in seven months. The Rockefeller scenario was that the epidemic destroyed economies, closed shops, offices and other businesses and led to governments imposing fierce rules and restrictions that included mandatory wearing of face masks and body-temperature checks to enter communal spaces like railway stations and supermarkets. The document predicted that even after the height of the Rockefeller-envisaged epidemic the authoritarian rule would continue to deal with further pandemics, transnational terrorism, environmental crises and rising poverty. Now you may think that the Rockefellers are our modern-day seers or alternatively, and rather more likely, that they well knew what was planned a few years further on. Fascism had to be imposed, you see, to 'protect citizens from risk and exposure'. The Rockefeller scenario document said:

During the pandemic, national leaders around the world flexed their authority and imposed airtight rules and restrictions, from the mandatory wearing of face masks to body-temperature checks at the entries to communal spaces like train stations and supermarkets. Even after the pandemic faded, this more authoritarian control and oversight of citizens and their activities stuck and even intensified. In order to protect themselves from the spread of increasingly global problems – from pandemics and transnational terrorism to environmental crises and rising poverty – leaders around the world took a firmer grip on power.

At first, the notion of a more controlled world gained wide acceptance and approval. Citizens willingly gave up some of their sovereignty – and their privacy – to more paternalistic states in exchange for greater safety and stability. Citizens were more tolerant, and even eager, for top-down direction and oversight, and national leaders had more latitude to impose order in the ways they saw fit.

In developed countries, this heightened oversight took many forms: biometric IDs for all citizens, for example, and tighter regulation of key industries whose stability was deemed vital to national interests. In many developed countries, enforced cooperation with a suite of new regulations and agreements slowly but steadily restored both order and, importantly, economic growth.

There we have the prophetic Rockefellers in 2010 and three years later came their paper for the Global Health Summit in Beijing, China, when government representatives, the private sector, international organisations and groups met to discuss the next 100 years of 'global health'. The Rockefeller Foundation-funded paper was called 'Dreaming the Future of Health for the Next 100 Years and more prophecy ensued as it described a dystopian future: 'The abundance of data, digitally tracking and linking people may mean the 'death of privacy' and may replace physical interaction with transient, virtual connection, generating isolation and raising questions of how values are shaped in virtual networks.' Next in the 'Covid' hoax preparation sequence came a 'table top' simulation in 2018 for another 'imaginary' pandemic of a disease called Clade X which was said to kill 900 million people. The exercise was organised by the Gates-funded Johns Hopkins University's Center for Health Security in the United States and this is the very same university that has been compiling the disgustingly and systematically erroneous global figures for 'Covid' cases and deaths. Similar Johns Hopkins health crisis scenarios have included the Dark Winter exercise in 2001 and Atlantic Storm in 2005.

Nostradamus 201

For sheer predictive genius look no further prophecy-watchers than the Bill Gates-funded Event 201 held only six weeks before the 'coronavirus pandemic' is supposed to have broken out in China and Event 201 was based on a scenario of a global 'coronavirus pandemic'. Melinda Gates, the great man's missus, told the BBC that he had 'prepared for years' for a coronavirus pandemic which told us what we already knew. Nostradamugates had predicted in a TED talk in 2015 that a pandemic was coming that would kill a lot of people and demolish the world economy. My god, the man is a machine – possibly even literally. Now here he was only weeks before the real thing funding just such a simulated scenario and involving his friends and associates at Johns Hopkins, the World Economic Forum Cult-front of Klaus Schwab, the United Nations,

Johnson & Johnson, major banks, and officials from China and the Centers for Disease Control in the United States. What synchronicity – Johns Hopkins would go on to compile the fraudulent 'Covid' figures, the World Economic Forum and Schwab would push the 'Great Reset' in response to 'Covid', the Centers for Disease Control would be at the forefront of 'Covid' policy in the United States, Johnson & Johnson would produce a 'Covid vaccine', and everything would officially start just weeks later in China. Spooky, eh? They were even accurate in creating a simulation of a 'virus' pandemic because the 'real thing' would also be a simulation. Event 201 was not an exercise preparing for something that might happen; it was a rehearsal for what those in control knew was *going* to happen and very shortly. Hours of this simulation were posted on the Internet and the various themes and responses mirrored what would soon be imposed to transform human society. News stories were inserted and what they said would be commonplace a few weeks later with still more prophecy perfection. Much discussion focused on the need to deal with misinformation and the 'anti-vax movement' which is exactly what happened when the 'virus' arrived – was said to have arrived – in the West.

Cult-owned social media banned criticism and exposure of the official 'virus' narrative and when I said there *was* no 'virus' in early April, 2020, I was banned by one platform after another including YouTube, Facebook and later Twitter. The mainstream broadcast media in Britain was in effect banned from interviewing me by the Tony-Blair-created government broadcasting censor Ofcom headed by career government bureaucrat Melanie Dawes who was appointed just as the 'virus' hoax was about to play out in January, 2020. At the same time the Ickonic media platform was using Vimeo, another ultra-Zionist-owned operation, while our own player was being created and they deleted in an instant hundreds of videos, documentaries, series and shows to confirm their unbelievable vindictiveness. We had copies, of course, and they had to be restored one by one when our player was ready. These people have no class. Sabbatian Facebook promised free advertisements for the Gates-

controlled World Health Organization narrative while deleting 'false claims and conspiracy theories' to stop 'misinformation' about the alleged coronavirus. All these responses could be seen just a short while earlier in the scenarios of Event 201. Extreme censorship was absolutely crucial for the Cult because the official story was so ridiculous and unsupportable by the evidence that it could never survive open debate and the free-flow of information and opinion. If you can't win a debate then don't have one is the Cult's approach throughout history. Facebook's little boy front man – front boy – Mark Zuckerberg equated 'credible and accurate information' with official sources and exposing their lies with 'misinformation'.

Silencing those that can see

The censorship dynamic of Event 201 is now the norm with an army of narrative-supporting 'fact-checker' organisations whose entire reason for being is to tell the public that official narratives are true and those exposing them are lying. One of the most appalling of these 'fact-checkers' is called NewsGuard founded by ultra-Zionist Americans Gordon Crovitz and Steven Brill. Crovitz is a former publisher of *The Wall Street Journal*, former Executive Vice President of Dow Jones, a member of the Council on Foreign Relations (CFR), and on the board of the American Association of Rhodes Scholars. The CFR and Rhodes Scholarships, named after Rothschild agent Cecil Rhodes who plundered the gold and diamonds of South Africa for his masters and the Cult, have featured widely in my books. NewsGuard don't seem to like me for some reason – I really can't think why – and they have done all they can to have me censored and discredited which is, to quote an old British politician, like being savaged by a dead sheep. They are, however, like all in the censorship network, very well connected and funded by organisations themselves funded by, or connected to, Bill Gates. As you would expect with anything associated with Gates NewsGuard has an offshoot called HealthGuard which 'fights online health care hoaxes'. How very kind. Somehow the NewsGuard European Managing Director Anna-Sophie Harling, a remarkably young-

looking woman with no broadcasting experience and little hands-on work in journalism, has somehow secured a position on the 'Content Board' of UK government broadcast censor Ofcom. An executive of an organisation seeking to discredit dissidents of the official narratives is making decisions for the government broadcast 'regulator' about content?? Another appalling 'fact-checker' is Full Fact funded by George Soros and global censors Google and Facebook.

It's amazing how many activists in the 'fact-checking', 'anti-hate', arena turn up in government-related positions – people like UK Labour Party activist Imran Ahmed who heads the Center for Countering Digital Hate founded by people like Morgan McSweeney, now chief of staff to the Labour Party's hapless and useless 'leader' Keir Starmer. Digital Hate – which is what it really is – uses the American spelling of Center to betray its connection to a transatlantic network of similar organisations which in 2020 shapeshifted from attacking people for 'hate' to attacking them for questioning the 'Covid' hoax and the dangers of the 'Covid vaccine'. It's just a coincidence, you understand. This is one of Imran Ahmed's hysterical statements: 'I would go beyond calling anti-vaxxers conspiracy theorists to say they are an extremist group that pose a national security risk.' No one could ever accuse this prat of understatement and he's including in that those parents who are now against vaccines after their children were damaged for life or killed by them. He's such a nice man. Ahmed does the rounds of the Woke media getting soft-ball questions from spineless 'journalists' who never ask what right he has to campaign to destroy the freedom of speech of others while he demands it for himself. There also seems to be an overrepresentation in Ofcom of people connected to the narrative-worshipping BBC. This incredible global network of narrative-support was super-vital when the 'Covid' hoax was played in the light of the mega-whopper lies that have to be defended from the spotlight cast by the most basic intelligence.

Setting the scene

The Cult plays the long game and proceeds step-by-step ensuring that everything is in place before major cards are played and they don't come any bigger than the 'Covid' hoax. The psychopaths can't handle events where the outcome isn't certain and as little as possible – preferably nothing – is left to chance. Politicians, government and medical officials who would follow direction were brought to illusory power in advance by the Cult web whether on the national stage or others like state governors and mayors of America. For decades the dynamic between officialdom, law enforcement and the public was changed from one of service to one of control and dictatorship. Behaviour manipulation networks established within government were waiting to impose the coming 'Covid' rules and regulations specifically designed to subdue and rewire the psyche of the people in the guise of protecting health. These included in the UK the Behavioural Insights Team part-owned by the British government Cabinet Office; the Scientific Pandemic Insights Group on Behaviours (SPI-B); and a whole web of intelligence and military groups seeking to direct the conversation on social media and control the narrative. Among them are the cyberwarfare (on the people) 77th Brigade of the British military which is also coordinated through the Cabinet Office as civilian and military leadership continues to combine in what they call the Fusion Doctrine. The 77th Brigade is a British equivalent of the infamous Israeli (Sabbatian) military cyberwarfare and Internet manipulation operation Unit 8200 which I expose at length in *The Trigger*. Also carefully in place were the medical and science advisers to government – many on the payroll past or present of Bill Gates – and a whole alternative structure of unelected government stood by to take control when elected parliaments were effectively closed down once the 'Covid' card was slammed on the table. The structure I have described here and so much more was installed in every major country through the Cult networks. The top-down control hierarchy looks like this: The Cult – Cult-owned Gates – the World Health Organization and Tedros – Gates-funded or controlled chief medical officers and science 'advisers' (dictators) in each country –

political 'leaders'– law enforcement – The People. Through this simple global communication and enforcement structure the policy of the Cult could be imposed on virtually the entire human population so long as they acquiesced to the fascism. With everything in place it was time for the button to be pressed in late 2019/early 2020.

These were the prime goals the Cult had to secure for its will to prevail:

1) Locking down economies, closing all but designated 'essential' businesses (Cult-owned corporations were 'essential'), and putting the population under house arrest was an imperative to destroy independent income and employment and ensure dependency on the Cult-controlled state in the Hunger Games Society. Lockdowns had to be established as the global blueprint from the start to respond to the 'virus' and followed by pretty much the entire world.

2) The global population had to be terrified into believing in a deadly 'virus' that didn't actually exist so they would unquestioningly obey authority in the belief that authority must know how best to protect them and their families. Software salesman Gates would suddenly morph into the world's health expert and be promoted as such by the Cult-owned media.

3) A method of testing that wasn't testing for the 'virus', but was only claimed to be, had to be in place to provide the illusion of 'cases' and subsequent 'deaths' that had a very different cause to the 'Covid-19' that would be scribbled on the death certificate.

4) Because there was no 'virus' and the great majority testing positive with a test not testing for the 'virus' would have no symptoms of anything the lie had to be sold that people without symptoms (without the 'virus') could still pass it on to others. This was crucial to justify for the first time quarantining – house arresting – healthy people. Without this the economy-destroying lockdown of *everybody* could not have been credibly sold.

5) The 'saviour' had to be seen as a vaccine which beyond evil drug companies were working like angels of mercy to develop as quickly as possible, with all corners cut, to save the day. The public must absolutely not know that the 'vaccine' had nothing to do with a 'virus' or that the contents were ready and waiting with a very different motive long before the 'Covid' card was even lifted from the pack.

I said in March, 2020, that the 'vaccine' would have been created way ahead of the 'Covid' hoax which justified its use and the following December an article in the New York *Intelligencer* magazine said the Moderna 'vaccine' had been 'designed' by

January, 2020. This was 'before China had even acknowledged that the disease could be transmitted from human to human, more than a week before the first confirmed coronavirus case in the United States'. The article said that by the time the first American death was announced a month later 'the vaccine had already been manufactured and shipped to the National Institutes of Health for the beginning of its Phase I clinical trial'. The 'vaccine' was actually 'designed' long before that although even with this timescale you would expect the article to ask how on earth it could have been done that quickly. Instead it asked why the 'vaccine' had not been rolled out then and not months later. Journalism in the mainstream is truly dead. I am going to detail in the next chapter why the 'virus' has never existed and how a hoax on that scale was possible, but first the foundation on which the Big Lie of 'Covid' was built.

The test that doesn't test

Fraudulent 'testing' is the bottom line of the whole 'Covid' hoax and was the means by which a 'virus' that did not exist *appeared* to exist. They could only achieve this magic trick by using a test not testing for the 'virus'. To use a test that *was* testing for the 'virus' would mean that every test would come back negative given there was no 'virus'. They chose to exploit something called the RT-PCR test invented by American biochemist Kary Mullis in the 1980s who said publicly that his PCR test … *cannot detect infectious disease*. Yes, the 'test' used worldwide to detect infectious 'Covid' to produce all the illusory 'cases' and 'deaths' compiled by Johns Hopkins and others *cannot detect infectious disease*. This fact came from the mouth of the man who invented PCR and was awarded the Nobel Prize in Chemistry in 1993 for doing so. Sadly, and incredibly conveniently for the Cult, Mullis died in August, 2019, at the age of 74 just before his test would be fraudulently used to unleash fascism on the world. He was said to have died from pneumonia which was an irony in itself. A few months later he would have had 'Covid-19' on his death certificate. I say the timing of his death was convenient because had he lived Mullis, a brilliant, honest and decent man, would have been

vociferously speaking out against the use of his test to detect 'Covid' when it was never designed, or able, to do that. I know that to be true given that Mullis made the same point when his test was used to 'detect' – not detect – HIV. He had been seriously critical of the Gallo/Montagnier claim to have isolated the HIV 'virus' and shown it to cause AIDS for which Mullis said there was no evidence. AIDS is actually not a disease but a series of diseases from which people die all the time. When they die from those *same diseases* after a positive 'test' for HIV then AIDS goes on their death certificate. I think I've heard that before somewhere. Countries instigated a policy with 'Covid' that anyone who tested positive with a test not testing for the 'virus' and died of any other cause within 28 days and even longer 'Covid-19' had to go on the death certificate. Cases have come from the test that can't test for infectious disease and the deaths are those who have died of *anything* after testing positive with a test not testing for the 'virus'. I'll have much more later about the death certificate scandal.

Mullis was deeply dismissive of the now US 'Covid' star Anthony Fauci who he said was a liar who didn't know anything about anything – 'and I would say that to his face – nothing.' He said of Fauci: 'The man thinks he can take a blood sample, put it in an electron microscope and if it's got a virus in there you'll know it – he doesn't understand electron microscopy and he doesn't understand medicine and shouldn't be in a position like he's in.' That position, terrifyingly, has made him the decider of 'Covid' fascism policy on behalf of the Cult in his role as director since 1984 of the National Institute of Allergy and Infectious Diseases (NIAID) while his record of being wrong is laughable; but being wrong, so long as it's the *right kind* of wrong, is why the Cult loves him. He'll say anything the Cult tells him to say. Fauci was made Chief Medical Adviser to the President immediately Biden took office. Biden was installed in the White House by Cult manipulation and one of his first decisions was to elevate Fauci to a position of even more control. This is a coincidence? Yes, and I identify as a flamenco dancer called Lola. How does such an incompetent criminal like Fauci remain in that

pivotal position in American health since *the 1980s*? When you serve the Cult it looks after you until you are surplus to requirements. Kary Mullis said prophetically of Fauci and his like: 'Those guys have an agenda and it's not an agenda we would like them to have … they make their own rules, they change them when they want to, and Tony Fauci does not mind going on television in front of the people who pay his salary and lie directly into the camera.' Fauci has done that almost daily since the 'Covid' hoax began. Lying is in Fauci's DNA. To make the situation crystal clear about the PCR test this is a direct quote from its inventor Kary Mullis:

> It [the PCR test] doesn't tell you that you're sick and doesn't tell you that the thing you ended up with was really going to hurt you ...'

Ask yourself why governments and medical systems the world over have been using this very test to decide who is 'infected' with the SARS-CoV-2 'virus' and the alleged disease it allegedly causes, 'Covid-19'. The answer to that question will tell you what has been going on. By the way, here's a little show-stopper – the 'new' SARS-CoV-2 'virus' was 'identified' as such right from the start using … *the PCR test not testing for the 'virus'*. If you are new to this and find that shocking then stick around. I have hardly started yet. Even worse, other 'tests', like the 'Lateral Flow Device' (LFD), are considered so useless that they have to be *confirmed* by the PCR test! Leaked emails written by Ben Dyson, adviser to UK 'Health' Secretary Matt Hancock, said they were 'dangerously unreliable'. Dyson, executive director of strategy at the Department of Health, wrote: 'As of today, someone who gets a positive LFD result in (say) London has at best a 25 per cent chance of it being a true positive, but if it is a self-reported test potentially as low as 10 per cent (on an optimistic assumption about specificity) or as low as 2 per cent (on a more pessimistic assumption).' These are the 'tests' that schoolchildren and the public are being urged to have twice a week or more and have to isolate if they get a positive. Each fake positive goes in the statistics as a 'case' no matter how ludicrously inaccurate and the

'cases' drive lockdown, masks and the pressure to 'vaccinate'. The government said in response to the email leak that the 'tests' were accurate which confirmed yet again what shocking bloody liars they are. The real false positive rate is *100 percent* as we'll see. In another 'you couldn't make it up' the UK government agreed to pay £2.8 billion to California's Innova Medical Group to supply the irrelevant lateral flow tests. The company's primary test-making centre is in China. Innova Medical Group, established in March, 2020, is owned by Pasaca Capital Inc, chaired by Chinese-American millionaire Charles Huang who was born in Wuhan.

How it works – and how it doesn't

The RT-PCR test, known by its full title of Polymerase chain reaction, is used across the world to make millions, even billions, of copies of a DNA/RNA genetic information sample. The process is called 'amplification' and means that a tiny sample of genetic material is amplified to bring out the detailed content. I stress that it is not testing for an infectious disease. It is simply amplifying a sample of genetic material. In the words of Kary Mullis: 'PCR is … just a process that's used to make a whole lot of something out of something.' To emphasise the point companies that make the PCR tests circulated around the world to 'test' for 'Covid' warn on the box that it can't be used to detect 'Covid' or infectious disease and is for research purposes only. It's okay, rest for a minute and you'll be fine. This is the test that produces the 'cases' and 'deaths' that have been used to destroy human society. All those global and national medical and scientific 'experts' demanding this destruction to 'save us' *KNOW* that the test is not testing for the 'virus' and the cases and deaths they claim to be real are an almost unimaginable fraud. Every one of them and so many others including politicians and psychopaths like Gates and Tedros must be brought before Nuremburg-type trials and jailed for the rest of their lives. The more the genetic sample is amplified by PCR the more elements of that material become sensitive to the test and by that I don't mean sensitive for a 'virus' but for elements of the genetic material which

is *naturally* in the body or relates to remnants of old conditions of various kinds lying dormant and causing no disease. Once the amplification of the PCR reaches a certain level *everyone* will test positive. So much of the material has been made sensitive to the test that everyone will have some part of it in their body. Even lying criminals like Fauci have said that once PCR amplifications pass 35 cycles everything will be a false positive that cannot be trusted for the reasons I have described. I say, like many proper doctors and scientists, that 100 percent of the 'positives' are false, but let's just go with Fauci for a moment.

He says that any amplification over 35 cycles will produce false positives and yet the US Centers for Disease Control (CDC) and Food and Drug Administration (FDA) have recommended up to *40 cycles* and the National Health Service (NHS) in Britain admitted in an internal document for staff that it was using *45 cycles* of amplification. A long list of other countries has been doing the same and at least one 'testing' laboratory has been using *50 cycles*. Have you ever heard a doctor, medical 'expert' or the media ask what level of amplification has been used to claim a 'positive'. The 'test' comes back 'positive' and so you have the 'virus', end of story. Now we can see how the government in Tanzania could send off samples from a goat and a pawpaw fruit under human names and both came back positive for 'Covid-19'. Tanzania president John Magufuli mocked the 'Covid' hysteria, the PCR test and masks and refused to import the DNA-manipulating 'vaccine'. The Cult hated him and an article sponsored by the Bill Gates Foundation appeared in the London *Guardian* in February, 2021, headed 'It's time for Africa to rein in Tanzania's anti-vaxxer president'. Well, 'reined in' he shortly was. Magufuli appeared in good health, but then, in March, 2021, he was dead at 61 from 'heart failure'. He was replaced by Samia Hassan Suhulu who is connected to Klaus Schwab's World Economic Forum and she immediately reversed Magufuli's 'Covid' policy. A sample of cola tested positive for 'Covid' with the PCR test in Germany while American actress and singer-songwriter Erykah Badu tested positive in one nostril and negative in the other. Footballer Ronaldo called

the PCR test 'bullshit' after testing positive three times and being forced to quarantine and miss matches when there was nothing wrong with him. The mantra from Tedros at the World Health Organization and national governments (same thing) has been test, test, test. They know that the more tests they can generate the more fake 'cases' they have which go on to become 'deaths' in ways I am coming to. The UK government has its Operation Moonshot planned to test multiple millions every day in workplaces and schools with free tests for everyone to use twice a week at home in line with the Cult plan from the start to make testing part of life. A government advertisement for an 'Interim Head of Asymptomatic Testing Communication' said the job included responsibility for delivering a 'communications strategy' (propaganda) 'to support the expansion of asymptomatic testing that *'normalises testing as part of everyday life*'. More tests means more fake 'cases', 'deaths' and fascism. I have heard of, and from, many people who booked a test, couldn't turn up, and yet got a positive result through the post for a test they'd never even had. The whole thing is crazy, but for the Cult there's method in the madness. Controlling and manipulating the level of amplification of the test means the authorities can control whenever they want the number of apparent 'cases' and 'deaths'. If they want to justify more fascist lockdown and destruction of livelihoods they keep the amplification high. If they want to give the illusion that lockdowns and the 'vaccine' are working then they lower the amplification and 'cases' and 'deaths' will appear to fall. In January, 2021, the Cult-owned World Health Organization suddenly warned laboratories about over-amplification of the test and to lower the threshold. Suddenly headlines began appearing such as: 'Why ARE "Covid" cases plummeting?' This was just when the vaccine rollout was underway and I had predicted months before they would make cases appear to fall through amplification tampering when the 'vaccine' came. These people are so predictable.

Cow vaccines?

The question must be asked of what is on the test swabs being poked far up the nose of the population to the base of the brain? A nasal swab punctured one woman's brain and caused it to leak fluid. Most of these procedures are being done by people with little training or medical knowledge. Dr Lorraine Day, former orthopaedic trauma surgeon and Chief of Orthopaedic Surgery at San Francisco General Hospital, says the tests are really a *'vaccine'*. Cows have long been vaccinated this way. She points out that masks have to cover the nose and the mouth where it is claimed the 'virus' exists in saliva. Why then don't they take saliva from the mouth as they do with a DNA test instead of pushing a long swab up the nose towards the brain? The ethmoid bone separates the nasal cavity from the brain and within that bone is the cribriform plate. Dr Day says that when the swab is pushed up against this plate and twisted the procedure is 'depositing things back there'. She claims that among these 'things' are nanoparticles that can enter the brain. Researchers have noted that a team at the Gates-funded Johns Hopkins have designed tiny, star-shaped micro-devices that can latch onto intestinal mucosa and release drugs into the body. Mucosa is the thin skin that covers the inside surface of parts of the body such as *the nose* and mouth and produces mucus to protect them. The Johns Hopkins micro-devices are called 'theragrippers' and were 'inspired' by a parasitic worm that digs its sharp teeth into a host's intestines. Nasal swabs are also coated in the sterilisation agent ethylene oxide. The US National Cancer Institute posts this explanation on its website:

> At room temperature, ethylene oxide is a flammable colorless gas with a sweet odor. It is used primarily to produce other chemicals, including antifreeze. In smaller amounts, ethylene oxide is used as a pesticide and a sterilizing agent. The ability of ethylene oxide to damage DNA makes it an effective sterilizing agent but also accounts for its cancer-causing activity.

The Institute mentions lymphoma and leukaemia as cancers most frequently reported to be associated with occupational exposure to ethylene oxide along with stomach and breast cancers. How does anyone think this is going to work out with the constant testing

regime being inflicted on adults and children at home and at school that will accumulate in the body anything that's on the swab?

Doctors know best

It is vital for people to realise that 'hero' doctors 'know' only what the Big Pharma-dominated medical authorities tell them to 'know' and if they refuse to 'know' what they are told to 'know' they are out the door. They are mostly not physicians or healers, but repeaters of the official narrative – or else. I have seen alleged professional doctors on British television make shocking statements that we are supposed to take seriously. One called 'Dr' Amir Khan, who is actually telling patients how to respond to illness, said that men could take the birth pill to 'help slow down the effects of Covid-19'. In March, 2021, another ridiculous 'Covid study' by an American doctor proposed injecting men with the female sex hormone progesterone as a 'Covid' treatment. British doctor Nighat Arif told the BBC that face coverings were now going to be part of ongoing normal. Yes, the vaccine protects you, she said (evidence?) … but the way to deal with viruses in the community was always going to come down to hand washing, face covering and keeping a physical distance. That's not what we were told before the 'vaccine' was circulating. Arif said she couldn't imagine ever again going on the underground or in a lift without a mask. I was just thanking my good luck that she was not my doctor when she said – in March, 2021 – that if 'we are *behaving* and we are doing all the right things' she thought we could 'have our nearest and dearest around us at home … around *Christmas* and N*ew Year!* Her patronising delivery was the usual school teacher talking to six-year-olds as she repeated every government talking point and probably believed them all. If we have learned anything from the 'Covid' experience surely it must be that humanity's perception of doctors needs a fundamental rethink. NHS 'doctor' Sara Kayat told her television audience that the 'Covid vaccine' would '100 percent prevent hospitalisation and death'. Not even Big Pharma claimed that. We have to stop taking 'experts' at their word without question when so many of them are

clueless and only repeating the party line on which their careers depend. That is not to say there are not brilliants doctors – there are and I have spoken to many of them since all this began – but you won't see them in the mainstream media or quoted by the psychopaths and yes-people in government.

Remember the name – Christian Drosten

German virologist Christian Drosten, Director of Charité Institute of Virology in Berlin, became a national star after the pandemic hoax began. He was feted on television and advised the German government on 'Covid' policy. Most importantly to the wider world Drosten led a group that produced the 'Covid' testing protocol for the PCR test. What a remarkable feat given the PCR cannot test for infectious disease and even more so when you think that Drosten said that his method of testing for SARS-CoV-2 was developed 'without having virus material available'. *He developed a test for a 'virus' that he didn't have and had never seen*. Let that sink in as you survey the global devastation that came from what he did. The whole catastrophe of Drosten's 'test' was based on the alleged genetic sequence published by Chinese scientists on the Internet. We will see in the next chapter that this alleged 'genetic sequence' has never been produced by China or anyone and cannot be when there *is no* SARS-CoV-2. Drosten, however, doesn't seem to let little details like that get in the way. He was the lead author with Victor Corman from the same Charité Hospital of the paper 'Detection of 2019 novel coronavirus (2019-nCoV) by real-time PCR' published in a magazine called *Eurosurveillance*. This became known as the Corman-Drosten paper. In November, 2020, with human society devastated by the effects of the Corman-Drosten test baloney, the protocol was publicly challenged by 22 international scientists and independent researchers from Europe, the United States, and Japan. Among them were senior molecular geneticists, biochemists, immunologists, and microbiologists. They produced a document headed 'External peer review of the RTPCR test to detect SARS-Cov-2 Reveals 10 Major Flaws At The Molecular and Methodological Level: Consequences

For False-Positive Results'. The flaws in the Corman-Drosten test included the following:

- The test is non-specific because of erroneous design
- Results are enormously variable
- The test is unable to discriminate between the whole 'virus' and viral fragments
- It doesn't have positive or negative controls
- The test lacks a standard operating procedure
- It is unsupported by proper peer view

The scientists said the PCR 'Covid' testing protocol was not founded on science and they demanded the Corman-Drosten paper be retracted by *Eurosurveillance*. They said all present and previous Covid deaths, cases, and 'infection rates' should be subject to a massive retroactive inquiry. Lockdowns and travel restrictions should be reviewed and relaxed and those diagnosed through PCR to have 'Covid-19' should not be forced to isolate. Dr Kevin Corbett, a health researcher and nurse educator with a long academic career producing a stream of peer-reviewed publications at many UK universities, made the same point about the PCR test debacle. He said of the scientists' conclusions: 'Every scientific rationale for the development of that test has been totally destroyed by this paper. It's like Hiroshima/Nagasaki to the Covid test.' He said that China hadn't given them an isolated 'virus' when Drosten developed the test. Instead they had developed the test from *a sequence in a gene bank*.' Put another way … *they made it up*! The scientists were supported in this contention by a Portuguese appeals court which ruled in November, 2020, that PCR tests are unreliable and it is unlawful to quarantine people based solely on a PCR test. The point about China not providing an isolated virus must be true when the 'virus' has never been isolated to this day and the consequences of that will become clear. Drosten and company produced this useless 'protocol' right on cue in January, 2020, just as the 'virus' was said to

be moving westward and it somehow managed to successfully pass a peer-review in 24 hours. In other words there was no peer-review for a test that would be used to decide who had 'Covid' and who didn't across the world. The Cult-created, Gates-controlled World Health Organization immediately recommended all its nearly 200 member countries to use the Drosten PCR protocol to detect 'cases' and 'deaths'. The sting was underway and it continues to this day.

So who is this Christian Drosten that produced the means through which death, destruction and economic catastrophe would be justified? His education background, including his doctoral thesis, would appear to be somewhat shrouded in mystery and his track record is dire as with another essential player in the 'Covid' hoax, the Gates-funded Professor Neil Ferguson at the Gates-funded Imperial College in London of whom more shortly. Drosten predicted in 2003 that the alleged original SARS 'virus' (SARS-1') was an epidemic that could have serious effects on economies and an effective vaccine would take at least two years to produce. Drosten's answer to every alleged 'outbreak' is a vaccine which you won't be shocked to know. What followed were just 774 official deaths worldwide and none in Germany where there were only nine cases. That is even if you believe there ever was a SARS 'virus' when the evidence is zilch and I will expand on this in the next chapter. Drosten claims to be co-discoverer of 'SARS-1' and developed a test for it in 2003. He was screaming warnings about 'swine flu' in 2009 and how it was a widespread infection far more severe than any dangers from a vaccine could be and people should get vaccinated. It would be helpful for Drosten's vocal chords if he simply recorded the words 'the virus is deadly and you need to get vaccinated' and copies could be handed out whenever the latest made-up threat comes along. Drosten's swine flu epidemic never happened, but Big Pharma didn't mind with governments spending hundreds of millions on vaccines that hardly anyone bothered to use and many who did wished they hadn't. A study in 2010 revealed that the risk of dying from swine flu, or H1N1, was no higher than that of the annual seasonal flu which is what at least most of 'it' really was as in

the case of 'Covid-19'. A media investigation into Drosten asked how with such a record of inaccuracy he could be *the* government adviser on these issues. The answer to that question is the same with Drosten, Ferguson and Fauci – they keep on giving the authorities the 'conclusions' and 'advice' they want to hear. Drosten certainly produced the goods for them in January, 2020, with his PCR protocol garbage and provided the foundation of what German internal medicine specialist Dr Claus Köhnlein, co-author of *Virus Mania*, called the 'test pandemic'. The 22 scientists in the *Eurosurveillance* challenge called out conflicts of interest within the Drosten 'protocol' group and with good reason. Olfert Landt, a regular co-author of Drosten 'studies', owns the biotech company TIB Molbiol Syntheselabor GmbH in Berlin which manufactures and sells the tests that Drosten and his mates come up with. They have done this with SARS, Enterotoxigenic E. coli (ETEC), MERS, Zika 'virus', yellow fever, and now 'Covid'. Landt told the *Berliner Zeitung* newspaper:

> The testing, design and development came from the Charité [Drosten and Corman]. We simply implemented it immediately in the form of a kit. And if we don't have the virus, which originally only existed in Wuhan, we can make a synthetic gene to simulate the genome of the virus. That's what we did very quickly.

This is more confirmation that the Drosten test was designed without access to the 'virus' and only a synthetic simulation which is what SARS-CoV-2 really is – a computer-generated synthetic fiction. It's quite an enterprise they have going here. A Drosten team decides what the test for something should be and Landt's biotech company flogs it to governments and medical systems across the world. His company must have made an absolute fortune since the 'Covid' hoax began. Dr Reiner Fuellmich, a prominent German consumer protection trial lawyer in Germany and California, is on Drosten's case and that of Tedros at the World Health Organization for crimes against humanity with a class-action lawsuit being prepared in the United States and other legal action in Germany.

Why China?

Scamming the world with a 'virus' that doesn't exist would seem impossible on the face of it, but not if you have control of the relatively few people that make policy decisions and the great majority of the global media. Remember it's not about changing 'real' reality it's about controlling *perception* of reality. You don't have to make something happen you only have make people *believe* that it's happening. Renegade Minds understand this and are therefore much harder to swindle. 'Covid-19' is not a 'real' 'virus'. It's a mind virus, like a computer virus, which has infected the minds, not the bodies, of billions. It all started, publically at least, in China and that alone is of central significance. The Cult was behind the revolution led by its asset Mao Zedong, or Chairman Mao, which established the People's Republic of China on October 1st, 1949. It should have been called The Cult's Republic of China, but the name had to reflect the recurring illusion that vicious dictatorships are run by and for the people (see all the 'Democratic Republics' controlled by tyrants). In the same way we have the 'Biden' Democratic Republic of America officially ruled by a puppet tyrant (at least temporarily) on behalf of Cult tyrants. The creation of Mao's merciless communist/fascist dictatorship was part of a frenzy of activity by the Cult at the conclusion of World War Two which, like the First World War, it had instigated through its assets in Germany, Britain, France, the United States and elsewhere. Israel was formed in 1948; the Soviet Union expanded its 'Iron Curtain' control, influence and military power with the Warsaw Pact communist alliance in 1955; the United Nations was formed in 1945 as a Cult precursor to world government; and a long list of world bodies would be established including the World Health Organization (1948), World Trade Organization (1948 under another name until 1995), International Monetary Fund (1945) and World Bank (1944). Human society was redrawn and hugely centralised in the global Problem-Reaction-Solution that was World War Two. All these changes were significant. Israel would become the headquarters of the Sabbatians

and the revolution in China would prepare the ground and control system for the events of 2019/2020.

Renegade Minds know there are no borders except for public consumption. The Cult is a seamless, borderless global entity and to understand the game we need to put aside labels like borders, nations, countries, communism, fascism and democracy. These delude the population into believing that countries are ruled within their borders by a government of whatever shade when these are mere agencies of a global power. America's illusion of democracy and China's communism/fascism are subsidiaries – vehicles – for the same agenda. We may hear about conflict and competition between America and China and on the lower levels that will be true; but at the Cult level they are branches of the same company in the way of the McDonald's example I gave earlier. I have tracked in the books over the years support by US governments of both parties for Chinese Communist Party infiltration of American society through allowing the sale of land, even military facilities, and the acquisition of American business and university influence. All this is underpinned by the infamous stealing of intellectual property and technological know-how. Cult-owned Silicon Valley corporations waive their fraudulent 'morality' to do business with human-rights-free China; Cult-controlled Disney has become China's PR department; and China in effect owns 'American' sports such as basketball which depends for much of its income on Chinese audiences. As a result any sports player, coach or official speaking out against China's horrific human rights record is immediately condemned or fired by the China-worshipping National Basketball Association. One of the first acts of China-controlled Biden was to issue an executive order telling federal agencies to stop making references to the 'virus' by the 'geographic location of its origin'. Long-time Congressman Jerry Nadler warned that criticising China, America's biggest rival, leads to hate crimes against Asian people in the United States. So shut up you bigot. China is fast closing in on Israel as a country that must not be criticised which is apt, really, given that Sabbatians control them both. The two countries have

developed close economic, military, technological and strategic ties which include involvement in China's 'Silk Road' transport and economic initiative to connect China with Europe. Israel was the first country in the Middle East to recognise the establishment of Mao's tyranny in 1950 months after it was established.

Project Wuhan – the 'Covid' Psyop

I emphasise again that the Cult plays the long game and what is happening to the world today is the result of centuries of calculated manipulation following a script to take control step-by-step of every aspect of human society. I will discuss later the common force behind all this that has spanned those centuries and thousands of years if the truth be told. Instigating the Mao revolution in China in 1949 with a 2020 'pandemic' in mind is not only how they work – the 71 years between them is really quite short by the Cult's standards of manipulation preparation. The reason for the Cult's Chinese revolution was to create a fiercely-controlled environment within which an extreme structure for human control could be incubated to eventually be unleashed across the world. We have seen this happen since the 'pandemic' emerged from China with the Chinese control-structure founded on AI technology and tyrannical enforcement sweep across the West. Until the moment when the Cult went for broke in the West and put its fascism on public display Western governments had to pay some lip-service to freedom and democracy to not alert too many people to the tyranny-in-the-making. Freedoms were more subtly eroded and power centralised with covert government structures put in place waiting for the arrival of 2020 when that smokescreen of 'freedom' could be dispensed with. The West was not able to move towards tyranny before 2020 anything like as fast as China which was created as a tyranny and had no limits on how fast it could construct the Cult's blueprint for global control. When the time came to impose that structure on the world it was the same Cult-owned Chinese communist/fascist government that provided the excuse – the 'Covid pandemic'. It was absolutely crucial to the Cult plan for the Chinese response to the 'pandemic' –

draconian lockdowns of the entire population – to become the blueprint that Western countries would follow to destroy the livelihoods and freedom of their people. This is why the Cult-owned, Gates-owned, WHO Director-General Tedros said early on:

The Chinese government is to be congratulated for the extraordinary measures it has taken to contain the outbreak. China is actually setting a new standard for outbreak response and it is not an exaggeration.

Forbes magazine said of China: '… those measures protected untold millions from getting the disease'. The Rockefeller Foundation 'epidemic scenario' document in 2010 said 'prophetically':

However, a few countries did fare better – China in particular. The Chinese government's quick imposition and enforcement of mandatory quarantine for all citizens, as well as its instant and near-hermetic sealing off of all borders, saved millions of lives, stopping the spread of the virus far earlier than in other countries and enabling a swifter post-pandemic recovery.

Once again – *spooky*.

The first official story was the 'bat theory' or rather the bat diversion. The source of the 'virus outbreak' we were told was a ''wet market' in Wuhan where bats and other animals are bought and eaten in horrifically unhygienic conditions. Then another story emerged through the alternative media that the 'virus' had been released on purpose or by accident from a BSL-4 (biosafety level 4) laboratory in Wuhan not far from the wet market. The lab was reported to create and work with lethal concoctions and bioweapons. Biosafety level 4 is the highest in the World Health Organization system of safety and containment. Renegade Minds are aware of what I call designer manipulation. The ideal for the Cult is for people to buy its prime narrative which in the opening salvoes of the 'pandemic' was the wet market story. It knows, however, that there is now a considerable worldwide alternative media of researchers sceptical of anything governments say and they are often given a version of events in a form they can perceive as credible while misdirecting them from the real truth. In this case let them

think that the conspiracy involved is a 'bioweapon virus' released from the Wuhan lab to keep them from the real conspiracy – *there is no 'virus'*. The WHO's current position on the source of the outbreak at the time of writing appears to be: 'We haven't got a clue, mate.' This is a good position to maintain mystery and bewilderment. The inner circle will know where the 'virus' came from – *nowhere*. The bottom line was to ensure the public believed there *was* a 'virus' and it didn't much matter if they thought it was natural or had been released from a lab. The belief that there was a 'deadly virus' was all that was needed to trigger global panic and fear. The population was terrified into handing their power to authority and doing what they were told. They had to or they were 'all gonna die'.

In March, 2020, information began to come my way from real doctors and scientists and my own additional research which had my intuition screaming: 'Yes, that's it! *There is no virus*.' The 'bioweapon' was not the 'virus'; it was the *'vaccine'* already being talked about that would be the bioweapon. My conclusion was further enhanced by happenings in Wuhan. The 'virus' was said to be sweeping the city and news footage circulated of people collapsing in the street (which they've never done in the West with the same 'virus'). The Chinese government was building 'new hospitals' in a matter of ten days to 'cope with demand' such was the virulent nature of the 'virus'. Yet in what seemed like no time the 'new hospitals' closed – even if they even opened – and China declared itself 'virus-free'. It was back to business as usual. This was more propaganda to promote the Chinese draconian lockdowns in the West as the way to 'beat the virus'. Trouble was that we subsequently had lockdown after lockdown, but never business as usual. As the people of the West and most of the rest of the world were caught in an ever-worsening spiral of lockdown, social distancing, masks, isolated old people, families forced apart, and livelihood destruction, it was party-time in Wuhan. Pictures emerged of thousands of people enjoying pool parties and concerts. It made no sense until you realised there never was a 'virus' and the

whole thing was a Cult set-up to transform human society out of one its major global strongholds – China.

How is it possible to deceive virtually the entire world population into believing there is a deadly virus when there is not even a 'virus' let alone a deadly one? It's nothing like as difficult as you would think and that's clearly true because it happened.

Postscript: See end of book Postscript for more on the 'Wuhan lab virus release' story which the authorities and media were pushing heavily in the summer of 2021 to divert attention from the truth that the 'Covid virus' is pure invention.

CHAPTER FIVE

There *is no* 'virus'

You can fool some of the people all of the time, and all of the people some of the time, but you cannot fool all of the people all of the time
Abraham Lincoln

The greatest form of mind control is repetition. The more you repeat the same mantra of alleged 'facts' the more will accept them to be true. It becomes an 'everyone knows that, mate'. If you can also censor any other version or alternative to your alleged 'facts' you are pretty much home and cooking.

By the start of 2020 the Cult owned the global mainstream media almost in its entirety to spew out its 'Covid' propaganda and ignore or discredit any other information and view. Cult-owned social media platforms in Cult-owned Silicon Valley were poised and ready to unleash a campaign of ferocious censorship to obliterate all but the official narrative. To complete the circle many demands for censorship by Silicon Valley were led by the mainstream media as 'journalists' became full-out enforcers for the Cult both as propagandists and censors. Part of this has been the influx of young people straight out of university who have become 'journalists' in significant positions. They have no experience and a headful of programmed perceptions from their years at school and university at a time when today's young are the most perceptually-targeted generations in known human history given the insidious impact of technology. They enter the media perceptually prepared and ready to repeat the narratives of the system that programmed them to

repeat its narratives. The BBC has a truly pathetic 'specialist disinformation reporter' called Marianna Spring who fits this bill perfectly. She is clueless about the world, how it works and what is really going on. Her role is to discredit anyone doing the job that a proper journalist would do and system-serving hacks like Spring wouldn't dare to do or even see the need to do. They are too busy licking the arse of authority which can never be wrong and, in the case of the BBC propaganda programme, *Panorama*, contacting payments systems such as PayPal to have a donations page taken down for a film company making documentaries questioning vaccines. Even the BBC soap opera *EastEnders* included a disgracefully biased scene in which an inarticulate white working class woman was made to look foolish for questioning the 'vaccine' while a well-spoken black man and Asian woman promoted the government narrative. It ticked every BBC box and the fact that the black and minority community was resisting the 'vaccine' had nothing to do with the way the scene was written. The BBC has become a disgusting tyrannical propaganda and censorship operation that should be defunded and disbanded and a free media take its place with a brief to stop censorship instead of demanding it. A BBC 'interview' with Gates goes something like: 'Mr Gates, sir, if I can call you sir, would you like to tell our audience why you are such a great man, a wonderful humanitarian philanthropist, and why you should absolutely be allowed as a software salesman to decide health policy for approaching eight billion people? Thank you, sir, please sir.' Propaganda programming has been incessant and merciless and when all you hear is the same story from the media, repeated by those around you who have only heard the same story, is it any wonder that people on a grand scale believe absolute mendacious garbage to be true? You are about to see, too, why this level of information control is necessary when the official 'Covid' narrative is so nonsensical and unsupportable by the evidence.

Structure of Deceit

The pyramid structure through which the 'Covid' hoax has been manifested is very simple and has to be to work. As few people as possible have to be involved with full knowledge of what they are doing – and why – or the real story would get out. At the top of the pyramid are the inner core of the Cult which controls Bill Gates who, in turn, controls the World Health Organization through his pivotal funding and his puppet Director-General mouthpiece, Tedros. Before he was appointed Tedros was chair of the Gates-founded Global Fund to 'fight against AIDS, tuberculosis and malaria', a board member of the Gates-funded 'vaccine alliance' GAVI, and on the board of another Gates-funded organisation. Gates owns him and picked him for a specific reason – Tedros is a crook and worse. 'Dr' Tedros (he's not a medical doctor, the first WHO chief not to be) was a member of the tyrannical Marxist government of Ethiopia for decades with all its human rights abuses. He has faced allegations of corruption and misappropriation of funds and was exposed three times for covering up cholera epidemics while Ethiopia's health minister. Tedros appointed the mass-murdering genocidal Zimbabwe dictator Robert Mugabe as a WHO goodwill ambassador for public health which, as with Tedros, is like appointing a psychopath to run a peace and love campaign. The move was so ridiculous that he had to drop Mugabe in the face of widespread condemnation. American economist David Steinman, a Nobel peace prize nominee, lodged a complaint with the International Criminal Court in The Hague over alleged genocide by Tedros when he was Ethiopia's foreign minister. Steinman says Tedros was a 'crucial decision maker' who directed the actions of Ethiopia's security forces from 2013 to 2015 and one of three officials in charge when those security services embarked on the 'killing' and 'torturing' of Ethiopians. You can see where Tedros is coming from and it's sobering to think that he has been the vehicle for Gates and the Cult to direct the global response to 'Covid'. Think about that. A psychopathic Cult dictates to psychopath Gates who dictates to psychopath Tedros who dictates how countries of the world must respond to a 'Covid virus' never scientifically shown to exist. At the same time psychopathic Cult-owned Silicon Valley information

giants like Google, YouTube, Facebook and Twitter announced very early on that they would give the Cult/Gates/Tedros/WHO version of the narrative free advertising and censor those who challenged their intelligence-insulting, mendacious story.

The next layer in the global 'medical' structure below the Cult, Gates and Tedros are the chief medical officers and science 'advisers' in each of the WHO member countries which means virtually all of them. Medical officers and arbiters of science (they're not) then take the WHO policy and recommended responses and impose them on their country's population while the political 'leaders' say they are deciding policy (they're clearly not) by 'following the science' on the advice of the 'experts' – the same medical officers and science 'advisers' (dictators). In this way with the rarest of exceptions the entire world followed the same policy of lockdown, people distancing, masks and 'vaccines' dictated by the psychopathic Cult, psychopathic Gates and psychopathic Tedros who we are supposed to believe give a damn about the health of the world population they are seeking to enslave. That, amazingly, is all there is to it in terms of crucial decision-making. Medical staff in each country then follow like sheep the dictates of the shepherds at the top of the national medical hierarchies – chief medical officers and science 'advisers' who themselves follow like sheep the shepherds of the World Health Organization and the Cult. Shepherds at the national level often have major funding and other connections to Gates and his Bill and Melinda Gates Foundation which carefully hands out money like confetti at a wedding to control the entire global medical system from the WHO down.

Follow the money

Christopher Whitty, Chief Medical Adviser to the UK Government at the centre of 'virus' policy, a senior adviser to the government's Scientific Advisory Group for Emergencies (SAGE), and Executive Board member of the World Health Organization, was gifted a grant of $40 million by the Bill and Melinda Gates Foundation for malaria research in Africa. The BBC described the unelected Whitty as 'the

official who will probably have the greatest impact on our everyday lives of any individual policymaker in modern times' and so it turned out. What Gates and Tedros have said Whitty has done like his equivalents around the world. Patrick Vallance, co-chair of SAGE and the government's Chief Scientific Adviser, is a former executive of Big Pharma giant GlaxoSmithKline with its fundamental financial and business connections to Bill Gates. In September, 2020, it was revealed that Vallance owned a deferred bonus of shares in GlaxoSmithKline worth £600,000 while the company was 'developing' a 'Covid vaccine'. Move along now – nothing to see here – what could possibly be wrong with that? Imperial College in London, a major player in 'Covid' policy in Britain and elsewhere with its 'Covid-19' Response Team, is funded by Gates and has big connections to China while the now infamous Professor Neil Ferguson, the useless 'computer modeller' at Imperial College is also funded by Gates. Ferguson delivered the dramatically inaccurate excuse for the first lockdowns (much more in the next chapter). The Institute for Health Metrics and Evaluation (IHME) in the United States, another source of outrageously false 'Covid' computer models to justify lockdowns, is bankrolled by Gates who is a vehement promotor of lockdowns. America's version of Whitty and Vallance, the again now infamous Anthony Fauci, has connections to 'Covid vaccine' maker Moderna as does Bill Gates through funding from the Bill and Melinda Gates Foundation. Fauci is director of the National Institute of Allergy and Infectious Diseases (NIAID), a major recipient of Gates money, and they are very close. Deborah Birx who was appointed White House Coronavirus Response Coordinator in February, 2020, is yet another with ties to Gates. Everywhere you look at the different elements around the world behind the coordination and decision making of the 'Covid' hoax there is Bill Gates and his money. They include the World Health Organization; Centers for Disease Control (CDC) in the United States; National Institutes of Health (NIH) of Anthony Fauci; Imperial College and Neil Ferguson; the London School of Hygiene where Chris Whitty worked; Regulatory agencies like the UK Medicines & Healthcare products Regulatory Agency (MHRA)

which gave emergency approval for 'Covid vaccines'; Wellcome Trust; GAVI, the Vaccine Alliance; the Coalition for Epidemic Preparedness Innovations (CEPI); Johns Hopkins University which has compiled the false 'Covid' figures; and the World Economic Forum. A Nationalfile.com article said:

> Gates has a lot of pull in the medical world, he has a multi-million dollar relationship with Dr. Fauci, and Fauci originally took the Gates line supporting vaccines and casting doubt on [the drug hydroxychloroquine]. Coronavirus response team member Dr. Deborah Birx, appointed by former president Obama to serve as United States Global AIDS Coordinator, also sits on the board of a group that has received billions from Gates' foundation, and Birx reportedly used a disputed Bill Gates-funded model for the White House's Coronavirus effort. Gates is a big proponent for a population lockdown scenario for the Coronavirus outbreak.

Another funder of Moderna is the Defense Advanced Research Projects Agency (DARPA), the technology-development arm of the Pentagon and one of the most sinister organisations on earth. DARPA had a major role with the CIA covert technology-funding operation In-Q-Tel in the development of Google and social media which is now at the centre of global censorship. Fauci and Gates are extremely close and openly admit to talking regularly about 'Covid' policy, but then why wouldn't Gates have a seat at every national 'Covid' table after his Foundation committed $1.75 billion to the 'fight against Covid-19'. When passed through our Orwellian Translation Unit this means that he has bought and paid for the Cult-driven 'Covid' response worldwide. Research the major 'Covid' response personnel in your own country and you will find the same Gates funding and other connections again and again. Medical and science chiefs following World Health Organization 'policy' sit atop a medical hierarchy in their country of administrators, doctors and nursing staff. These 'subordinates' are told they must work and behave in accordance with the policy delivered from the 'top' of the national 'health' pyramid which is largely the policy delivered by the WHO which is the policy delivered by Gates and the Cult. The whole 'Covid' narrative has been imposed on medical staff by a climate of fear although great numbers don't even need that to comply. They do so through breathtaking levels of ignorance and

include doctors who go through life simply repeating what Big Pharma and their hierarchical masters tell them to say and believe. No wonder Big Pharma 'medicine' is one of the biggest killers on Planet Earth.

The same top-down system of intimidation operates with regard to the Cult Big Pharma cartel which also dictates policy through national and global medical systems in this way. The Cult and Big Pharma agendas are the same because the former controls and owns the latter. 'Health' administrators, doctors, and nursing staff are told to support and parrot the dictated policy or they will face consequences which can include being fired. How sad it's been to see medical staff meekly repeating and imposing Cult policy without question and most of those who can see through the deceit are only willing to speak anonymously off the record. They know what will happen if their identity is known. This has left the courageous few to expose the lies about the 'virus', face masks, overwhelmed hospitals that aren't, and the dangers of the 'vaccine' that isn't a vaccine. When these medical professionals and scientists, some renowned in their field, have taken to the Internet to expose the truth their articles, comments and videos have been deleted by Cult-owned Facebook, Twitter and YouTube. What a real head-shaker to see YouTube videos with leading world scientists and highly qualified medical specialists with an added link underneath to the notorious Cult propaganda website *Wikipedia* to find the 'facts' about the same subject.

HIV – the 'Covid' trial-run

I'll give you an example of the consequences for health and truth that come from censorship and unquestioning belief in official narratives. The story was told by PCR inventor Kary Mullis in his book *Dancing Naked in the Mind Field*. He said that in 1984 he accepted as just another scientific fact that Luc Montagnier of France's Pasteur Institute and Robert Gallo of America's National Institutes of Health had independently discovered that a 'retrovirus' dubbed HIV (human immunodeficiency virus) caused AIDS. They

were, after all, Mullis writes, specialists in retroviruses. This is how the medical and science pyramids work. Something is announced or *assumed* and then becomes an everybody-knows-that purely through repetition of the assumption as if it is fact. Complete crap becomes accepted truth with no supporting evidence and only repetition of the crap. This is how a 'virus' that doesn't exist became the 'virus' that changed the world. The HIV-AIDS fairy story became a multi-billion pound industry and the media poured out propaganda terrifying the world about the deadly HIV 'virus' that caused the lethal AIDS. By then Mullis was working at a lab in Santa Monica, California, to detect retroviruses with his PCR test in blood donations received by the Red Cross. In doing so he asked a virologist where he could find a reference for HIV being the cause of AIDS. 'You don't need a reference,' the virologist said … *'Everybody knows it.'* Mullis said he wanted to quote a reference in the report he was doing and he said he felt a little funny about not knowing the source of such an important discovery when everyone else seemed to. The virologist suggested he cite a report by the Centers for Disease Control and Prevention (CDC) on morbidity and mortality. Mullis read the report, but it only said that an organism had been identified and did not say how. The report did not identify the original scientific work. Physicians, however, *assumed* (key recurring theme) that if the CDC was convinced that HIV caused AIDS then proof must exist. Mullis continues:

I did computer searches. Neither Montagnier, Gallo, nor anyone else had published papers describing experiments which led to the conclusion that HIV probably caused AIDS. I read the papers in Science for which they had become well known as AIDS doctors, but all they had said there was that they had found evidence of a past infection by something which was probably HIV in some AIDS patients.

They found antibodies. Antibodies to viruses had always been considered evidence of past disease, not present disease. Antibodies signaled that the virus had been defeated. The patient had saved himself. There was no indication in these papers that this virus caused a disease. They didn't show that everybody with the antibodies had the disease. In fact they found some healthy people with antibodies.

Mullis asked why their work had been published if Montagnier and Gallo hadn't really found this evidence, and why had they been fighting so hard to get credit for the discovery? He says he was hesitant to write 'HIV is the probable cause of AIDS' until he found published evidence to support that. 'Tens of thousands of scientists and researchers were spending billions of dollars a year doing research based on this idea,' Mullis writes. 'The reason had to be there somewhere; otherwise these people would not have allowed their research to settle into one narrow channel of investigation.' He said he lectured about PCR at numerous meetings where people were always talking about HIV and he asked them how they knew that HIV was the cause of AIDS:

> Everyone said something. Everyone had the answer at home, in the office, in some drawer. They all knew, and they would send me the papers as soon as they got back. But I never got any papers. Nobody ever sent me the news about how AIDS was caused by HIV.

Eventually Mullis was able to ask Montagnier himself about the reference proof when he lectured in San Diego at the grand opening of the University of California AIDS Research Center. Mullis says this was the last time he would ask his question without showing anger. Montagnier said he should reference the CDC report. 'I read it', Mullis said, and it didn't answer the question. 'If Montagnier didn't know the answer who the hell did?' Then one night Mullis was driving when an interview came on National Public Radio with Peter Duesberg, a prominent virologist at Berkeley and a California Scientist of the Year. Mullis says he finally understood why he could not find references that connected HIV to AIDS – *there weren't any!* No one had ever proved that HIV causes AIDS even though it had spawned a multi-billion pound global industry and the media was repeating this as fact every day in their articles and broadcasts terrifying the shit out of people about AIDS and giving the impression that a positive test for HIV (see 'Covid') was a death sentence. Duesberg was a threat to the AIDS gravy train and the agenda that underpinned it. He was therefore abused and castigated after he told the Proceedings of the National Academy of Sciences

there was no good evidence implicating the new 'virus'. Editors rejected his manuscripts and his research funds were deleted. Mullis points out that the CDC has defined AIDS as one of more than 30 diseases *if accompanied* by a positive result on a test that detects antibodies to HIV; but those same diseases are not defined as AIDS cases when antibodies are not detected:

> If an HIV-positive woman develops uterine cancer, for example, she is considered to have AIDS. If she is not HIV positive, she simply has uterine cancer. An HIV-positive man with tuberculosis has AIDS; if he tests negative he simply has tuberculosis. If he lives in Kenya or Colombia, where the test for HIV antibodies is too expensive, he is simply presumed to have the antibodies and therefore AIDS, and therefore he can be treated in the World Health Organization's clinic. It's the only medical help available in some places. And it's free, because the countries that support WHO are worried about AIDS.

Mullis accuses the CDC of continually adding new diseases (see ever more 'Covid symptoms') to the grand AIDS definition and of virtually doctoring the books to make it appear as if the disease continued to spread. He cites how in 1993 the CDC enormously broadened its AIDS definition and county health authorities were delighted because they received $2,500 per year from the Federal government for every reported AIDS case. Ladies and gentlemen, I have just described, via Kary Mullis, the 'Covid pandemic' of 2020 and beyond. Every element is the same and it's been pulled off in the same way by the same networks.

The 'Covid virus' exists? Okay – prove it. Er … still waiting

What Kary Mullis described with regard to 'HIV' has been repeated with 'Covid'. A claim is made that a new, or 'novel', infection has been found and the entire medical system of the world repeats that as fact exactly as they did with HIV and AIDS. No one in the mainstream asks rather relevant questions such as 'How do you know?' and 'Where is your proof?' The SARS-Cov-2 'virus' and the 'Covid-19 disease' became an overnight 'everybody-knows-that'. The origin could be debated and mulled over, but what you could not suggest was that 'SARS-Cov-2' didn't exist. That would be

ridiculous. 'Everybody knows' the 'virus' exists. Well, I didn't for one along with American proper doctors like Andrew Kaufman and Tom Cowan and long-time American proper journalist Jon Rappaport. We dared to pursue the obvious and simple question: 'Where's the evidence?' The overwhelming majority in medicine, journalism and the general public did not think to ask that. After all, *everyone knew* there was a new 'virus'. Everyone was saying so and I heard it on the BBC. Some would eventually argue that the 'deadly virus' was nothing like as deadly as claimed, but few would venture into the realms of its very existence. Had they done so they would have found that the evidence for that claim had gone AWOL as with HIV causes AIDS. In fact, not even that. For something to go AWOL it has to exist in the first place and scientific proof for a 'SARS-Cov-2' can be filed under nothing, nowhere and zilch.

Dr Andrew Kaufman is a board-certified forensic psychiatrist in New York State, a Doctor of Medicine and former Assistant Professor and Medical Director of Psychiatry at SUNY Upstate Medical University, and Medical Instructor of Hematology and Oncology at the Medical School of South Carolina. He also studied biology at the Massachusetts Institute of Technology (MIT) and trained in Psychiatry at Duke University. Kaufman is retired from allopathic medicine, but remains a consultant and educator on natural healing, I saw a video of his very early on in the 'Covid' hoax in which he questioned claims about the 'virus' in the absence of any supporting evidence and with plenty pointing the other way. I did everything I could to circulate his work which I felt was asking the pivotal questions that needed an answer. I can recommend an excellent pull-together interview he did with the website The Last Vagabond entitled *Dr Andrew Kaufman: Virus Isolation, Terrain Theory and Covid-19* and his website is andrewkaufmanmd.com. Kaufman is not only a forensic psychiatrist; he is forensic in all that he does. He always reads original scientific papers, experiments and studies instead of second-third-fourth-hand reports about the 'virus' in the media which are repeating the repeated repetition of the narrative. When he did so with the original Chinese 'virus' papers Kaufman

realised that there was no evidence of a 'SARS-Cov-2'. They had never – from the start – shown it to exist and every repeat of this claim worldwide was based on the accepted existence of proof that was nowhere to be found – see Kary Mullis and HIV. Here we go again.

Let's postulate

Kaufman discovered that the Chinese authorities immediately concluded that the cause of an illness that broke out among about 200 initial patients in Wuhan was a 'new virus' when there were no grounds to make that conclusion. The alleged 'virus' was not isolated from other genetic material in their samples and then shown through a system known as Koch's postulates to be the causative agent of the illness. The world was told that the SARS-Cov-2 'virus' caused a disease they called 'Covid-19' which had 'flu-like' symptoms and could lead to respiratory problems and pneumonia. If it wasn't so tragic it would almost be funny. *'Flu-like' symptoms'? Pneumonia? Respiratory disease?* What in *CHINA* and particularly in *Wuhan*, one of the most polluted cities in the world with a resulting epidemic of respiratory disease?? Three hundred thousand people get pneumonia in China every year and there are nearly a billion cases worldwide of 'flu-like symptoms'. These have a whole range of causes – including pollution in Wuhan – but no other possibility was credibly considered in late 2019 when the world was told there was a new and deadly 'virus'. The global prevalence of pneumonia and 'flu-like systems' gave the Cult networks unlimited potential to re-diagnose these other causes as the mythical 'Covid-19' and that is what they did from the very start. Kaufman revealed how Chinese medical and science authorities (all subordinates to the Cult-owned communist government) took genetic material from the lungs of only a few of the first patients. The material contained their own cells, bacteria, fungi and other microorganisms living in their bodies. The only way you could prove the existence of the 'virus' and its responsibility for the alleged 'Covid-19' was to isolate the virus from all the other material – a process also known as 'purification' – and

then follow the postulates sequence developed in the late 19th century by German physician and bacteriologist Robert Koch which became the 'gold standard' for connecting an alleged causation agent to a disease:

1. The microorganism (bacteria, fungus, virus, etc.) must be present in every case of the disease and all patients must have the same symptoms. It must also *not be present in healthy individuals*.

2. The microorganism must be isolated from the host with the disease. If the microorganism is a bacteria or fungus it must be grown in a pure culture. If it is a virus, it must be purified (i.e. containing no other material except the virus particles) from a clinical sample.

3. The specific disease, with all of its characteristics, must be reproduced when the infectious agent (the purified virus or a pure culture of bacteria or fungi) is inoculated into a healthy, susceptible host.

4. The microorganism must be recoverable from the experimentally infected host as in step 2.

Not one of these criteria has been met in the case of 'SARS-Cov-2' and 'Covid-19'. Not ONE. *EVER*. Robert Koch refers to bacteria and not viruses. What are called 'viral particles' are so minute (hence masks are useless by any definition) that they could only be seen after the invention of the electron microscope in the 1930s and can still only be observed through that means. American bacteriologist and virologist Thomas Milton Rivers, the so-called 'Father of Modern Virology' who was very significantly director of the Rockefeller Institute for Medical Research in the 1930s, developed a less stringent version of Koch's postulates to identify 'virus' causation known as 'Rivers criteria'. 'Covid' did not pass that process either. Some even doubt whether any 'virus' can be isolated from other particles containing genetic material in the Koch method. Freedom of Information requests in many countries asking for scientific proof that the 'Covid virus' has been purified and isolated and shown to exist have all come back with a 'we don't have that' and when this happened with a request to the UK Department of Health they added this comment:

However, outside of the scope of the [Freedom of Information Act] and on a discretionary basis, the following information has been advised to us, which may be of interest. Most infectious diseases are caused by viruses, bacteria or fungi. Some bacteria or fungi have the capacity to grow on their own in isolation, for example in colonies on a petri dish. Viruses are different in that they are what we call 'obligate pathogens' – that is, they cannot survive or reproduce without infecting a host ...

… For some diseases, it is possible to establish causation between a microorganism and a disease by isolating the pathogen from a patient, growing it in pure culture and reintroducing it to a healthy organism. These are known as 'Koch's postulates' and were developed in 1882. However, as our understanding of disease and different disease-causing agents has advanced, these are no longer the method for determining causation [Andrew Kaufman asks why in that case are there two published articles falsely claiming to satisfy Koch's postulates].

It has long been known that viral diseases cannot be identified in this way as viruses cannot be grown in 'pure culture'. When a patient is tested for a viral illness, this is normally done by looking for the presence of antigens, or viral genetic code in a host with molecular biology techniques [Kaufman asks how you could know the origin of these chemicals without having a pure culture for comparison].

For the record 'antigens' are defined so:

Invading microorganisms have antigens on their surface that the human body can recognise as being foreign – meaning not belonging to it. When the body recognises a foreign antigen, lymphocytes (white blood cells) produce antibodies, which are complementary in shape to the antigen.

Notwithstanding that this is open to question in relation to 'SARS-Cov-2' the presence of 'antibodies' can have many causes and they are found in people that are perfectly well. Kary Mullis said: 'Antibodies … had always been considered evidence of past disease, not present disease.'

'Covid' really is a *computer* 'virus'

Where the UK Department of Health statement says 'viruses' are now 'diagnosed' through a 'viral genetic code in a host with molecular biology techniques', they mean … *the PCR test* which its inventor said cannot test for infectious disease. They have no credible method of connecting a 'virus' to a disease and we will see that there is no scientific proof that any 'virus' causes any disease or there is any such thing as a 'virus' in the way that it is described. Tenacious Canadian researcher Christine Massey and her team made

some 40 Freedom of Information requests to national public health agencies in different countries asking for proof that SARS-CoV-2 has been isolated and not one of them could supply that information. Massey said of her request in Canada: 'Freedom of Information reveals Public Health Agency of Canada has no record of 'SARS-COV-2' isolation performed by anyone, anywhere, ever.' If you accept the comment from the UK Department of Health it's because they can't isolate a 'virus'. Even so many 'science' papers claimed to have isolated the 'Covid virus' until they were questioned and had to admit they hadn't. A reply from the Robert Koch Institute in Germany was typical: 'I am not aware of a paper which purified isolated SARS-CoV-2.' So what the hell was Christian Drosten and his gang using to design the 'Covid' testing protocol that has produced all the illusory Covid' cases and 'Covid' deaths when the head of the Chinese version of the CDC admitted there was a problem right from the start in that the 'virus' had never been isolated/purified? Breathe deeply: What they are calling 'Covid' is actually created by a *computer program* i.e. *they made it up* – er, that's it. They took lung fluid, with many sources of genetic material, from one single person alleged to be infected with Covid-19 by a PCR test which they *claimed*, without clear evidence, contained a 'virus'. They used several computer programs to create a model of a theoretical virus genome sequence from more than fifty-six million small sequences of RNA, each of an unknown source, assembling them like a puzzle with no known solution. The computer filled in the gaps with sequences from bits in the gene bank to make it look like a bat SARS-like coronavirus! A wave of the magic wand and poof, an in silico (computer-generated) genome, a scientific fantasy, was created. UK health researcher Dr Kevin Corbett made the same point with this analogy:

> … It's like giving you a few bones and saying that's your fish. It could be any fish. Not even a skeleton. Here's a few fragments of bones. That's your fish … It's all from gene bank and the bits of the virus sequence that weren't there they made up.
>
> They synthetically created them to fill in the blanks. That's what genetics is; it's a code. So it's ABBBCCDDD and you're missing some what you think is EEE so you put it in. It's all

synthetic. You just manufacture the bits that are missing. This is the end result of the geneticization of virology. This is basically a computer virus.

Further confirmation came in an email exchange between British citizen journalist Frances Leader and the government's Medicines & Healthcare Products Regulatory Agency (the Gates-funded MHRA) which gave emergency permission for untested 'Covid vaccines' to be used. The agency admitted that the 'vaccine' is not based on an isolated 'virus', but comes from a *computer-generated model*. Frances Leader was naturally banned from Cult-owned fascist Twitter for making this exchange public. The process of creating computer-generated alleged 'viruses' is called 'in silico' or 'in silicon' – computer chips – and the term 'in silico' is believed to originate with biological experiments using only a computer in 1989. 'Vaccines' involved with 'Covid' are also produced 'in silico' or by computer not a natural process. If the original 'virus' is nothing more than a made-up computer model how can there be 'new variants' of something that never existed in the first place? They are not new 'variants'; they are new *computer models* only minutely different to the original program and designed to further terrify the population into having the 'vaccine' and submitting to fascism. You want a 'new variant'? Click, click, enter – there you go. Tell the medical profession that you have discovered a 'South African variant', 'UK variants' or a 'Brazilian variant' and in the usual HIV-causes-AIDS manner they will unquestioningly repeat it with no evidence whatsoever to support these claims. They will go on television and warn about the dangers of 'new variants' while doing nothing more than repeating what they have been told to be true and knowing that any deviation from that would be career suicide. Big-time insiders will know it's a hoax, but much of the medical community is clueless about the way they are being played and themselves play the public without even being aware they are doing so. What an interesting 'coincidence' that AstraZeneca and Oxford University were conducting 'Covid vaccine trials' in the three countries – the UK, South Africa and Brazil – where the first three 'variants' were claimed to have 'broken out'.

Here's your 'virus' – it's a unicorn

Dr Andrew Kaufman presented a brilliant analysis describing how the 'virus' was imagined into fake existence when he dissected an article published by *Nature* and written by 19 authors detailing *alleged* 'sequencing of a complete viral genome' of the 'new SARS-CoV-2 virus'. This computer-modelled *in silico* genome was used as a template for all subsequent genome sequencing experiments that resulted in the so-called variants which he said now number more than *6,000*. The fake genome was constructed from more than 56 million individual short strands of RNA. Those little pieces were assembled into longer pieces by finding areas of overlapping sequences. The computer programs created over two million possible combinations from which the authors simply chose the longest one. They then compared this to a 'bat virus' and the computer 'alignment' rearranged the sequence and filled in the gaps! They called this computer-generated abomination the 'complete genome'. Dr Tom Cowan, a fellow medical author and collaborator with Kaufman, said such computer-generation constitutes scientific fraud and he makes this superb analogy:

> Here is an equivalency: A group of researchers claim to have found a unicorn because they found a piece of a hoof, a hair from a tail, and a snippet of a horn. They then add that information into a computer and program it to re-create the unicorn, and they then claim this computer re-creation is the real unicorn. Of course, they had never actually seen a unicorn so could not possibly have examined its genetic makeup to compare their samples with the actual unicorn's hair, hooves and horn.
>
> The researchers claim they decided which is the real genome of SARS-CoV-2 by 'consensus', sort of like a vote. Again, different computer programs will come up with different versions of the imaginary 'unicorn', so they come together as a group and decide which is the real imaginary unicorn.

This is how the 'virus' that has transformed the world was brought into fraudulent 'existence'. Extraordinary, yes, but as the Nazis said the bigger the lie the more will believe it. Cowan, however, wasn't finished and he went on to identify what he called the real blockbuster in the paper. He quotes this section from a paper written

by virologists and published by the CDC and then explains what it means:

Therefore, we examined the capacity of SARS-CoV-2 to infect and replicate in several common primate and human cell lines, including human adenocarcinoma cells (A549), human liver cells (HUH 7.0), and human embryonic kidney cells (HEK-293T). In addition to Vero E6 and Vero CCL81 cells. ... Each cell line was inoculated at high multiplicity of infection and examined 24h post-infection.

No CPE was observed in any of the cell lines except in Vero cells, which grew to greater than 10 to the 7th power at 24 h post-infection. In contrast, HUH 7.0 and 293T showed only modest viral replication, and A549 cells were incompatible with SARS CoV-2 infection.

Cowan explains that when virologists attempt to prove infection they have three possible 'hosts' or models on which they can test. The first was humans. Exposure to humans was generally not done for ethical reasons and has never been done with SARS-CoV-2 or any coronavirus. The second possible host was animals. Cowan said that forgetting for a moment that they never actually use purified virus when exposing animals they do use solutions that they *claim* contain the virus. Exposure to animals has been done with SARS-CoV-2 in an experiment involving mice and this is what they found: *None of the wild (normal) mice got sick*. In a group of genetically-modified mice, a statistically insignificant number lost weight and had slightly bristled fur, but they experienced nothing like the illness called 'Covid-19'. Cowan said the third method – the one they mostly rely on – is to inoculate solutions they *say* contain the virus onto a variety of tissue cultures. This process had never been shown to kill tissue *unless* the sample material was starved of nutrients and poisoned as *part of the process*. Yes, incredibly, in tissue experiments designed to show the 'virus' is responsible for killing the tissue they starve the tissue of nutrients and add toxic drugs including antibiotics and they do not have control studies to see if it's the starvation and poisoning that is degrading the tissue rather than the 'virus' they allege to be in there somewhere. You want me to pinch you? Yep, I understand. Tom Cowan said this about the whole nonsensical farce as he explains what that quote from the CDC paper really means:

The shocking thing about the above quote is that using their own methods, the virologists found that solutions containing SARS-CoV-2 – even in high amounts – were NOT, I repeat NOT, infective to any of the three human tissue cultures they tested. In plain English, this means they proved, on their terms, that this 'new coronavirus' is not infectious to human beings. It is ONLY infective to monkey kidney cells, and only then when you add two potent drugs (gentamicin and amphotericin), known to be toxic to kidneys, to the mix.

My friends, read this again and again. These virologists, published by the CDC, performed a clear proof, on their terms, showing that the SARS-CoV-2 virus is harmless to human beings. That is the only possible conclusion, but, unfortunately, this result is not even mentioned in their conclusion. They simply say they can provide virus stocks cultured only on monkey Vero cells, thanks for coming.

Cowan concluded: 'If people really understood how this "science" was done, I would hope they would storm the gates and demand honesty, transparency and truth.' Dr Michael Yeadon, former Vice President and Chief Scientific Adviser at drug giant Pfizer has been a vocal critic of the 'Covid vaccine' and its potential for multiple harm. He said in an interview in April, 2021, that 'not one [vaccine] has the virus. He was asked why vaccines normally using a 'dead' version of a disease to activate the immune system were not used for 'Covid' and instead we had the synthetic methods of the 'mRNA Covid vaccine'. Yeadon said that to do the former 'you'd have to have some of [the virus] wouldn't you?' He added: 'No-one's got any – seriously.' Yeadon said that surely they couldn't have fooled the whole world for a year without having a virus, 'but oddly enough ask around – no one's got it'. He didn't know why with all the 'great labs' around the world that the virus had not been isolated – 'Maybe they've been too busy running bad PCR tests and vaccines that people don't need.' What is today called 'science' is not 'science' at all. Science is no longer what is, but whatever people can be manipulated to *believe* that it is. Real science has been hijacked by the Cult to dispense and produce the 'expert scientists' and contentions that suit the agenda of the Cult. How big-time this has happened with the 'Covid' hoax which is entirely based on fake science delivered by fake 'scientists' and fake 'doctors'. The human-caused climate change hoax is also entirely based on fake science delivered by fake 'scientists' and fake 'climate experts'. In both cases real

scientists, climate experts and doctors have their views suppressed and deleted by the Cult-owned science establishment, media and Silicon Valley. This is the 'science' that politicians claim to be 'following' and a common denominator of 'Covid' and climate are Cult psychopaths Bill Gates and his mate Klaus Schwab at the Gates-funded World Economic Forum. But, don't worry, it's all just a coincidence and absolutely nothing to worry about. *Zzzzzzzz*.

What is a 'virus' REALLY?

Dr Tom Cowan is one of many contesting the very existence of viruses let alone that they cause disease. This is understandable when there is no scientific evidence for a disease-causing 'virus'. German virologist Dr Stefan Lanka won a landmark case in 2017 in the German Supreme Court over his contention that there is no such thing as a measles virus. He had offered a big prize for anyone who could prove there is and Lanka won his case when someone sought to claim the money. There is currently a prize of more than 225,000 euros on offer from an Isolate Truth Fund for anyone who can prove the isolation of SARS-CoV-2 and its genetic substance. Lanka wrote in an article headed 'The Misconception Called Virus' that scientists think a 'virus' is causing tissue to become diseased and degraded when in fact it is the *processes they are using* which do that – not a 'virus'. Lanka has done an important job in making this point clear as Cowan did in his analysis of the CDC paper. Lanka says that all claims about viruses as disease-causing pathogens are wrong and based on 'easily recognisable, understandable and verifiable misinterpretations.' Scientists believed they were working with 'viruses' in their laboratories when they were really working with 'typical particles of specific dying tissues or cells …' Lanka said that the tissue decaying process claimed to be caused by a 'virus' still happens when no alleged 'virus' is involved. It's the *process* that does the damage and not a 'virus'. The genetic sample is deprived of nutrients, removed from its energy supply through removal from the body and then doused in toxic antibiotics to remove any bacteria. He confirms again that establishment scientists do not (pinch me)

conduct control experiments to see if this is the case and if they did they would see the claims that 'viruses' are doing the damage is nonsense. He adds that during the measles 'virus' court case he commissioned an independent laboratory to perform just such a control experiment and the result was that the tissues and cells died in the exact same way as with alleged 'infected' material. This is supported by a gathering number of scientists, doctors and researchers who reject what is called 'germ theory' or the belief in the body being infected by contagious sources emitted by other people. Researchers Dawn Lester and David Parker take the same stance in their highly-detailed and sourced book *What Really Makes You Ill – Why everything you thought you knew about disease is wrong* which was recommended to me by a number of medical professionals genuinely seeking the truth. Lester and Parker say there is no provable scientific evidence to show that a 'virus' can be transmitted between people or people and animals or animals and people:

> The definition also claims that viruses are the cause of many diseases, as if this has been definitively proven. But this is not the case; there is no original scientific evidence that definitively demonstrates that any virus is the cause of any disease. The burden of proof for any theory lies with those who proposed it; but none of the existing documents provides 'proof' that supports the claim that 'viruses' are pathogens.

Dr Tom Cowan employs one of his clever analogies to describe the process by which a 'virus' is named as the culprit for a disease when what is called a 'virus' is only material released by cells detoxing themselves from infiltration by chemical or radiation poisoning. The tidal wave of technologically-generated radiation in the 'smart' modern world plus all the toxic food and drink are causing this to happen more than ever. Deluded 'scientists' misread this as a gathering impact of what they wrongly label 'viruses'.

Paper can infect houses

Cowan said in an article for davidicke.com – with his tongue only mildly in his cheek – that he believed he had made a tremendous

discovery that may revolutionise science. He had discovered that small bits of paper are alive, 'well alive-ish', can 'infect' houses, and then reproduce themselves inside the house. The result was that this explosion of growth in the paper inside the house causes the house to explode, blowing it to smithereens. His evidence for this new theory is that in the past months he had carefully examined many of the houses in his neighbourhood and found almost no scraps of paper on the lawns and surrounds of the house. There was an occasional stray label, but nothing more. Then he would return to these same houses a week or so later and with a few, not all of them, particularly the old and decrepit ones, he found to his shock and surprise they were littered with stray bits of paper. He knew then that the paper had infected these houses, made copies of itself, and blew up the house. A young boy on a bicycle at one of the sites told him he had seen a demolition crew using dynamite to explode the house the previous week, but Cowan dismissed this as the idle thoughts of silly boys because 'I was on to something big'. He was on to how 'scientists' mistake genetic material in the detoxifying process for something they call a 'virus'. Cowan said of his house and paper story:

> If this sounds crazy to you, it's because it should. This scenario is obviously nuts. But consider this admittedly embellished, for effect, current viral theory that all scientists, medical doctors and virologists currently believe.

He takes the example of the 'novel SARS-Cov2' virus to prove the point. First they take someone with an undefined illness called 'Covid-19' and don't even attempt to find any virus in their sputum. Never mind the scientists still describe how this 'virus', which they have not located attaches to a cell receptor, injects its genetic material, in 'Covid's' case, RNA, into the cell. The RNA once inserted exploits the cell to reproduce itself and makes 'thousands, nay millions, of copies of itself … Then it emerges victorious to claim its next victim':

If you were to look in the scientific literature for proof, actual scientific proof, that uniform SARS-CoV2 viruses have been properly isolated from the sputum of a sick person, that actual spike proteins could be seen protruding from the virus (which has not been found), you would find that such evidence doesn't exist.

If you go looking in the published scientific literature for actual pictures, proof, that these spike proteins or any viral proteins are ever attached to any receptor embedded in any cell membrane, you would also find that no such evidence exists. If you were to look for a video or documented evidence of the intact virus injecting its genetic material into the body of the cell, reproducing itself and then emerging victorious by budding off the cell membrane, you would find that no such evidence exists.

The closest thing you would find is electron micrograph pictures of cellular particles, possibly attached to cell debris, both of which to be seen were stained by heavy metals, a process that completely distorts their architecture within the living organism. This is like finding bits of paper stuck to the blown-up bricks, thereby proving the paper emerged by taking pieces of the bricks on its way out.

The Enders baloney

Cowan describes the 'Covid' story as being just as make-believe as his paper story and he charts back this fantasy to a Nobel Prize winner called John Enders (1897-1985), an American biomedical scientist who has been dubbed 'The Father of Modern Vaccines'. Enders is claimed to have 'discovered' the process of the viral culture which 'proved' that a 'virus' caused measles. Cowan explains how Enders did this 'by using the EXACT same procedure that has been followed by every virologist to find and characterize every new virus since 1954'. Enders took throat swabs from children with measles and immersed them in 2ml of milk. Penicillin (100u/ml) and the antibiotic streptomycin (50,g/ml) were added and the whole mix was centrifuged – rotated at high speed to separate large cellular debris from small particles and molecules as with milk and cream, for example. Cowan says that if the aim is to find little particles of genetic material ('viruses') in the snot from children with measles it would seem that the last thing you would do is mix the snot with other material – milk –that also has genetic material. 'How are you ever going to know whether whatever you found came from the snot or the milk?' He points out that streptomycin is a 'nephrotoxic' or poisonous-to-the-kidney drug. You will see the relevance of that

shortly. Cowan says that it gets worse, much worse, when Enders describes the culture medium upon which the virus 'grows': 'The culture medium consisted of bovine amniotic fluid (90%), beef embryo extract (5%), horse serum (5%), antibiotics and phenol red as an indicator of cell metabolism.' Cowan asks incredulously: 'Did he just say that the culture medium also contained fluids and tissues that are themselves rich sources of genetic material?' The genetic cocktail, or 'medium', is inoculated onto tissue and cells from rhesus monkey *kidney* tissue. This is where the importance of streptomycin comes in and currently-used antimicrobials and other drugs that are *poisonous to kidneys* and used in ALL modern viral cultures (e.g. gentamicin, streptomycin, and amphotericin). Cowan asks: 'How are you ever going to know from this witch's brew where any genetic material comes from as we now have five different sources of rich genetic material in our mix?' Remember, he says, that all genetic material, whether from monkey kidney tissues, bovine serum, milk, etc., is made from the exact same components. The same central question returns: 'How are you possibly going to know that it was the virus that killed the kidney tissue and not the toxic antibiotic and starvation rations on which you are growing the tissue?' John Enders answered the question himself – *you can't*:

A second agent was obtained from an uninoculated culture of monkey kidney cells. The cytopathic changes [death of the cells] it induced in the unstained preparations could not be distinguished with confidence from the viruses isolated from measles.

The death of the cells ('cytopathic changes') happened in exactly the same manner, whether they inoculated the kidney tissue with the measles snot or not, Cowan says. 'This is evidence that the destruction of the tissue, the very proof of viral causation of illness, was not caused by anything in the snot because they saw the same destructive effect when the snot was not even used … the cytopathic, i.e., cell-killing, changes come from the process of the culture itself, not from any virus in any snot, period.' Enders quotes in his 1957 paper a virologist called Ruckle as reporting similar findings 'and in addition has isolated an agent from monkey kidney tissue that is so

far indistinguishable from human measles virus'. In other words, Cowan says, these particles called 'measles viruses' are simply and clearly breakdown products of the starved and poisoned tissue. For measles 'virus' see all 'viruses' including the so-called 'Covid virus'. Enders, the 'Father of Modern Vaccines', also said:

There is a potential risk in employing cultures of primate cells for the production of vaccines composed of attenuated virus, since the presence of other agents possibly latent in primate tissues cannot be definitely excluded by any known method.

Cowan further quotes from a paper published in the journal *Viruses* in May, 2020, while the 'Covid pandemic' was well underway in the media if not in reality. 'EVs' here refers to particles of genetic debris from our own tissues, such as exosomes of which more in a moment: 'The remarkable resemblance between EVs and viruses has caused quite a few problems in the studies focused on the analysis of EVs released during viral infections.' Later the paper adds that to date a reliable method that can actually guarantee a complete separation (of EVs from viruses) DOES NOT EXIST. This was published at a time when a fairy tale 'virus' was claimed in total certainty to be causing a fairy tale 'viral disease' called 'Covid-19' – a fairy tale that was already well on the way to transforming human society in the image that the Cult has worked to achieve for so long. Cowan concludes his article:

To summarize, there is no scientific evidence that pathogenic viruses exist. What we think of as 'viruses' are simply the normal breakdown products of dead and dying tissues and cells. When we are well, we make fewer of these particles; when we are starved, poisoned, suffocated by wearing masks, or afraid, we make more.

There is no engineered virus circulating and making people sick. People in laboratories all over the world are making genetically modified products to make people sick. These are called vaccines. There is no virome, no 'ecosystem' of viruses, viruses are not 8%, 50% or 100 % of our genetic material. These are all simply erroneous ideas based on the misconception called a virus.

What is 'Covid'? Load of bollocks

The background described here by Cowan and Lanka was emphasised in the first video presentation that I saw by Dr Andrew Kaufman when he asked whether the 'Covid virus' was in truth a natural defence mechanism of the body called 'exosomes'. These are released by cells when in states of toxicity – see the same themes returning over and over. They are released ever more profusely as chemical and radiation toxicity increases and think of the potential effect therefore of 5G alone as its destructive frequencies infest the human energetic information field with a gathering pace (5G went online in Wuhan in 2019 as the 'virus' emerged). I'll have more about this later. Exosomes transmit a warning to the rest of the body that 'Houston, we have a problem'. Kaufman presented images of exosomes and compared them with 'Covid' under an electron microscope and the similarity was remarkable. They both attach to the same cell receptors (*claimed* in the case of 'Covid'), contain the same genetic material in the form of RNA or ribonucleic acid, and both are found in 'viral cell cultures' with damaged or dying cells. James Hildreth MD, President and Chief Executive Officer of the Meharry Medical College at Johns Hopkins, said: 'The virus is fully an exosome in every sense of the word.' Kaufman's conclusion was that there is no 'virus': 'This entire pandemic is a completely manufactured crisis … there is no evidence of anyone dying from [this] illness.' Dr Tom Cowan and Sally Fallon Morell, authors of *The Contagion Myth*, published a statement with Dr Kaufman in February, 2021, explaining why the 'virus' does not exist and you can read it that in full in the Appendix.

'Virus' theory can be traced to the 'cell theory' in 1858 of German physician Rudolf Virchow (1821-1920) who contended that disease originates from a single cell infiltrated by a 'virus'. Dr Stefan Lanka said that findings and insights with respect to the structure, function and central importance of tissues in the creation of life, which were already known in 1858, comprehensively refute the cell theory. Virchow ignored them. We have seen the part later played by John Enders in the 1950s and Lanka notes that infection theories were only established as a global dogma through the policies and

eugenics of the Third Reich in Nazi Germany (creation of the same Sabbatian cult behind the 'Covid' hoax). Lanka said: 'Before 1933, scientists dared to contradict this theory; after 1933, these critical scientists were silenced'. Dr Tom Cowan's view is that ill-heath is caused by too much of something, too little of something, or toxification from chemicals and radiation – not contagion. We must also highlight as a major source of the 'virus' theology a man still called the 'Father of Modern Virology' – Thomas Milton Rivers (1888-1962). There is no way given the Cult's long game policy that it was a coincidence for the 'Father of Modern Virology' to be director of the Rockefeller Institute for Medical Research from 1937 to 1956 when he is credited with making the Rockefeller Institute a leader in 'viral research'. Cult Rockefellers were the force behind the creation of Big Pharma 'medicine', established the World Health Organisation in 1948, and have long and close associations with the Gates family that now runs the WHO during the pandemic hoax through mega-rich Cult gofer and psychopath Bill Gates.

Only a Renegade Mind can see through all this bullshit by asking the questions that need to be answered, not taking 'no' or prevarication for an answer, and certainly not hiding from the truth in fear of speaking it. Renegade Minds have always changed the world for the better and they will change this one no matter how bleak it may currently appear to be.

CHAPTER SIX

Sequence of deceit

If you tell the truth, you don't have to remember anything
Mark Twain

Against the background that I have laid out this far the sequence that took us from an invented 'virus' in Cult-owned China in late 2019 to the fascist transformation of human society can be seen and understood in a whole new context.

We were told that a deadly disease had broken out in Wuhan and the world media began its campaign (coordinated by behavioural psychologists as we shall see) to terrify the population into unquestioning compliance. We were shown images of Chinese people collapsing in the street which never happened in the West with what was supposed to be the same condition. In the earliest days when alleged cases and deaths were few the fear register was hysterical in many areas of the media and this would expand into the common media narrative across the world. The real story was rather different, but we were never told that. The Chinese government, one of the Cult's biggest centres of global operation, said they had discovered a new illness with flu-like and pneumonia-type symptoms in a city with such toxic air that it is overwhelmed with flu-like symptoms, pneumonia and respiratory disease. Chinese scientists said it was a new – 'novel' – coronavirus which they called Sars-Cov-2 and that it caused a disease they labelled 'Covid-19'. There was no evidence for this and the 'virus' has never to this day been isolated, purified and its genetic code established from that. It

was from the beginning a computer-generated fiction. Stories of Chinese whistleblowers saying the number of deaths was being supressed or that the 'new disease' was related to the Wuhan bio-lab misdirected mainstream and alternative media into cul-de-sacs to obscure the real truth – there was no 'virus'.

Chinese scientists took genetic material from the lung fluid of just a few people and said they had found a 'new' disease when this material had a wide range of content. There was no evidence for a 'virus' for the very reasons explained in the last two chapters. The 'virus' has never been shown to (a) exist and (b) cause any disease. People were diagnosed on symptoms that are so widespread in Wuhan and polluted China and with a PCR test that can't detect infectious disease. On this farce the whole global scam was sold to the rest of the world which would also diagnose respiratory disease as 'Covid-19' from symptoms alone or with a PCR test not testing for a 'virus'. Flu miraculously disappeared *worldwide* in 2020 and into 2021 as it was redesignated 'Covid-19'. It was really the same old flu with its 'flu-like' symptoms attributed to 'flu-like' 'Covid-19'. At the same time with very few exceptions the Chinese response of draconian lockdown and fascism was the chosen weapon to respond across the West as recommended by the Cult-owned Tedros at the Cult-owned World Health Organization run by the Cult-owned Gates. All was going according to plan. Chinese scientists – everything in China is controlled by the Cult-owned government – compared their contaminated RNA lung-fluid material with other RNA sequences and said it appeared to be just under 80 percent identical to the SARS-CoV-1 'virus' claimed to be the cause of the SARS (severe acute respiratory syndrome) 'outbreak' in 2003. They decreed that because of this the 'new virus' had to be related and they called it SARS-CoV-2. There are some serious problems with this assumption and *assumption* was all it was. Most 'factual' science turns out to be assumptions repeated into everyone-knows-that. A match of under 80-percent is meaningless. Dr Kaufman makes the point that there's a *96 percent* genetic correlation between humans and chimpanzees, but 'no one would say our genetic material is part

of the chimpanzee family'. Yet the Chinese authorities were claiming that a much lower percentage, less than 80 percent, proved the existence of a new 'coronavirus'. For goodness sake human DNA is 60 percent similar to a *banana*.

You are feeling sleepy

The entire 'Covid' hoax is a global Psyop, a psychological operation to program the human mind into believing and fearing a complete fantasy. A crucial aspect of this was what *appeared* to happen in Italy. It was all very well streaming out daily images of an alleged catastrophe in Wuhan, but to the Western mind it was still on the other side of the world in a very different culture and setting. A reaction of 'this could happen to me and my family' was still nothing like as intense enough for the mind-doctors. The Cult needed a Western example to push people over that edge and it chose Italy, one of its major global locations going back to the Roman Empire. An Italian 'Covid' crisis was manufactured in a particular area called Lombardy which just happens to be notorious for its toxic air and therefore respiratory disease. Wuhan, China, déjà vu. An hysterical media told horror stories of Italians dying from 'Covid' in their droves and how Lombardy hospitals were being overrun by a tidal wave of desperately ill people needing treatment after being struck down by the 'deadly virus'. Here was the psychological turning point the Cult had planned. Wow, if this is happening in Italy, the Western mind concluded, this indeed could happen to me and my family. Another point is that Italian authorities responded by following the Chinese blueprint so vehemently recommended by the Cult-owned World Health Organization. They imposed fascistic lockdowns on the whole country viciously policed with the help of surveillance drones sweeping through the streets seeking out anyone who escaped from mass house arrest. Livelihoods were destroyed and psychology unravelled in the way we have witnessed since in all lockdown countries. Crucial to the plan was that Italy responded in this way to set the precedent of suspending freedom and imposing fascism in a 'Western liberal democracy'. I emphasised in an

animated video explanation on davidicke.com posted in the summer of 2020 how important it was to the Cult to expand the Chinese lockdown model across the West. Without this, and the bare-faced lie that non-symptomatic people could still transmit a 'disease' they didn't have, there was no way locking down the whole population, sick and not sick, could be pulled off. At just the right time and with no evidence Cult operatives and gofers claimed that people without symptoms could pass on the 'disease'. In the name of protecting the 'vulnerable' like elderly people, who lockdowns would kill by the tens of thousands, we had for the first time healthy people told to isolate as well as the sick. The great majority of people who tested positive had no symptoms because there was nothing wrong with them. It was just a trick made possible by a test not testing for the 'virus'.

Months after my animated video the Gates-funded Professor Neil Ferguson at the Gates-funded Imperial College confirmed that I was right. He didn't say it in those terms, naturally, but he did say it. Ferguson will enter the story shortly for his outrageously crazy 'computer models' that led to Britain, the United States and many other countries following the Chinese and now Italian methods of response. Put another way, following the Cult script. Ferguson said that SAGE, the UK government's scientific advisory group which has controlled 'Covid' policy from the start, wanted to follow the Chinese lockdown model (while they all continued to work and be paid), but they wondered if they could possibly, in Ferguson's words, 'get away with it in Europe'. 'Get away with it'? Who the hell do these moronic, arrogant people think they are? This appalling man Ferguson said that once Italy went into national lockdown they realised they, too, could mimic China:

> It's a communist one-party state, we said. We couldn't get away with it in Europe, we thought … and then Italy did it. And we realised we could. Behind this garbage from Ferguson is a simple fact: Doing the same as China in every country was the plan from the start and Ferguson's 'models' would play a central role in achieving that. It's just a coincidence, of course, and absolutely nothing to worry your little head about.

Oops, sorry, our mistake

Once the Italian segment of the Psyop had done the job it was designed to do a very different story emerged. Italian authorities revealed that 99 percent of those who had 'died from Covid-19' in Italy had one, two, three, or more 'co-morbidities' or illnesses and health problems that could have ended their life. The US Centers for Disease Control and Prevention (CDC) published a figure of 94 percent for Americans dying of 'Covid' while having other serious medical conditions – on average two to three (some five or six) other potential causes of death. In terms of death from an unproven 'virus' I say it is 100 percent. The other one percent in Italy and six percent in the US would presumably have died from 'Covid's' flu-like symptoms with a range of other possible causes in conjunction with a test not testing for the 'virus'. Fox News reported that even more startling figures had emerged in one US county in which 410 of 422 deaths attributed to 'Covid-19' had other potentially deadly health conditions. The Italian National Health Institute said later that the average age of people dying with a 'Covid-19' diagnosis in Italy was about 81. Ninety percent were over 70 with ten percent over 90. In terms of other reasons to die some 80 percent had two or more chronic diseases with half having three or more including cardiovascular problems, diabetes, respiratory problems and cancer. Why is the phantom 'Covid-19' said to kill overwhelmingly old people and hardly affect the young? Old people continually die of many causes and especially respiratory disease which you can re-diagnose 'Covid-19' while young people die in tiny numbers by comparison and rarely of respiratory disease. Old people 'die of Covid' because they die of other things that can be redesignated 'Covid' and it really is that simple.

Flu has flown

The blueprint was in place. Get your illusory 'cases' from a test not testing for the 'virus' and redesignate other causes of death as 'Covid-19'. You have an instant 'pandemic' from something that is nothing more than a computer-generated fiction. With near-on a

billion people having 'flu-like' symptoms every year the potential was limitless and we can see why flu quickly and apparently miraculously disappeared *worldwide* by being diagnosed 'Covid-19'. The painfully bloody obvious was explained away by the childlike media in headlines like this in the UK '*Independent*': 'Not a single case of flu detected by Public Health England this year as Covid restrictions suppress virus'. I kid you not. The masking, social distancing and house arrest that did not make the 'Covid virus' disappear somehow did so with the 'flu virus'. Even worse the article, by a bloke called Samuel Lovett, suggested that maybe the masking, sanitising and other 'Covid' measures should continue to keep the flu away. With a ridiculousness that disturbs your breathing (it's 'Covid-19') the said Lovett wrote: 'With widespread social distancing and mask-wearing measures in place throughout the UK, the usual routes of transmission for influenza have been blocked.' He had absolutely no evidence to support that statement, but look at the consequences of him acknowledging the obvious. With flu not disappearing at all and only being relabelled 'Covid-19' he would have to contemplate that 'Covid' was a hoax on a scale that is hard to imagine. You need guts and commitment to truth to even go there and that's clearly something Samuel Lovett does not have in abundance. He would never have got it through the editors anyway.

Tens of thousands die in the United States alone every winter from flu including many with pneumonia complications. CDC figures record *45 million* Americans diagnosed with flu in 2017-2018 of which 61,000 died and some reports claim 80,000. Where was the same hysteria then that we have seen with 'Covid-19'? Some 250,000 Americans are admitted to hospital with pneumonia every year with about 50,000 cases proving fatal. About 65 million suffer respiratory disease every year and three million deaths makes this the third biggest cause of death worldwide. You only have to redesignate a portion of all these people 'Covid-19' and you have an instant global pandemic or the *appearance* of one. Why would doctors do this? They are told to do this and all but a few dare not refuse those who must be obeyed. Doctors in general are not researching their own

knowledge and instead take it direct and unquestioned from the authorities that own them and their careers. The authorities say they must now diagnose these symptoms 'Covid-19' and not flu, or whatever, and they do it. Dark suits say put 'Covid-19' on death certificates no matter what the cause of death and the doctors do it. Renegade Minds don't fall for the illusion that doctors and medical staff are all highly-intelligent, highly-principled, seekers of medical truth. *Some are*, but not the majority. They are repeaters, gofers, and yes sir, no sir, purveyors of what the system demands they purvey. The 'Covid' con is not merely confined to diseases of the lungs. Instructions to doctors to put 'Covid-19' on death certificates for anyone dying of *anything* within 28 days (or much more) of a positive test not testing for the 'virus' opened the floodgates. The term dying *with* 'Covid' and not *of* 'Covid' was coined to cover the truth. Whether it was a *with* or an *of* they were all added to the death numbers attributed to the 'deadly virus' compiled by national governments and globally by the Gates-funded Johns Hopkins operation in the United States that was so involved in those 'pandemic' simulations. Fraudulent deaths were added to the ever-growing list of fraudulent 'cases' from false positives from a false test. No wonder Professor Walter Ricciardi, scientific advisor to the Italian minister of health, said after the Lombardy hysteria had done its job that 'Covid' death rates were due to Italy having the second oldest population in the world and to *how hospitals record deaths*:

The way in which we code deaths in our country is very generous in the sense that all the people who die in hospitals with the coronavirus are deemed to be dying of the coronavirus. On re-evaluation by the National Institute of Health, only 12 per cent of death certificates have shown a direct causality from coronavirus, while 88 per cent of patients who have died have at least one pre-morbidity – many had two or three.

This is extraordinary enough when you consider the propaganda campaign to use Italy to terrify the world, but how can they even say twelve percent were genuine when the 'virus' has not been shown to exist, its 'code' is a computer program, and diagnosis comes from a test not testing for it? As in China, and soon the world, 'Covid-19' in

Italy was a redesignation of diagnosis. Lies and corruption were to become the real 'pandemic' fuelled by a pathetically-compliant medical system taking its orders from the tiny few at the top of their national hierarchy who answered to the World Health Organization which answers to Gates and the Cult. Doctors were told – ordered – to diagnose a particular set of symptoms 'Covid-19' and put that on the death certificate for any cause of death if the patient had tested positive with a test not testing for the virus or had 'Covid' symptoms like the flu. The United States even introduced big financial incentives to manipulate the figures with hospitals receiving £4,600 from the Medicare system for diagnosing someone with regular pneumonia, $13,000 if they made the diagnosis from the same symptoms 'Covid-19' pneumonia, and $39, 000 if they put a 'Covid' diagnosed patient on a ventilator that would almost certainly kill them. A few – painfully and pathetically few – medical whistleblowers revealed (before Cult-owned YouTube deleted their videos) that they had been instructed to 'let the patient crash' and put them straight on a ventilator instead of going through a series of far less intrusive and dangerous methods as they would have done before the pandemic hoax began and the financial incentives kicked in. We are talking cold-blooded murder given that ventilators are so damaging to respiratory systems they are usually the last step before heaven awaits. Renegade Minds never fall for the belief that people in white coats are all angels of mercy and cannot be full-on psychopaths. I have explained in detail in *The Answer* how what I am describing here played out across the world coordinated by the World Health Organization through the medical hierarchies in almost every country.

Medical scientist calls it

Information about the non-existence of the 'virus' began to emerge for me in late March, 2020, and mushroomed after that. I was sent an email by Sir Julian Rose, a writer, researcher, and organic farming promotor, from a medical scientist friend of his in the United States. Even at that early stage in March the scientist was able to explain

how the 'Covid' hoax was being manipulated. He said there were no reliable tests for a specific 'Covid-19 virus' and nor were there any reliable agencies or media outlets for reporting numbers of actual 'Covid-19' cases. We have seen in the long period since then that he was absolutely right. 'Every action and reaction to Covid-19 is based on totally flawed data and we simply cannot make accurate assessments,' he said. Most people diagnosed with 'Covid-19' were showing nothing more than cold and flu-like symptoms 'because most coronavirus strains *are* nothing more than cold/flu-like symptoms'. We had farcical situations like an 84-year-old German man testing positive for 'Covid-19' and his nursing home ordered to quarantine only for him to be found to have a common cold. The scientist described back then why PCR tests and what he called the 'Mickey Mouse test kits' were useless for what they were claimed to be identifying. 'The idea these kits can isolate a specific virus like Covid-19 is nonsense,' he said. Significantly, he pointed out that 'if you want to create a totally false panic about a totally false pandemic – pick a coronavirus'. This is exactly what the Cult-owned Gates, World Economic Forum and Johns Hopkins University did with their Event 201 'simulation' followed by their real-life simulation called the 'pandemic'. The scientist said that all you had to do was select the sickest of people with respiratory-type diseases in a single location – 'say Wuhan' – and administer PCR tests to them. You can then claim that anyone showing 'viral sequences' similar to a coronavirus 'which will inevitably be quite a few' is suffering from a 'new' disease:

> Since you already selected the sickest flu cases a fairly high proportion of your sample will go on to die. You can then say this 'new' virus has a CFR [case fatality rate] higher than the flu and use this to infuse more concern and do more tests which will of course produce more 'cases', which expands the testing, which produces yet more 'cases' and so on and so on. Before long you have your 'pandemic', and all you have done is use a simple test kit trick to convert the worst flu and pneumonia cases into something new that doesn't ACTUALLY EXIST [my emphasis].

He said that you then 'just run the same scam in other countries' and make sure to keep the fear message running high 'so that people

will feel panicky and less able to think critically'. The only problem to overcome was the fact *there is no* actual new deadly pathogen and only regular sick people. This meant that deaths from the 'new deadly pathogen' were going to be way too low for a real new deadly virus pandemic, but he said this could be overcome in the following ways – all of which would go on to happen:

1. You can claim this is just the beginning and more deaths are imminent [you underpin this with fantasy 'computer projections']. Use this as an excuse to quarantine everyone and then claim the quarantine prevented the expected millions of dead.

2. You can [say that people] 'minimizing' the dangers are irresponsible and bully them into not talking about numbers.

3. You can talk crap about made up numbers hoping to blind people with pseudoscience.

4. You can start testing well people (who, of course, will also likely have shreds of coronavirus [RNA] in them) and thus inflate your 'case figures' with 'asymptomatic carriers' (you will of course have to spin that to sound deadly even though any virologist knows the more symptom-less cases you have the less deadly is your pathogen).

The scientist said that if you take these simple steps 'you can have your own entirely manufactured pandemic up and running in weeks'. His analysis made so early in the hoax was brilliantly prophetic of what would actually unfold. Pulling all the information together in these recent chapters we have this is simple 1, 2, 3, of how you can delude virtually the entire human population into believing in a 'virus' that doesn't exist:

- A 'Covid case' is someone who tests positive with a test not testing for the 'virus'.

- A 'Covid death' is someone who dies of *any cause* within 28 days (or much longer) of testing positive with a test not testing for the 'virus.

- Asymptomatic means there is nothing wrong with you, but they claim you can pass on what you don't have to justify locking

down (quarantining) healthy people in totality.

The foundations of the hoax are that simple. A study involving ten million people in Wuhan, published in November, 2020, demolished the whole lie about those without symptoms passing on the 'virus'. They found '300 asymptomatic cases' and traced their contacts to find that not one of them was detected with the 'virus'. 'Asymptomatic' patients and their contacts were isolated for no less than two weeks and nothing changed. I know it's all crap, but if you are going to claim that those without symptoms can transmit 'the virus' then you must produce evidence for that and they never have. Even World Health Organization official Dr Maria Van Kerkhove, head of the emerging diseases and zoonosis unit, said as early as June, 2020, that she doubted the validity of asymptomatic transmission. She said that 'from the data we have, it still seems to be rare that an asymptomatic person actually transmits onward to a secondary individual' and by 'rare' she meant that she couldn't cite any case of asymptomatic transmission.

The Ferguson factor

The problem for the Cult as it headed into March, 2020, when the script had lockdown due to start, was that despite all the manipulation of the case and death figures they still did not have enough people alleged to have died from 'Covid' to justify mass house arrest. This was overcome in the way the scientist described: 'You can claim this is just the beginning and more deaths are imminent … Use this as an excuse to quarantine everyone and then claim the quarantine prevented the expected millions of dead.' Enter one Professor Neil Ferguson, the Gates-funded 'epidemiologist' at the Gates-funded Imperial College in London. Ferguson is Britain's Christian Drosten in that he has a dire record of predicting health outcomes, but is still called upon to advise government on the next health outcome when another 'crisis' comes along. This may seem to be a strange and ridiculous thing to do. Why would you keep turning for policy guidance to people who have a history of being

monumentally wrong? Ah, but it makes sense from the Cult point of view. These 'experts' keep on producing predictions that suit the Cult agenda for societal transformation and so it was with Neil Ferguson as he revealed his horrific (and clearly insane) computer model predictions that allowed lockdowns to be imposed in Britain, the United States and many other countries. Ferguson does not have even an A-level in biology and would appear to have no formal training in computer modelling, medicine or epidemiology, according to Derek Winton, an MSc in Computational Intelligence. He wrote an article somewhat aghast at what Ferguson did which included taking no account of respiratory disease 'seasonality' which means it is far worse in the winter months. Who would have thought that respiratory disease could be worse in the winter? Well, certainly not Ferguson.

The massively China-connected Imperial College and its bizarre professor provided the excuse for the long-incubated Chinese model of human control to travel westward at lightning speed. Imperial College confirms on its website that it collaborates with the Chinese Research Institute; publishes more than 600 research papers every year with Chinese research institutions; has 225 Chinese staff; 2,600 Chinese students – the biggest international group; 7,000 former students living in China which is the largest group outside the UK; and was selected for a tour by China's President Xi Jinping during his state visit to the UK in 2015. The college takes major donations from China and describes itself as the UK's number one university collaborator with Chinese research institutions. The China communist/fascist government did not appear phased by the woeful predictions of Ferguson and Imperial when during the lockdown that Ferguson induced the college signed a five-year collaboration deal with China tech giant Huawei that will have Huawei's indoor 5G network equipment installed at the college's West London tech campus along with an 'AI cloud platform'. The deal includes Chinese sponsorship of Imperial's Venture Catalyst entrepreneurship competition. Imperial is an example of the enormous influence the Chinese government has within British and North American

universities and research centres – and further afield. Up to 200 academics from more than a dozen UK universities are being investigated on suspicion of 'unintentionally' helping the Chinese government build weapons of mass destruction by 'transferring world-leading research in advanced military technology such as aircraft, missile designs and cyberweapons'. Similar scandals have broken in the United States, but it's all a coincidence. Imperial College serves the agenda in many other ways including the promotion of every aspect of the United Nations Agenda 21/2030 (the Great Reset) and produced computer models to show that human-caused 'climate change' is happening when in the real world it isn't. Imperial College is driving the climate agenda as it drives the 'Covid' agenda (both Cult hoaxes) while Patrick Vallance, the UK government's Chief Scientific Adviser on 'Covid', was named Chief Scientific Adviser to the UN 'climate change' conference known as COP26 hosted by the government in Glasgow, Scotland. 'Covid' and 'climate' are fundamentally connected.

Professor Woeful

From Imperial's bosom came Neil Ferguson still advising government despite his previous disasters and it was announced early on that he and other key people like UK Chief Medical Adviser Chris Whitty had caught the 'virus' as the propaganda story was being sold. Somehow they managed to survive and we had Prime Minister Boris Johnson admitted to hospital with what was said to be a severe version of the 'virus' in this same period. His whole policy and demeanour changed when he returned to Downing Street. It's a small world with these government advisors – especially in their communal connections to Gates – and Ferguson had partnered with Whitty to write a paper called 'Infectious disease: Tough choices to reduce Ebola transmission' which involved another scare-story that didn't happen. Ferguson's 'models' predicted that up to150, 000 could die from 'mad cow disease', or BSE, and its version in sheep if it was transmitted to humans. BSE was not transmitted and instead triggered by an organophosphate pesticide used to treat a pest on

cows. Fewer than 200 deaths followed from the human form. Models by Ferguson and his fellow incompetents led to the unnecessary culling of millions of pigs, cattle and sheep in the foot and mouth outbreak in 2001 which destroyed the lives and livelihoods of farmers and their families who had often spent decades building their herds and flocks. Vast numbers of these animals did not have foot and mouth and had no contact with the infection. Another 'expert' behind the cull was Professor Roy Anderson, a computer modeller at Imperial College specialising in the epidemiology of *human*, not animal, disease. Anderson has served on the Bill and Melinda Gates Grand Challenges in Global Health advisory board and chairs another Gates-funded organisation. Gates is everywhere.

In a precursor to the 'Covid' script Ferguson backed closing schools 'for prolonged periods' over the swine flu 'pandemic' in 2009 and said it would affect a third of the world population if it continued to spread at the speed he claimed to be happening. His mates at Imperial College said much the same and a news report said: 'One of the authors, the epidemiologist and disease modeller Neil Ferguson, who sits on the World Health Organisation's emergency committee for the outbreak, said the virus had "full pandemic potential".' Professor Liam Donaldson, the Chris Whitty of his day as Chief Medical Officer, said the worst case could see 30 percent of the British people infected by swine flu with 65,000 dying. Ferguson and Donaldson were indeed proved correct when at the end of the year the number of deaths attributed to swine flu was 392. The term 'expert' is rather liberally applied unfortunately, not least to complete idiots. Swine flu 'projections' were great for GlaxoSmithKline (GSK) as millions rolled in for its Pandemrix influenza vaccine which led to brain damage with children most affected. The British government (taxpayers) paid out more than £60 million in compensation after GSK was given immunity from prosecution. Yet another 'Covid' déjà vu. Swine flu was supposed to have broken out in Mexico, but Dr Wolfgang Wodarg, a German doctor, former member of parliament and critic of the 'Covid' hoax, observed 'the spread of swine flu' in Mexico City at the time. He

said: 'What we experienced in Mexico City was a very mild flu which did not kill more than usual – which killed even fewer people than usual.' Hyping the fear against all the facts is not unique to 'Covid' and has happened many times before. Ferguson is reported to have over-estimated the projected death toll of bird flu (H5N1) by some three million-fold, but bird flu vaccine makers again made a killing from the scare. This is some of the background to the Neil Ferguson who produced the perfectly-timed computer models in early 2020 predicting that half a million people would die in Britain without draconian lockdown and 2.2 million in the United States. Politicians panicked, people panicked, and lockdowns of alleged short duration were instigated to 'flatten the curve' of cases gleaned from a test not testing for the 'virus'. I said at the time that the public could forget the 'short duration' bit. This was an agenda to destroy the livelihoods of the population and force them into mass control through dependency and there was going to be nothing 'short' about it. American researcher Daniel Horowitz described the consequences of the 'models' spewed out by Gates-funded Ferguson and Imperial College:

> What led our government and the governments of many other countries into panic was a single Imperial College of UK study, funded by global warming activists, that predicted 2.2 million deaths if we didn't lock down the country. In addition, the reported 8-9% death rate in Italy scared us into thinking there was some other mutation of this virus that they got, which might have come here.
>
> Together with the fact that we were finally testing and had the ability to actually report new cases, we thought we were headed for a death spiral. But again … we can't flatten a curve if we don't know when the curve started.

How about it *never* started?

Giving them what they want

An investigation by German news outlet *Welt Am Sonntag (World on Sunday)* revealed how in March, 2020, the German government gathered together 'leading scientists from several research institutes and universities' and 'together, they were to produce a [modelling]

paper that would serve as legitimization for further tough political measures'. The Cult agenda was justified by computer modelling not based on evidence or reality; it was specifically constructed to justify the Cult demand for lockdowns all over the world to destroy the independent livelihoods of the global population. All these modellers and everyone responsible for the 'Covid' hoax have a date with a trial like those in Nuremberg after World War Two when Nazis faced the consequences of their war crimes. These corrupt-beyond-belief 'modellers' wrote the paper according to government instructions and it said that that if lockdown measures were lifted then up to one million Germans would die from 'Covid-19' adding that some would die 'agonizingly at home, gasping for breath' unable to be treated by hospitals that couldn't cope. All lies. No matter – it gave the Cult all that it wanted. What did long-time government 'modeller' Neil Ferguson say? If the UK and the United States didn't lockdown half a million would die in Britain and 2.2 million Americans. Anyone see a theme here? 'Modellers' are such a crucial part of the lockdown strategy that we should look into their background and follow the money. Researcher Rosemary Frei produced an excellent article headlined 'The Modelling-paper Mafiosi'. She highlights a guy called John Edmunds, a British epidemiologist, and professor in the Faculty of Epidemiology and Population Health at the London School of Hygiene & Tropical Medicine. He studied at Imperial College. Edmunds is a member of government 'Covid' advisory bodies which have been dictating policy, the New and Emerging Respiratory Virus Threats Advisory Group (NERVTAG) and the Scientific Advisory Group for Emergencies (SAGE).

Ferguson, another member of NERVTAG and SAGE, led the way with the original 'virus' and Edmunds has followed in the 'variant' stage and especially the so-called UK or Kent variant known as the 'Variant of Concern' (VOC) B.1.1.7. He said in a co-written report for the Centre for Mathematical modelling of Infectious Diseases at the London School of Hygiene and Tropical Medicine, with input from the Centre's 'Covid-19' Working Group, that there was 'a realistic

possibility that VOC B.1.1.7 is associated with an increased risk of death compared to non-VOC viruses'. Fear, fear, fear, get the vaccine, fear, fear, fear, get the vaccine. Rosemary Frei reveals that almost all the paper's authors and members of the modelling centre's 'Covid-19' Working Group receive funding from the Bill and Melinda Gates Foundation and/or the associated Gates-funded Wellcome Trust. The paper was published by e-journal *Medr χiv* which only publishes papers not peer-reviewed and the journal was established by an organisation headed by Facebook's Mark Zuckerberg and his missus. What a small world it is. Frei discovered that Edmunds is on the Scientific Advisory Board of the Coalition for Epidemic Preparedness Innovations (CEPI) which was established by the Bill and Melinda Gates Foundation, Klaus Schwab's Davos World Economic Forum and Big Pharma giant Wellcome. CEPI was 'launched in Davos [in 2017] to develop vaccines to stop future epidemics', according to its website. 'Our mission is to accelerate the development of vaccines against emerging infectious diseases and enable equitable access to these vaccines for people during outbreaks.' What kind people they are. Rosemary Frei reveals that Public Health England (PHE) director Susan Hopkins is an author of her organisation's non-peer-reviewed reports on 'new variants'. Hopkins is a professor of infectious diseases at London's Imperial College which is gifted tens of millions of dollars a year by the Bill and Melinda Gates Foundation. Gates-funded modelling disaster Neil Ferguson also co-authors Public Health England reports and he spoke in December, 2020, about the potential danger of the B.1.1.7. 'UK variant' promoted by Gates-funded modeller John Edmunds. When I come to the 'Covid vaccines' the 'new variants' will be shown for what they are – bollocks.

Connections, connections

All these people and modellers are lockdown-obsessed or, put another way, they demand what the Cult demands. Edmunds said in January, 2021, that to ease lockdowns too soon would be a disaster and they had to 'vaccinate much, much, much more widely than the

elderly'. Rosemary Frei highlights that Edmunds is married to Jeanne Pimenta who is described in a LinkedIn profile as director of epidemiology at GlaxoSmithKline (GSK) and she held shares in the company. Patrick Vallance, co-chair of SAGE and the government's Chief Scientific Adviser, is a former executive of GSK and has a deferred bonus of shares in the company worth £600,000. GSK has serious business connections with Bill Gates and is collaborating with mRNA-'vaccine' company CureVac to make 'vaccines' for the new variants that Edmunds is talking about. GSK is planning a 'Covid vaccine' with drug giant Sanofi. Puppet Prime Minister Boris Johnson announced in the spring of 2021 that up to 60 million vaccine doses were to be made at the GSK facility at Barnard Castle in the English North East. Barnard Castle, with a population of just 6,000, was famously visited in breach of lockdown rules in April, 2020, by Johnson aide Dominic Cummings who said that he drove there 'to test his eyesight' before driving back to London. Cummings would be better advised to test his integrity – not that it would take long. The GSK facility had nothing to do with his visit then although I'm sure Patrick Vallance would have been happy to arrange an introduction and some tea and biscuits. Ruthless psychopath Gates has made yet another fortune from vaccines in collaboration with Big Pharma companies and gushes at the phenomenal profits to be made from vaccines – more than a 20-to-1 return as he told one interviewer. Gates also tweeted in December, 2019, with the foreknowledge of what was coming: 'What's next for our foundation? I'm particularly excited about what the next year could mean for one of the best buys in global health: vaccines.'

Modeller John Edmunds is a big promotor of vaccines as all these people appear to be. He's the dean of the London School of Hygiene & Tropical Medicine's Faculty of Epidemiology and Population Health which is primarily funded by the Bill and Melinda Gates Foundation and the Gates-established and funded GAVI vaccine alliance which is the Gates vehicle to vaccinate the world. The organisation Doctors Without Borders has described GAVI as being 'aimed more at supporting drug-industry desires to promote new

products than at finding the most efficient and sustainable means for fighting the diseases of poverty'. But then that's why the psychopath Gates created it. John Edmunds said in a video that the London School of Hygiene & Tropical Medicine is involved in every aspect of vaccine development including large-scale clinical trials. He contends that mathematical modelling can show that vaccines protect individuals and society. That's on the basis of shit in and shit out, I take it. Edmunds serves on the UK Vaccine Network as does Ferguson and the government's foremost 'Covid' adviser, the grim-faced, dark-eyed Chris Whitty. The Vaccine Network says it works 'to support the government to identify and shortlist targeted investment opportunities for the most promising vaccines and vaccine technologies that will help combat infectious diseases with epidemic potential, and to address structural issues related to the UK's broader vaccine infrastructure'. Ferguson is acting Director of the Imperial College Vaccine Impact Modelling Consortium which has funding from the Bill and Melina Gates Foundation and the Gates-created GAVI 'vaccine alliance'. Anyone wonder why these characters see vaccines as the answer to every problem? Ferguson is wildly enthusiastic in his support for GAVI's campaign to vaccine children en masse in poor countries. You would expect someone like Gates who has constantly talked about the need to reduce the population to want to fund vaccines to keep more people alive. I'm sure that's why he does it. The John Edmunds London School of Hygiene & Tropical Medicine (LSHTM) has a Vaccines Manufacturing Innovation Centre which develops, tests and commercialises vaccines. Rosemary Frei writes:

> The vaccines centre also performs affiliated activities like combating 'vaccine hesitancy'. The latter includes the Vaccine Confidence Project. The project's stated purpose is, among other things, 'to provide analysis and guidance for early response and engagement with the public to ensure sustained confidence in vaccines and immunisation'. The Vaccine Confidence Project's director is LSHTM professor Heidi Larson. For more than a decade she's been researching how to combat vaccine hesitancy.

How the bloody hell can blokes like John Edmunds and Neil Ferguson with those connections and financial ties model 'virus' case

and death projections for the government and especially in a way that gives their paymasters like Gates exactly what they want? It's insane, but this is what you find throughout the world.

'Covid' is not dangerous, oops, wait, yes it is

Only days before Ferguson's nightmare scenario made Jackboot Johnson take Britain into a China-style lockdown to save us from a deadly 'virus' the UK government website gov.uk was reporting something very different to Ferguson on a page of official government guidance for 'high consequence infectious diseases (HCID)'. It said this about 'Covid-19':

As of 19 March 2020, COVID-19 *is no longer considered to be a high consequence infectious diseases (HCID) in the UK* [my emphasis]. The 4 nations public health HCID group made an interim recommendation in January 2020 to classify COVID-19 as an HCID. This was based on consideration of the UK HCID criteria about the virus and the disease with information available during the early stages of the outbreak.

Now that more is known about COVID-19, the public health bodies in the UK have reviewed the most up to date information about COVID-19 against the UK HCID criteria. They have determined that several features have now changed; in particular, more information is available about mortality rates (low overall), and there is now greater clinical awareness and a specific and sensitive laboratory test, the availability of which continues to increase. The Advisory Committee on Dangerous Pathogens (ACDP) is also of the opinion that COVID-19 should no longer be classified as an HCID.

Soon after the government had been exposed for downgrading the risk they upgraded it again and everyone was back to singing from the same Cult hymn book. Ferguson and his fellow Gates clones indicated that lockdowns and restrictions would have to continue until a Gates-funded vaccine was developed. Gates said the same because Ferguson and his like were repeating the Gates script which is the Cult script. 'Flatten the curve' became an ongoing nightmare of continuing lockdowns with periods in between of severe restrictions in pursuit of destroying independent incomes and had nothing to do with protecting health about which the Cult gives not a shit. Why wouldn't Ferguson be pushing a vaccine 'solution' when he's owned by vaccine-obsessive Gates who makes a fortune from them and

when Ferguson heads the Vaccine Impact Modelling Consortium at Imperial College funded by the Gates Foundation and GAVI, the 'vaccine alliance', created by Gates as his personal vaccine promotion operation? To compound the human catastrophe that Ferguson's 'models' did so much to create he was later exposed for breaking his own lockdown rules by having sexual liaisons with his married girlfriend Antonia Staats at his home while she was living at another location with her husband and children. Staats was a 'climate' activist and senior campaigner at the Soros-funded Avaaz which I wouldn't trust to tell me that grass is green. Ferguson had to resign as a government advisor over this hypocrisy in May, 2020, but after a period of quiet he was back being quoted by the ridiculous media on the need for more lockdowns and a vaccine rollout. Other government-advising 'scientists' from Imperial College' held the fort in his absence and said lockdown could be indefinite until a vaccine was found. The Cult script was being sung by the payrolled choir. I said there was no intention of going back to 'normal' when the 'vaccine' came because the 'vaccine' is part of a very different agenda that I will discuss in Human 2.0. Why would the Cult want to let the world go back to normal when destroying that normal forever was the whole point of what was happening? House arrest, closing businesses and schools through lockdown, (un)social distancing and masks all followed the Ferguson fantasy models. Again as I predicted (these people are so predictable) when the 'vaccine' arrived we were told that house arrest, lockdown, (un)social distancing and masks would still have to continue. I will deal with the masks in the next chapter because they are of fundamental importance.

Where's the 'pandemic'?

Any mildly in-depth assessment of the figures revealed what was really going on. Cult-funded and controlled organisations still have genuine people working within them such is the number involved. So it is with Genevieve Briand, assistant program director of the Applied Economics master's degree program at Johns Hopkins

University. She analysed the impact that 'Covid-19' had on deaths from *all* causes in the United States using official data from the CDC for the period from early February to early September, 2020. She found that allegedly 'Covid' *related*-deaths exceeded those from heart disease which she found strange with heart disease always the biggest cause of fatalities. Her research became even more significant when she noted the sudden decline in 2020 of *all* non-'Covid' deaths: 'This trend is completely contrary to the pattern observed in all previous years … the total decrease in deaths by other causes almost exactly equals the increase in deaths by Covid-19.' This was such a game, set and match in terms of what was happening that Johns Hopkins University deleted the article on the grounds that it 'was being used to support false and dangerous inaccuracies about the impact of the pandemic'. No – because it exposed the scam from official CDC figures and this was confirmed when those figures were published in January, 2021. Here we can see the effect of people dying from heart attacks, cancer, road accidents and gunshot wounds – *anything* – having 'Covid-19' on the death certificate along with those diagnosed from 'symptoms' who had even not tested positive with a test not testing for the 'virus'. I am not kidding with the gunshot wounds, by the way. Brenda Bock, coroner in Grand County, Colorado, revealed that two gunshot victims tested positive for the 'virus' within the previous 30 days and were therefore classified as 'Covid deaths'. Bock said: 'These two people had tested positive for Covid, but that's not what killed them. A gunshot wound is what killed them.' She said she had not even finished her investigation when the state listed the gunshot victims as deaths due to the 'virus'. The death and case figures for 'Covid-19' are an absolute joke and yet they are repeated like parrots by the media, politicians and alleged medical 'experts'. The official Cult narrative is the only show in town.

Genevieve Briand found that deaths from all causes were not exceptional in 2020 compared with previous years and a Spanish magazine published figures that said the same about Spain which was a 'Covid' propaganda hotspot at one point. *Discovery Salud*, a

health and medicine magazine, quoted government figures which showed how 17,000 *fewer* people died in Spain in 2020 than in 2019 and more than 26,000 fewer than in 2018. The age-standardised mortality rate for England and Wales when age distribution is taken into account was significantly lower in 2020 than the 1970s, 80s and 90s, and was only the ninth highest since 2000. Where is the 'pandemic'?

Post mortems and autopsies virtually disappeared for 'Covid' deaths amid claims that 'virus-infected' bodily fluids posed a risk to those carrying out the autopsy. This was rejected by renowned German pathologist and forensic doctor Klaus Püschel who said that he and his staff had by then done 150 autopsies on 'Covid' patients with no problems at all. He said they were needed to know why some 'Covid' patients suffered blood clots and not severe respiratory infections. The 'virus' is, after all, called SARS or 'severe acute respiratory syndrome'. I highlighted in the spring of 2020 this phenomenon and quoted New York intensive care doctor Cameron Kyle-Sidell who posted a soon deleted YouTube video to say that they had been told to prepare to treat an infectious disease called 'Covid-19', but that was not what they were dealing with. Instead he likened the lung condition of the most severely ill patients to what you would expect with cabin depressurisation in a plane at 30,000 feet or someone dropped on the top of Everest without oxygen or acclimatisation. I have never said this is not happening to a small minority of alleged 'Covid' patients – I am saying this is not caused by a phantom 'contagious virus'. Indeed Kyle-Sidell said that 'Covid-19' was not the disease they were told was coming their way. 'We are operating under a medical paradigm that is untrue,' he said, and he believed they were treating the wrong disease: 'These people are being slowly starved of oxygen.' Patients would take off their oxygen masks in a state of fear and stress and while they were blue in the face on the brink of death. They did not look like patients dying of pneumonia. You can see why they don't want autopsies when their virus doesn't exist and there is another condition in some people that they don't wish to be uncovered. I should add here that

the 5G system of millimetre waves was being rapidly introduced around the world in 2020 and even more so now as they fire 5G at the Earth from satellites. At 60 gigahertz within the 5G range that frequency interacts with the oxygen molecule and stops people breathing in sufficient oxygen to be absorbed into the bloodstream. They are installing 5G in schools and hospitals. The world is not mad or anything. 5G can cause major changes to the lungs and blood as I detail in *The Answer* and these consequences are labelled 'Covid-19', the alleged symptoms of which can be caused by 5G and other electromagnetic frequencies as cells respond to radiation poisoning.

The 'Covid death' scam

Dr Scott Jensen, a Minnesota state senator and medical doctor, exposed 'Covid' Medicare payment incentives to hospitals and death certificate manipulation. He said he was sent a seven-page document by the US Department of Health 'coaching' him on how to fill out death certificates which had never happened before. The document said that he didn't need to have a laboratory test for 'Covid-19' to put that on the death certificate and that shocked him when death certificates are supposed to be about facts. Jensen described how doctors had been 'encouraged, if not pressured' to make a diagnosis of 'Covid-19' if they thought it was probable or *'presumed*'. No positive test was necessary – not that this would have mattered anyway. He said doctors were told to diagnose 'Covid' by symptoms when these were the same as colds, allergies, other respiratory problems, and certainly with influenza which 'disappeared' in the 'Covid' era. A common sniffle was enough to get the dreaded verdict. Ontario authorities decreed that a single care home resident with *one* symptom from a long list must lead to the isolation of the entire home. Other courageous doctors like Jensen made the same point about death figure manipulation and how deaths by other causes were falling while 'Covid-19 deaths' were rising at the same rate due to re-diagnosis. Their videos rarely survive long on YouTube with its Cult-supporting algorithms courtesy of CEO Susan Wojcicki and her bosses at Google. Figure-tampering was so glaring

and ubiquitous that even officials were letting it slip or outright saying it. UK chief scientific adviser Patrick Vallance said on one occasion that 'Covid' on the death certificate doesn't mean 'Covid' was the cause of death (so why the hell is it there?) and we had the rare sight of a BBC reporter telling the truth when she said: 'Someone could be successfully treated for Covid, in say April, discharged, and then in June, get run over by a bus and die … That person would still be counted as a Covid death in England.' Yet the BBC and the rest of the world media went on repeating the case and death figures as if they were real. Illinois Public Health Director Dr Ngozi Ezike revealed the deceit while her bosses must have been clenching their buttocks:

> If you were in a hospice and given a few weeks to live and you were then found to have Covid that would be counted as a Covid death. [There might be] a clear alternate cause, but it is still listed as a Covid death. So everyone listed as a Covid death doesn't mean that was the cause of the death, but that they had Covid at the time of death.

Yes, a 'Covid virus' never shown to exist and tested for with a test not testing for the 'virus'. In the first period of the pandemic hoax through the spring of 2020 the process began of designating almost everything a 'Covid' death and this has continued ever since. I sat in a restaurant one night listening to a loud conversation on the next table where a family was discussing in bewilderment how a relative who had no symptoms of 'Covid', and had died of a long-term problem, could have been diagnosed a death by the 'virus'. I could understand their bewilderment. If they read this book they will know why this medical fraud has been perpetrated the world over.

Some media truth shock

The media ignored the evidence of death certificate fraud until eventually one columnist did speak out when she saw it first-hand. Bel Mooney is a long-time national newspaper journalist in Britain currently working for the *Daily Mail*. Her article on February 19th, 2021, carried this headline: 'My dad Ted passed three Covid tests

and died of a chronic illness yet he's officially one of Britain's 120,000 victims of the virus and is far from alone ... so how many more are there?' She told how her 99-year-old father was in a care home with a long-standing chronic obstructive pulmonary disease and vascular dementia. Maybe, but he was still aware enough to tell her from the start that there was no 'virus' and he refused the 'vaccine' for that reason. His death was not unexpected given his chronic health problems and Mooney said she was shocked to find that 'Covid-19' was declared the cause of death on his death certificate. She said this was a 'bizarre and unacceptable untruth' for a man with long-time health problems who had tested negative twice at the home for the 'virus'. I was also shocked by this story although not by what she said. I had been highlighting the death certificate manipulation for ten months. It was the confirmation that a professional full-time journalist only realised this was going on when it affected her directly and neither did she know that whether her dad tested positive or negative was irrelevant with the test not testing for the 'virus'. Where had she been? She said she did not believe in 'conspiracy theories' without knowing I'm sure that this and 'conspiracy theorists' were terms put into widespread circulation by the CIA in the 1960s to discredit those who did not accept the ridiculous official story of the Kennedy assassination. A blanket statement of 'I don't believe in conspiracy theories' is always bizarre. The dictionary definition of the term alone means the world is drowning in conspiracies. What she said was even more daft when her dad had just been affected by the 'Covid' conspiracy. Why else does she think that 'Covid-19' was going on the death certificates of people who died of something else?

To be fair once she saw from personal experience what was happening she didn't mince words. Mooney was called by the care home on the morning of February 9th to be told her father had died in his sleep. When she asked for the official cause of death what came back was 'Covid-19'. Mooney challenged this and was told there had been deaths from Covid on the dementia floor (confirmed by a test not testing for the 'virus') so they considered it 'reasonable

to assume'. 'But doctor,' Mooney rightly protested, 'an assumption isn't a diagnosis.' She said she didn't blame the perfectly decent and sympathetic doctor – 'he was just doing his job'. Sorry, but that's *bullshit*. He wasn't doing his job at all. He was putting a false cause of death on the death certificate and that is a criminal offence for which he should be brought to account and the same with the millions of doctors worldwide who have done the same. They were not doing their job they were following orders and that must not wash at new Nuremberg trials any more than it did at the first ones. Mooney's doctor was 'assuming' (presuming) as he was told to, but 'just following orders' makes no difference to his actions. A doctor's job is to serve the patient and the truth, not follow orders, but that's what they have done all over the world and played a central part in making the 'Covid' hoax possible with all its catastrophic consequences for humanity. Shame on them and they must answer for their actions. Mooney said her disquiet worsened when she registered her father's death by telephone and was told by the registrar there had been very many other cases like hers where 'the deceased' had not tested positive for 'Covid' yet it was recorded as the cause of death. The test may not matter, but those involved at their level *think* it matters and it shows a callous disregard for accurate diagnosis. The pressure to do this is coming from the top of the national 'health' pyramids which in turn obey the World Health Organization which obeys Gates and the Cult. Mooney said the registrar agreed that this must distort the national figures adding that 'the strangest thing is that every winter we record countless deaths from flu, and this winter there have been none. Not one!' She asked if the registrar thought deaths from flu were being misdiagnosed and lumped together with 'Covid' deaths. The answer was a 'puzzled yes'. Mooney said that the funeral director said the same about 'Covid' deaths which had nothing to do with 'Covid'. They had lost count of the number of families upset by this and other funeral companies in different countries have had the same experience. Mooney wrote:

The nightly shroud-waving and shocking close-ups of pain imposed on us by the TV news bewildered and terrified the population into eager compliance with lockdowns. We were invited to 'save the NHS' and to grieve for strangers – the real-life loved ones behind those shocking death counts. Why would the public imagine what I now fear, namely that the way Covid-19 death statistics are compiled might make the numbers seem greater than they are?

Oh, just a little bit – like 100 percent.

Do the maths

Mooney asked why a country would wish to skew its mortality figures by wrongly certifying deaths? What had been going on? Well, if you don't believe in conspiracies you will never find the answer which is that *it's a conspiracy*. She did, however, describe what she had discovered as a 'national scandal'. In reality it's a global scandal and happening everywhere. Pillars of this conspiracy were all put into place before the button was pressed with the Drosten PCR protocol and high amplifications to produce the cases and death certificate changes to secure illusory 'Covid' deaths. Mooney notes that normally two doctors were needed to certify a death, with one having to know the patient, and how the rules were changed in the spring of 2020 to allow one doctor to do this. In the same period 'Covid deaths' were decreed to be all cases where Covid-19 was put on the death certificate even without a positive test or any symptoms. Mooney asked: 'How many of the 30,851 (as of January 15) care home resident deaths with Covid-19 on the certificate (32.4 per cent of all deaths so far) were based on an assumption, like that of my father? And what has that done to our national psyche?'All of them is the answer to the first question and it has devastated and dismantled the national psyche, actually the global psyche, on a colossal scale. In the UK case and death data is compiled by organisations like Public Health England (PHE) and the Office for National Statistics (ONS). Mooney highlights the insane policy of counting a death from any cause as 'Covid-19' if this happens within 28 days of a positive test (with a test not testing for the 'virus') and she points out that ONS statistics reflect deaths 'involving Covid' 'or due to Covid' which meant in practice any

death where 'Covid-19' was mentioned on the death certificate. She described the consequences of this fraud:

Most people will accept the narrative they are fed, so panicky governments here and in Europe witnessed the harsh measures enacted in totalitarian China and jumped into lockdown. Headlines about Covid deaths tolled like the knell that would bring doomsday to us all. Fear stalked our empty streets. Politicians parroted the frankly ridiculous aim of 'zero Covid' and shut down the economy, while most British people agreed that lockdown was essential and (astonishingly to me, as a patriotic Brit) even wanted more restrictions.

For what? Lies on death certificates? Never mind the grim toll of lives ruined, suicides, schools closed, rising inequality, depression, cancelled hospital treatments, cancer patients in a torture of waiting, poverty, economic devastation, loneliness, families kept apart, and so on. How many lives have been lost as a direct result of lockdown?

She said that we could join in a national chorus of shock and horror at reaching the 120,000 death toll which was surely certain to have been totally skewed all along, but what about the human cost of lockdown justified by these 'death figures'? *The British Medical Journal* had reported a 1,493 percent increase in cases of children taken to Great Ormond Street Hospital with abusive head injuries alone and then there was the effect on families:

Perhaps the most shocking thing about all this is that families have been kept apart – and obeyed the most irrational, changing rules at the whim of government – because they believed in the statistics. They succumbed to fear, which his generation rejected in that war fought for freedom. Dad (God rest his soul) would be angry. And so am I.

Another theme to watch is that in the winter months when there are more deaths from all causes they focus on 'Covid' deaths and in the summer when the British Lung Foundation says respiratory disease plummets by 80 percent they rage on about 'cases'. Either way fascism on population is always the answer.

Nazi eugenics in the 21st century

Elderly people in care homes have been isolated from their families month after lonely month with no contact with relatives and grandchildren who were banned from seeing them. We were told

that lockdown fascism was to 'protect the vulnerable' like elderly people. At the same time Do Not Resuscitate (DNR) orders were placed on their medical files so that if they needed resuscitation it wasn't done and 'Covid-19' went on their death certificates. Old people were not being 'protected' they were being culled – murdered in truth. DNR orders were being decreed for disabled and young people with learning difficulties or psychological problems. The UK Care Quality Commission, a non-departmental body of the Department of Health and Social Care, found that 34 percent of those working in health and social care were pressured into placing 'do not attempt cardiopulmonary resuscitation' orders on 'Covid' patients who suffered from disabilities and learning difficulties without involving the patient or their families in the decision. UK judges ruled that an elderly woman with dementia should have the DNA-manipulating 'Covid vaccine' against her son's wishes and that a man with severe learning difficulties should have the jab despite his family's objections. Never mind that many had already died. The judiciary always supports doctors and government in fascist dictatorships. They wouldn't dare do otherwise. A horrific video was posted showing fascist officers from Los Angeles police forcibly giving the 'Covid' shot to women with special needs who were screaming that they didn't want it. The same fascists are seen giving the jab to a sleeping elderly woman in a care home. This is straight out of the Nazi playbook. Hitler's Nazis committed mass murder of the mentally ill and physically disabled throughout Germany and occupied territories in the programme that became known as Aktion T4, or just T4. Sabbatian-controlled Hitler and his grotesque crazies set out to kill those they considered useless and unnecessary. The Reich Committee for the Scientific Registering of Hereditary and Congenital Illnesses registered the births of babies identified by physicians to have 'defects'. By 1941 alone more than 5,000 children were murdered by the state and it is estimated that in total the number of innocent people killed in Aktion T4 was between 275,000 and 300,000. Parents were told their children had been sent away for 'special treatment' never to return. It is rather pathetic to see claims about plans for new extermination camps being dismissed today

when the same force behind current events did precisely that 80 years ago. Margaret Sanger was a Cult operative who used 'birth control' to sanitise her programme of eugenics. Organisations she founded became what is now Planned Parenthood. Sanger proposed that 'the whole dysgenic population would have its choice of segregation or sterilization'. These included epileptics, 'feeble-minded', and prostitutes. Sanger opposed charity because it perpetuated 'human waste'. She reveals the Cult mentality and if anyone thinks that extermination camps are a 'conspiracy theory' their naivety is touching if breathtakingly stupid.

If you don't believe that doctors can act with callous disregard for their patients it is worth considering that doctors and medical staff agreed to put government-decreed DNR orders on medical files and do nothing when resuscitation is called for. I don't know what you call such people in your house. In mine they are Nazis from the Josef Mengele School of Medicine. Phenomenal numbers of old people have died worldwide from the effects of lockdown, depression, lack of treatment, the 'vaccine' (more later) and losing the will to live. A common response at the start of the manufactured pandemic was to remove old people from hospital beds and transfer them to nursing homes. The decision would result in a mass cull of elderly people in those homes through lack of treatment – *not* 'Covid'. Care home whistleblowers have told how once the 'Covid' era began doctors would not come to their homes to treat patients and they were begging for drugs like antibiotics that often never came. The most infamous example was ordered by New York governor Andrew Cuomo, brother of a moronic CNN host, who amazingly was given an Emmy Award for his handling of the 'Covid crisis' by the ridiculous Wokers that hand them out. Just how ridiculous could be seen in February, 2021, when a Department of Justice and FBI investigation began into how thousands of old people in New York died in nursing homes after being discharged from hospital to make way for 'Covid' patients on Cuomo's say-so – and how he and his staff covered up these facts. This couldn't have happened to a nicer psychopath. Even then there was a 'Covid' spin. Reports said that

thousands of old people who tested positive for 'Covid' in hospital were transferred to nursing homes to both die of 'Covid' and transmit it to others. No – they were in hospital because they were ill and the fact that they tested positive with a test not testing for the 'virus' is irrelevant. They were ill often with respiratory diseases ubiquitous in old people near the end of their lives. Their transfer out of hospital meant that their treatment stopped and many would go on to die.

They're old. Who gives a damn?

I have exposed in the books for decades the Cult plan to cull the world's old people and even to introduce at some point what they call a 'demise pill' which at a certain age everyone would take and be out of here by law. In March, 2021, Spain legalised euthanasia and assisted suicide following the Netherlands, Belgium, Luxembourg and Canada on the Tiptoe to the demise pill. Treatment of old people by many 'care' homes has been a disgrace in the 'Covid' era. There are many, many, caring staff – I know some. There have, however, been legions of stories about callous treatment of old people and their families. Police were called when families came to take their loved ones home in the light of isolation that was killing them. They became prisoners of the state. Care home residents in insane, fascist Ontario, Canada, were not allowed to leave their *room* once the 'Covid' hoax began. UK staff have even wheeled elderly people away from windows where family members were talking with them. Oriana Criscuolo from Stockport in the English North West dropped off some things for her 80-year-old father who has Parkinson's disease and dementia and she wanted to wave to him through a ground-floor window. She was told that was 'illegal'. When she went anyway they closed the curtains in the middle of the day. Oriana said:

> It's just unbelievable. I cannot understand how care home staff – people who are being paid to care – have become so uncaring. Their behaviour is inhumane and cruel. It's beyond belief.

She was right and this was not a one-off. What a way to end your life in such loveless circumstances. UK registered nurse Nicky Millen, a proper old school nurse for 40 years, said that when she started her career care was based on dignity, choice, compassion and empathy. Now she said 'the things that are important to me have gone out of the window.' She was appalled that people were dying without their loved ones and saying goodbye on iPads. Nicky described how a distressed 89-year-old lady stroked her face and asked her 'how many paracetamol would it take to finish me off'. Life was no longer worth living while not seeing her family. Nicky said she was humiliated in front of the ward staff and patients for letting the lady stroke her face and giving her a cuddle. Such is the dehumanisation that the 'Covid' hoax has brought to the surface. Nicky worked in care homes where patients told her they were being held prisoner. 'I want to live until I die', one said to her. 'I had a lady in tears because she hadn't seen her great-grandson.' Nicky was compassionate old school meeting psychopathic New Normal. She also said she had worked on a 'Covid' ward with no 'Covid' patients. Jewish writer Shai Held wrote an article in March, 2020, which was headlined 'The Staggering, Heartless Cruelty Toward the Elderly'. What he described was happening from the earliest days of lockdown. He said 'the elderly' were considered a group and not unique individuals (the way of the Woke). Shai Held said:

Notice how the all-too-familiar rhetoric of dehumanization works: 'The elderly' are bunched together as a faceless mass, all of them considered culprits and thus effectively deserving of the suffering the pandemic will inflict upon them. Lost entirely is the fact that the elderly are individual human beings, each with a distinctive face and voice, each with hopes and dreams, memories and regrets, friendships and marriages, loves lost and loves sustained.

'The elderly' have become another dehumanised group for which anything goes and for many that has resulted in cold disregard for their rights and their life. The distinctive face that Held talks about is designed to be deleted by masks until everyone is part of a faceless mass.

‘War-zone’ hospitals myth

Again and again medical professionals have told me what was really going on and how hospitals ‘overrun like war zones’ according to the media were virtually empty. The mantra from medical whistleblowers was please don’t use my name or my career is over. Citizen journalists around the world sneaked into hospitals to film evidence exposing the ‘war-zone’ lie. They really *were* largely empty with closed wards and operating theatres. I met a hospital worker in my town on the Isle of Wight during the first lockdown in 2020 who said the only island hospital had never been so quiet. Lockdown was justified by the psychopaths to stop hospitals being overrun. At the same time that the island hospital was near-empty the military arrived here to provide *extra beds*. It was all propaganda to ramp up the fear to ensure compliance with fascism as were never-used temporary hospitals with thousands of beds known as Nightingales and never-used make-shift mortuaries opened by the criminal UK government. A man who helped to install those extra island beds attributed to the army said they were never used and the hospital was empty. Doctors and nurses ‘stood around talking or on their phones, wandering down to us to see what we were doing’. There were no masks or social distancing. He accused the useless local island paper, the *County Press*, of ‘pumping the fear as if our hospital was overrun and we only have one so it should have been’. He described ambulances parked up with crews outside in deck chairs. When his brother called an ambulance he was told there was a two-hour backlog which he called ‘bullshit’. An old lady on the island fell ‘and was in a bad way’, but a caller who rang for an ambulance was told the situation wasn’t urgent enough. Ambulance stations were working under capacity while people would hear ambulances with sirens blaring driving through the streets. When those living near the stations realised what was going on they would follow them as they left, circulated around an urban area with the sirens going, and then came back without stopping. All this was to increase levels of fear and the same goes for the ‘ventilator shortage crisis’ that cost tens of millions for hastily produced ventilators never to be used.

Ambulance crews that agreed to be exploited in this way for fear propaganda might find themselves a mirror. I wish them well with that. Empty hospitals were the obvious consequence of treatment and diagnoses of non-'Covid' conditions cancelled and those involved handed a death sentence. People have been dying at home from undiagnosed and untreated cancer, heart disease and other life-threatening conditions to allow empty hospitals to deal with a 'pandemic' that wasn't happening.

Death of the innocent

'War-zones' have been laying off nursing staff, even doctors where they can. There was no work for them. Lockdown was justified by saving lives and protecting the vulnerable they were actually killing with DNR orders and preventing empty hospitals being 'overrun'. In Britain the mantra of stay at home to 'save the NHS' was everywhere and across the world the same story was being sold when it was all lies. Two California doctors, Dan Erickson and Artin Massihi at Accelerated Urgent Care in Bakersfield, held a news conference in April, 2020, to say that intensive care units in California were 'empty, essentially', with hospitals shutting floors, not treating patients and laying off doctors. The California health system was working at minimum capacity 'getting rid of doctors because we just don't have the volume'. They said that people with conditions such as heart disease and cancer were not coming to hospital out of fear of 'Covid-19'. Their video was deleted by Susan Wojcicki's Cult-owned YouTube after reaching five million views. Florida governor Ron Desantis, who rejected the severe lockdowns of other states and is being targeted for doing so, said that in March, 2020, every US governor was given models claiming they would run out of hospital beds in days. That was never going to happen and the 'modellers' knew it. Deceit can be found at every level of the system. Urgent children's operations were cancelled including fracture repairs and biopsies to spot cancer. Eric Nicholls, a consultant paediatrician, said 'this is obviously concerning and we need to return to normal operating and to increase capacity as soon as possible'. Psychopaths

in power were rather less concerned *because* they are psychopaths. Deletion of urgent care and diagnosis has been happening all over the world and how many kids and others have died as a result of the actions of these cold and heartless lunatics dictating 'health' policy? The number must be stratospheric. Richard Sullivan, professor of cancer and global health at King's College London, said people feared 'Covid' more than cancer such was the campaign of fear. 'Years of lost life will be quite dramatic', Sullivan said, with 'a huge amount of avoidable mortality'. Sarah Woolnough, executive director for policy at Cancer Research UK, said there had been a 75 percent drop in urgent referrals to hospitals by family doctors of people with suspected cancer. Sullivan said that 'a lot of services have had to scale back – we've seen a dramatic decrease in the amount of elective cancer surgery'. Lockdown deaths worldwide has been absolutely fantastic with the *New York Post* reporting how data confirmed that 'lockdowns end more lives than they save':

> There was a sharp decline in visits to emergency rooms and an increase in fatal heart attacks because patients didn't receive prompt treatment. Many fewer people were screened for cancer. Social isolation contributed to excess deaths from dementia and Alzheimer's.
>
> Researchers predicted that the social and economic upheaval would lead to tens of thousands of "deaths of despair" from drug overdoses, alcoholism and suicide. As unemployment surged and mental-health and substance-abuse treatment programs were interrupted, the reported levels of anxiety, depression and suicidal thoughts increased dramatically, as did alcohol sales and fatal drug overdoses.

This has been happening while nurses and other staff had so much time on their hands in the 'war-zones' that Tic-Tok dancing videos began appearing across the Internet with medical staff dancing around in empty wards and corridors as people died at home from causes that would normally have been treated in hospital.

Mentions in dispatches

One brave and truth-committed whistleblower was Louise Hampton, a call handler with the UK NHS who made a viral Internet video saying she had done 'fuck all' during the 'pandemic'

which was 'a load of bollocks'. She said that 'Covid-19' was rebranded flu and of course she lost her job. This is what happens in the medical and endless other professions now when you tell the truth. Louise filmed inside 'war-zone' accident and emergency departments to show they were empty and I mean *empty* as in no one there. The mainstream media could have done the same and blown the gaff on the whole conspiracy. They haven't to their eternal shame. Not that most 'journalists' seem capable of manifesting shame as with the psychopaths they slavishly repeat without question. The relative few who were admitted with serious health problems were left to die alone with no loved ones allowed to see them because of 'Covid' rules and they included kids dying without the comfort of mum and dad at their bedside while the evil behind this couldn't give a damn. It was all good fun to them. A Scottish NHS staff nurse publicly quit in the spring of 2021 saying: 'I can no longer be part of the lies and the corruption by the government.' She said hospitals 'aren't full, the beds aren't full, beds have been shut, wards have been shut'. Hospitals were never busy throughout 'Covid'. The staff nurse said that Nicola Sturgeon, tragically the leader of the Scottish government, was on television saying save the hospitals and the NHS – 'but the beds are empty' and 'we've not seen flu, we always see flu every year'. She wrote to government and spoke with her union Unison (the unions are Cult-compromised and *useless*, but nothing changed. Many of her colleagues were scared of losing their jobs if they spoke out as they wanted to. She said nursing staff were being affected by wearing masks all day and 'my head is splitting every shift from wearing a mask'. The NHS is part of the fascist tyranny and must be dismantled so we can start again with human beings in charge. (Ironically, hospitals were reported to be busier again when official 'Covid' cases *fell* in spring/summer of 2021 and many other conditions required treatment at the same time as *the fake vaccine rollout*.)

I will cover the 'Covid vaccine' scam in detail later, but it is another indicator of the sickening disregard for human life that I am highlighting here. The DNA-manipulating concoctions do not fulfil

the definition of a 'vaccine', have never been used on humans before and were given only emergency approval because trials were not completed and they continued using the unknowing public. The result was what a NHS senior nurse with responsibility for 'vaccine' procedure said was 'genocide'. She said the 'vaccines' were not 'vaccines'. They had not been shown to be safe and claims about their effectiveness by drug companies were 'poetic licence'. She described what was happening as a 'horrid act of human annihilation'. The nurse said that management had instigated a policy of not providing a Patient Information Leaflet (PIL) before people were 'vaccinated' even though health care professionals are supposed to do this according to protocol. Patients should also be told that they are taking part in an ongoing clinical trial. Her challenges to what is happening had seen her excluded from meetings and ridiculed in others. She said she was told to 'watch my step … or I would find myself surplus to requirements'. The nurse, who spoke anonymously in fear of her career, said she asked her NHS manager why he/she was content with taking part in genocide against those having the 'vaccines'. The reply was that everyone had to play their part and to 'put up, shut up, and get it done'. Government was 'leaning heavily' on NHS management which was clearly leaning heavily on staff. This is how the global 'medical' hierarchy operates and it starts with the Cult and its World Health Organization.

She told the story of a doctor who had the Pfizer jab and when questioned had no idea what was in it. The doctor had never read the literature. We have to stop treating doctors as intellectual giants when so many are moral and medical pygmies. The doctor did not even know that the 'vaccines' were not fully approved or that their trials were ongoing. They were, however, asking their patients if they minded taking part in follow-ups for research purposes – yes, the *ongoing clinical trial*. The nurse said the doctor's ignorance was not rare and she had spoken to a hospital consultant who had the jab without any idea of the background or that the 'trials' had not been completed. Nurses and pharmacists had shown the same ignorance.

'My NHS colleagues have forsaken their duty of care, broken their code of conduct – Hippocratic Oath – and have been brainwashed just the same as the majority of the UK public through propaganda …' She said she had not been able to recruit a single NHS colleague, doctor, nurse or pharmacist to stand with her and speak out. Her union had refused to help. She said that if the genocide came to light she would not hesitate to give evidence at a Nuremberg-type trial against those in power who could have affected the outcomes but didn't.

And all for what?

To put the nonsense into perspective let's say the 'virus' does exist and let's go completely crazy and accept that the official manipulated figures for cases and deaths are accurate. *Even then* a study by Stanford University epidemiologist Dr John Ioannidis published on the World Health Organization website produced an average infection to fatality rate of … *0.23 percent!* Ioannidis said: 'If one could sample equally from all locations globally, the median infection fatality rate might even be substantially lower than the 0.23% observed in my analysis.' For healthy people under 70 it was … *0.05 percent*! This compares with the 3.4 percent claimed by the Cult-owned World Health Organization when the hoax was first played and maximum fear needed to be generated. An updated Stanford study in April, 2021, put the 'infection' to 'fatality' rate at just 0.15 percent. Another team of scientists led by Megan O'Driscoll and Henrik Salje studied data from 45 countries and published their findings on the Nature website. For children and young people the figure is so small it virtually does not register although authorities will be hyping dangers to the young when they introduce DNA-manipulating 'vaccines' for children. The O'Driscoll study produced an average infection-fatality figure of 0.003 for children from birth to four; 0.001 for 5 to 14; 0.003 for 15 to 19; and it was still only 0.456 up to 64. To claim that children must be 'vaccinated' to protect them from 'Covid' is an obvious lie and so there must be another reason and there is. What's more the average age of a 'Covid' death is akin

to the average age that people die in general. The average age of death in England is about 80 for men and 83 for women. The average age of death from alleged 'Covid' is between 82 and 83. California doctors, Dan Erickson and Artin Massihi, said at their April media conference that projection models of millions of deaths had been 'woefully inaccurate'. They produced detailed figures showing that Californians had a 0.03 chance of dying from 'Covid' based on the number of people who tested positive (with a test not testing for the 'virus'). Erickson said there was a 0.1 percent chance of dying from 'Covid' in the *state* of New York, not just the city, and a 0.05 percent chance in Spain, a centre of 'Covid-19' hysteria at one stage. The Stanford studies supported the doctors' data with fatality rate estimates of 0.23 and 0.15 percent. How close are these figures to my estimate of *zero*? Death-rate figures claimed by the World Health Organization at the start of the hoax were some 15 times higher. The California doctors said there was no justification for lockdowns and the economic devastation they caused. Everything they had ever learned about quarantine was that you quarantine the *sick* and not the healthy. They had never seen this before and it made no medical sense.

Why in the in the light of all this would governments and medical systems the world over say that billions must go under house arrest; lose their livelihood; in many cases lose their mind, their health and their life; force people to wear masks dangerous to health and psychology; make human interaction and even family interaction a criminal offence; ban travel; close restaurants, bars, watching live sport, concerts, theatre, and any activity involving human togetherness and discourse; and closing schools to isolate children from their friends and cause many to commit suicide in acts of hopelessness and despair? The California doctors said lockdown consequences included increased child abuse, partner abuse, alcoholism, depression, and other impacts they were seeing every day. Who would do that to the entire human race if not mentally-ill psychopaths of almost unimaginable extremes like Bill Gates? We must face the reality of what we are dealing with and come out of

denial. Fascism and tyranny are made possible only by the target population submitting and acquiescing to fascism and tyranny. The whole of human history shows that to be true. Most people naively and unquestioning believed what they were told about a 'deadly virus' and meekly and weakly submitted to house arrest. Those who didn't believe it – at least in total – still submitted in fear of the consequences of not doing so. For the rest who wouldn't submit draconian fines have been imposed, brutal policing by psychopaths *for* psychopaths, and condemnation from the meek and weak who condemn the Pushbackers on behalf of the very force that has them, too, in its gunsights. 'Pathetic' does not even begin to suffice. Britain's brainless 'Health' Secretary Matt Hancock warned anyone lying to border officials about returning from a list of 'hotspot' countries could face a jail sentence of up to ten years which is more than for racially-aggravated assault, incest and attempting to have sex with a child under 13. Hancock is a lunatic, but he has the state apparatus behind him in a Cult-led chain reaction and the same with UK 'Vaccine Minister' Nadhim Zahawi, a prominent member of the mega-Cult secret society, Le Cercle, which featured in my earlier books. The Cult enforces its will on governments and medical systems; government and medical systems enforce their will on business and police; business enforces its will on staff who enforce it on customers; police enforce the will of the Cult on the population and play their essential part in creating a world of fascist control that their own children and grandchildren will have to live in their entire lives. It is a hierarchical pyramid of imposition and acquiescence and, yes indeedy, of clinical insanity.

Does anyone bright enough to read this book have to ask what the answer is? I think not, but I will reveal it anyway in the fewest of syllables: Tell the psychos and their moronic lackeys to fuck off and let's get on with our lives. We are many – They are few.

CHAPTER SEVEN

War on your mind

One believes things because one has been conditioned to believe them
Aldous Huxley, *Brave New World*

I have described the 'Covid' hoax as a 'Psyop' and that is true in every sense and on every level in accordance with the definition of that term which is psychological warfare. Break down the 'Covid pandemic' to the foundation themes and it is psychological warfare on the human individual and collective mind.

The same can be said for the entire human belief system involving every subject you can imagine. Huxley was right in his contention that people believe what they are conditioned to believe and this comes from the repetition throughout their lives of the same falsehoods. They spew from government, corporations, media and endless streams of 'experts' telling you what the Cult wants you to believe and often believing it themselves (although *far* from always). 'Experts' are rewarded with 'prestigious' jobs and titles and as agents of perceptual programming with regular access to the media. The Cult has to control the narrative – control *information* – or they lose control of the vital, crucial, without-which-they-cannot-prevail public perception of reality. The foundation of that control today is the Internet made possible by the Defense Advanced Research Projects Agency (DARPA), the incredibly sinister technological arm of the Pentagon. The Internet is the result of military technology.

DARPA openly brags about establishing the Internet which has been a long-term project to lasso the minds of the global population. I have said for decades the plan is to control information to such an extreme that eventually no one would see or hear anything that the Cult does not approve. We are closing in on that end with ferocious censorship since the 'Covid' hoax began and in my case it started back in the 1990s in terms of books and speaking venues. I had to create my own publishing company in 1995 precisely because no one else would publish my books even then. I think they're all still running.

Cult Internet

To secure total control of information they needed the Internet in which pre-programmed algorithms can seek out 'unclean' content for deletion and even stop it being posted in the first place. The Cult had to dismantle print and non-Internet broadcast media to ensure the transfer of information to the appropriate-named 'Web' – a critical expression of the *Cult* web. We've seen the ever-quickening demise of traditional media and control of what is left by a tiny number of corporations operating worldwide. Independent journalism in the mainstream is already dead and never was that more obvious than since the turn of 2020. The Cult wants all information communicated via the Internet to globally censor and allow the plug to be pulled any time. Lockdowns and forced isolation has meant that communication between people has been through electronic means and no longer through face-to-face discourse and discussion. Cult psychopaths have targeted the bars, restaurants, sport, venues and meeting places in general for this reason. None of this is by chance and it's to stop people gathering in any kind of privacy or number while being able to track and monitor all Internet communications and block them as necessary. Even private messages between individuals have been censored by these fascists that control Cult fronts like Facebook, Twitter, Google and YouTube which are all officially run by Sabbatian place-people and from the background by higher-level Sabbatian place people.

Facebook, Google, Amazon and their like were seed-funded and supported into existence with money-no-object infusions of funds either directly or indirectly from DARPA and CIA technology arm In-Q-Tel. The Cult plays the long game and prepares very carefully for big plays like 'Covid'. Amazon is another front in the psychological war and pretty much controls the global market in book sales and increasingly publishing. Amazon's limitless funds have deleted fantastic numbers of independent publishers to seize global domination on the way to deciding which books can be sold and circulated and which cannot. Moves in that direction are already happening. Amazon's leading light Jeff Bezos is the grandson of Lawrence Preston Gise who worked with DARPA predecessor ARPA. Amazon has big connections to the CIA and the Pentagon. The plan I have long described went like this:

1. Employ military technology to establish the Internet.

2. Sell the Internet as a place where people can freely communicate without censorship and allow that to happen until the Net becomes the central and irreversible pillar of human society. If the Internet had been highly censored from the start many would have rejected it.

3. Fund and manipulate major corporations into being to control the circulation of information on your Internet using cover stories about geeks in garages to explain how they came about. Give them unlimited funds to expand rapidly with no need to make a profit for years while non-Cult companies who need to balance the books cannot compete. You know that in these circumstances your Googles, YouTubes, Facebooks and Amazons are going to secure near monopolies by either crushing or buying up the opposition.

4. Allow freedom of expression on both the Internet and communication platforms to draw people in until the Internet is the central and irreversible pillar of human society and your communication corporations have reached a stage of near monopoly domination.

5. Then unleash your always-planned frenzy of censorship on the basis of 'where else are you going to go?' and continue to expand that until nothing remains that the Cult does not want its human targets to see.

The process was timed to hit the 'Covid' hoax to ensure the best chance possible of controlling the narrative which they knew they had to do at all costs. They were, after all, about to unleash a 'deadly virus' that didn't really exist. If you do that in an environment of free-flowing information and opinion you would be dead in the

water before you could say Gates is a psychopath. The network was in place through which the Cult-created-and-owned World Health Organization could dictate the 'Covid' narrative and response policy slavishly supported by Cult-owned Internet communication giants and mainstream media while those telling a different story were censored. Google, YouTube, Facebook and Twitter openly announced that they would do this. What else would we expect from Cult-owned operations like Facebook which former executives have confirmed set out to make the platform more addictive than cigarettes and coldly manipulates emotions of its users to sow division between people and groups and scramble the minds of the young? If Zuckerberg lives out the rest of his life without going to jail for crimes against humanity, and most emphatically against the young, it will be a travesty of justice. Still, no matter, cause and effect will catch up with him eventually and the same with Sergey Brin and Larry Page at Google with its CEO Sundar Pichai who fix the Google search results to promote Cult narratives and hide the opposition. Put the same key words into Google and other search engines like DuckDuckGo and you will see how different results can be. Wikipedia is another intensely biased 'encyclopaedia' which skews its content to the Cult agenda. YouTube links to Wikipedia's version of 'Covid' and 'climate change' on video pages in which experts in their field offer a different opinion (even that is increasingly rare with Wojcicki censorship). Into this 'Covid' silence-them network must be added government media censors, sorry 'regulators', such as Ofcom in the UK which imposed tyrannical restrictions on British broadcasters that had the effect of banning me from ever appearing. Just to debate with me about my evidence and views on 'Covid' would mean breaking the fascistic impositions of Ofcom and its CEO career government bureaucrat Melanie Dawes. Gutless British broadcasters tremble at the very thought of fascist Ofcom.

Psychos behind 'Covid'

The reason for the 'Covid' catastrophe in all its facets and forms can be seen by whom and what is driving the policies worldwide in such a coordinated way. Decisions are not being made to protect health, but to target psychology. The dominant group guiding and 'advising' government policy are not medical professionals. They are psychologists and behavioural scientists. Every major country has its own version of this phenomenon and I'll use the British example to show how it works. In many ways the British version has been affecting the wider world in the form of the huge behaviour manipulation network in the UK which operates in other countries. The network involves private companies, government, intelligence and military. The Cabinet Office is at the centre of the government 'Covid' Psyop and part-owns, with 'innovation charity' Nesta, the Behavioural Insights Team (BIT) which claims to be independent of government but patently isn't. The BIT was established in 2010 and its job is to manipulate the psyche of the population to acquiesce to government demands and so much more. It is also known as the 'Nudge Unit', a name inspired by the 2009 book by two ultra-Zionists, Cass Sunstein and Richard Thaler, called *Nudge: Improving Decisions About Health, Wealth, and Happiness*. The book, as with the Behavioural Insights Team, seeks to 'nudge' behaviour (manipulate it) to make the public follow patterns of action and perception that suit those in authority (the Cult). Sunstein is so skilled at this that he advises the World Health Organization and the UK Behavioural Insights Team and was Administrator of the White House Office of Information and Regulatory Affairs in the Obama administration. Biden appointed him to the Department of Homeland Security – another ultra-Zionist in the fold to oversee new immigration laws which is another policy the Cult wants to control. Sunstein is desperate to silence anyone exposing conspiracies and co-authored a 2008 report on the subject in which suggestions were offered to ban 'conspiracy theorizing' or impose 'some kind of tax, financial or otherwise, on those who disseminate such theories'. I guess a psychiatrist's chair is out of the question?

Sunstein's mate Richard Thaler, an 'academic affiliate' of the UK Behavioural Insights Team, is a proponent of 'behavioural economics' which is defined as the study of 'the effects of psychological, cognitive, emotional, cultural and social factors on the decisions of individuals and institutions'. Study the effects so they can be manipulated to be what you want them to be. Other leading names in the development of behavioural economics are ultra-Zionists Daniel Kahneman and Robert J. Shiller and they, with Thaler, won the Nobel Memorial Prize in Economic Sciences for their work in this field. The Behavioural Insights Team is operating at the heart of the UK government and has expanded globally through partnerships with several universities including Harvard, Oxford, Cambridge, University College London (UCL) and Pennsylvania. They claim to have 'trained' (reframed) 20,000 civil servants and run more than 750 projects involving 400 randomised controlled trials in dozens of countries' as another version of mind reframers Common Purpose. BIT works from its office in New York with cities and their agencies, as well as other partners, across the United States and Canada – this is a company part-owned by the British government Cabinet Office. An executive order by President Cult-servant Obama established a US Social and Behavioral Sciences Team in 2015. They all have the same reason for being and that's to brainwash the population directly and by brainwashing those in positions of authority.

'Covid' mind game

Another prime aspect of the UK mind-control network is the 'independent' [joke] Scientific Pandemic Insights Group on Behaviours (SPI-B) which 'provides behavioural science advice aimed at anticipating and helping people adhere to interventions that are recommended by medical or epidemiological experts'. That means manipulating public perception and behaviour to do whatever government tells them to do. It's disgusting and if they really want the public to be 'safe' this lot should all be under lock and key. According to the government website SPI-B consists of

'behavioural scientists, health and social psychologists, anthropologists and historians' and advises the Whitty-Vallance-led Scientific Advisory Group for Emergencies (SAGE) which in turn advises the government on 'the science' (it doesn't) and 'Covid' policy. When politicians say they are being guided by 'the science' this is the rabble in each country they are talking about and that 'science' is dominated by behaviour manipulators to enforce government fascism through public compliance. The Behaviour Insight Team is headed by psychologist David Solomon Halpern, a visiting professor at King's College London, and connects with a national and global web of other civilian and military organisations as the Cult moves towards its goal of fusing them into one fascistic whole in every country through its 'Fusion Doctrine'. The behaviour manipulation network involves, but is not confined to, the Foreign Office; National Security Council; government communications headquarters (GCHQ); MI5; MI6; the Cabinet Office-based Media Monitoring Unit; and the Rapid Response Unit which 'monitors digital trends to spot emerging issues; including misinformation and disinformation; and identifies the best way to respond'.

There is also the 77th Brigade of the UK military which operates like the notorious Israeli military's Unit 8200 in manipulating information and discussion on the Internet by posing as members of the public to promote the narrative and discredit those who challenge it. Here we have the military seeking to manipulate *domestic* public opinion while the Nazis in government are fine with that. Conservative Member of Parliament Tobias Ellwood, an advocate of lockdown and control through 'vaccine passports', is a Lieutenant Colonel reservist in the 77th Brigade which connects with the military operation jHub, the 'innovation centre' for the Ministry of Defence and Strategic Command. jHub has also been involved with the civilian National Health Service (NHS) in 'symptom tracing' the population. The NHS is a key part of this mind control network and produced a document in December, 2020, explaining to staff how to use psychological manipulation with different groups and ages to get them to have the DNA-manipulating 'Covid vaccine'

that's designed to cumulatively rewrite human genetics. The document, called 'Optimising Vaccination Roll Out – Do's and Dont's for all messaging, documents and "communications" in the widest sense', was published by NHS England and the NHS Improvement *Behaviour Change Unit* in partnership with Public Health England and Warwick Business School. I hear the mantra about 'save the NHS' and 'protect the NHS' when we need to scrap the NHS and start again. The current version is far too corrupt, far too anti-human and totally compromised by Cult operatives and their assets. UK government broadcast media censor Ofcom will connect into this web – as will the BBC with its tremendous Ofcom influence – to control what the public see and hear and dictate mass perception. Nuremberg trials must include personnel from all these organisations.

The fear factor

The 'Covid' hoax has led to the creation of the UK Cabinet Office-connected Joint Biosecurity Centre (JBC) which is officially described as providing 'expert advice on pandemics' using its independent [all Cult operations are 'independent'] analytical function to provide real-time analysis about infection outbreaks to identify and respond to outbreaks of Covid-19'. Another role is to advise the government on a response to spikes in infections – 'for example by closing schools or workplaces in local areas where infection levels have risen'. Put another way, promoting the Cult agenda. The Joint Biosecurity Centre is modelled on the Joint Terrorism Analysis Centre which analyses intelligence to set 'terrorism threat levels' and here again you see the fusion of civilian and military operations and intelligence that has led to military intelligence producing documents about 'vaccine hesitancy' and how it can be combated. Domestic civilian matters and opinions should not be the business of the military. The Joint Biosecurity Centre is headed by Tom Hurd, director general of the Office for Security and Counter-Terrorism from the establishment-to-its-fingertips Hurd family. His father is former Foreign Secretary Douglas Hurd. How coincidental that Tom

Hurd went to the elite Eton College and Oxford University with Boris Johnson. Imperial College with its ridiculous computer modeller Neil Ferguson will connect with this gigantic web that will itself interconnect with similar set-ups in other major and not so major countries. Compared with this Cult network the politicians, be they Boris Johnson, Donald Trump or Joe Biden, are bit-part players 'following the science'. The network of psychologists was on the 'Covid' case from the start with the aim of generating maximum fear of the 'virus' to ensure compliance by the population. A government behavioural science group known as SPI-B produced a paper in March, 2020, for discussion by the main government science advisory group known as SAGE. It was headed 'Options for increasing adherence to social distancing measures' and it said the following in a section headed 'Persuasion':

- A substantial number of people still do not feel sufficiently personally threatened; it could be that they are reassured by the low death rate in their demographic group, although levels of concern may be rising. Having a good understanding of the risk has been found to be positively associated with adoption of COVID-19 social distancing measures in Hong Kong.

- The perceived level of personal threat needs to be increased among those who are complacent, using hard-hitting evaluation of options for increasing social distancing emotional messaging. To be effective this must also empower people by making clear the actions they can take to reduce the threat.

- Responsibility to others: There seems to be insufficient understanding of, or feelings of responsibility about, people's role in transmitting the infection to others … Messaging about actions need to be framed positively in terms of protecting oneself and the community, and increase confidence that they will be effective.

- Some people will be more persuaded by appeals to play by the rules, some by duty to the community, and some to personal risk.

> All these different approaches are needed. The messaging also needs to take account of the realities of different people's lives. Messaging needs to take account of the different motivational levers and circumstances of different people.

All this could be achieved the SPI-B psychologists said by *using the media to increase the sense of personal threat* which translates as terrify the shit out of the population, including children, so they all do what we want. That's not happened has it? Those excuses for 'journalists' who wouldn't know journalism if it bit them on the arse (the great majority) have played their crucial part in serving this Cult-government Psyop to enslave their own kids and grandkids. How they live with themselves I have no idea. The psychological war has been underpinned by constant government 'Covid' propaganda in almost every television and radio ad break, plus the Internet and print media, which has pounded out the fear with taxpayers footing the bill for their own programming. The result has been people terrified of a 'virus' that doesn't exist or one with a tiny fatality rate even if you believe it does. People walk down the street and around the shops wearing face-nappies damaging their health and psychology while others report those who refuse to be that naïve to the police who turn up in their own face-nappies. I had a cameraman come to my flat and he was so frightened of 'Covid' he came in wearing a mask and refused to shake my hand in case he caught something. He had – naïveitis – and the thought that he worked in the mainstream media was both depressing and made his behaviour perfectly explainable. The fear which has gripped the minds of so many and frozen them into compliance has been carefully cultivated by these psychologists who are really psychopaths. If lives get destroyed and a lot of young people commit suicide it shows our plan is working. SPI-B then turned to compulsion on the public to comply. 'With adequate preparation, rapid change can be achieved', it said. Some countries had introduced mandatory self-isolation on a wide scale without evidence of major public unrest and a large majority of the UK's population appeared to be supportive of more coercive measures with 64 percent of adults saying they would

support putting London under a lockdown (watch the 'polls' which are designed to make people believe that public opinion is in favour or against whatever the subject in hand).

For 'aggressive protective measures' to be effective, the SPI-B paper said, special attention should be devoted to those population groups that are more at risk. Translated from the Orwellian this means making the rest of population feel guilty for not protecting the 'vulnerable' such as old people which the Cult and its agencies were about to kill on an industrial scale with lockdown, lack of treatment and the Gates 'vaccine'. Psychopath psychologists sold their guilt-trip so comprehensively that Los Angeles County Supervisor Hilda Solis reported that children were apologising (from a distance) to their parents and grandparents for bringing 'Covid' into their homes and getting them sick. '… These apologies are just some of the last words that loved ones will ever hear as they die alone,' she said. Gut-wrenchingly Solis then used this childhood tragedy to tell children to stay at home and 'keep your loved ones alive'. Imagine heaping such potentially life-long guilt on a kid when it has absolutely nothing to do with them. These people are deeply disturbed and the psychologists behind this even more so.

Uncivil war – divide and rule

Professional mind-controllers at SPI-B wanted the media to increase a sense of responsibility to others (do as you're told) and promote 'positive messaging' for those actions while in contrast to invoke 'social disapproval' by the unquestioning, obedient, community of anyone with a mind of their own. Again the compliant Goebbels-like media obliged. This is an old, old, trick employed by tyrannies the world over throughout human history. You get the target population to keep the target population in line – *your* line. SPI-B said this could 'play an important role in preventing anti-social behaviour or discouraging failure to enact pro-social behaviour'. For 'anti-social' in the Orwellian parlance of SPI-B see any behaviour that government doesn't approve. SPI-B recommendations said that 'social disapproval' should be accompanied by clear messaging and

promotion of strong collective identity – hence the government and celebrity mantra of 'we're all in this together'. Sure we are. The mind doctors have such contempt for their targets that they think some clueless comedian, actor or singer telling them to do what the government wants will be enough to win them over. We have had UK comedian Lenny Henry, actor Michael Caine and singer Elton John wheeled out to serve the propagandists by urging people to have the DNA-manipulating 'Covid' non-'vaccine'. The role of Henry and fellow black celebrities in seeking to coax a 'vaccine' reluctant black community into doing the government's will was especially stomach-turning. An emotion-manipulating script and carefully edited video featuring these black 'celebs' was such an insult to the intelligence of black people and where's the self-respect of those involved selling their souls to a fascist government agenda? Henry said he heard black people's 'legitimate worries and concerns', but people must 'trust the facts' when they were doing exactly that by not having the 'vaccine'. They had to include the obligatory reference to Black Lives Matter with the line … 'Don't let coronavirus cost even more black lives – because we matter'. My god, it was pathetic. 'I know the vaccine is safe and what it does.' How? 'I'm a comedian and it says so in my script.'

SPI-B said social disapproval needed to be carefully managed to avoid victimisation, scapegoating and misdirected criticism, but they knew that their 'recommendations' would lead to exactly that and the media were specifically used to stir-up the divide-and-conquer hostility. Those who conform like good little baa, baas, are praised while those who have seen through the tidal wave of lies are 'Covidiots'. The awake have been abused by the fast asleep for not conforming to fascism and impositions that the awake know are designed to endanger their health, dehumanise them, and tear asunder the very fabric of human society. We have had the curtain-twitchers and morons reporting neighbours and others to the face-nappied police for breaking 'Covid rules' with fascist police delighting in posting links and phone numbers where this could be done. The Cult cannot impose its will without a compliant police

and military or a compliant population willing to play their part in enslaving themselves and their kids. The words of a pastor in Nazi Germany are so appropriate today:

First they came for the socialists and I did not speak out because I was not a socialist.

Then they came for the trade unionists and I did not speak out because I was not a trade unionist.

Then they came for the Jews and I did not speak out because I was not a Jew.

Then they came for me and there was no one left to speak for me.

Those who don't learn from history are destined to repeat it and so many are.

'Covid' rules: Rewiring the mind

With the background laid out to this gigantic national and global web of psychological manipulation we can put 'Covid' rules into a clear and sinister perspective. Forget the claims about protecting health. 'Covid' rules are about dismantling the human mind, breaking the human spirit, destroying self-respect, and then putting Humpty Dumpty together again as a servile, submissive slave. Social isolation through lockdown and distancing have devastating effects on the human psyche as the psychological psychopaths well know and that's the real reason for them. Humans need contact with each other, discourse, closeness and touch, or they eventually, and literarily, go crazy. Masks, which I will address at some length, fundamentally add to the effects of isolation and the Cult agenda to dehumanise and de-individualise the population. To do this while knowing – in fact *seeking* – this outcome is the very epitome of evil and psychologists involved in this *are* the epitome of evil. They must like all the rest of the Cult demons and their assets stand trial for crimes against humanity on a scale that defies the imagination. Psychopaths in uniform use isolation to break enemy troops and agents and make them subservient and submissive to tell what they know. The technique is rightly considered a form of torture and

torture is most certainly what has been imposed on the human population.

Clinically-insane American psychologist Harry Harlow became famous for his isolation experiments in the 1950s in which he separated baby monkeys from their mothers and imprisoned them for months on end in a metal container or 'pit of despair'. They soon began to show mental distress and depression as any idiot could have predicted. Harlow put other monkeys in steel chambers for three, six or twelve months while denying them any contact with animals or humans. He said that the effects of total social isolation for six months were 'so devastating and debilitating that we had assumed initially that twelve months of isolation would not produce any additional decrement'; but twelve months of isolation 'almost obliterated the animals socially'. This is what the Cult and its psychopaths are doing to you and your children. Even monkeys in partial isolation in which they were not allowed to form relationships with other monkeys became 'aggressive and hostile, not only to others, but also towards their own bodies'. We have seen this in the young as a consequence of lockdown. UK government psychopaths launched a public relations campaign telling people not to hug each other even after they received the 'Covid-19 vaccine' which we were told with more lies would allow a return to 'normal life'. A government source told *The Telegraph*: 'It will be along the lines that it is great that you have been vaccinated, but if you are going to visit your family and hug your grandchildren there is a chance you are going to infect people you love.' The source was apparently speaking from a secure psychiatric facility. Janet Lord, director of Birmingham University's Institute of Inflammation and Ageing, said that parents and grandparents should avoid hugging their children. Well, how can I put it, Ms Lord? Fuck off. Yep, that'll do.

Destroying the kids – where are the parents?

Observe what has happened to people enslaved and isolated by lockdown as suicide and self-harm has soared worldwide,

particularly among the young denied the freedom to associate with their friends. A study of 49,000 people in English-speaking countries concluded that almost half of young adults are at clinical risk of mental health disorders. A national survey in America of 1,000 currently enrolled high school and college students found that 5 percent reported attempting suicide during the pandemic. Data from the US CDC's National Syndromic Surveillance Program from January 1st to October 17th, 2020, revealed a *31 percent* increase in mental health issues among adolescents aged 12 to 17 compared with 2019. The CDC reported that America in general suffered the biggest drop in life expectancy since World War Two as it fell by a year in the first half of 2020 as a result of 'deaths of despair' – overdoses and suicides. Deaths of despair have leapt by more than 20 percent during lockdown and include the highest number of fatal overdoses ever recorded in a single year – 81,000. Internet addiction is another consequence of being isolated at home which lowers interest in physical activities as kids fall into inertia and what's the point? Children and young people are losing hope and giving up on life, sometimes literally. A 14-year-old boy killed himself in Maryland because he had 'given up' when his school district didn't reopen; an 11-year-old boy shot himself during a zoom class; a teenager in Maine succumbed to the isolation of the 'pandemic' when he ended his life after experiencing a disrupted senior year at school. Children as young as nine have taken their life and all these stories can be repeated around the world. Careers are being destroyed before they start and that includes those in sport in which promising youngsters have not been able to take part. The plan of the psycho-psychologists is working all right. Researchers at Cambridge University found that lockdowns cause significant harm to children's mental health. Their study was published in the *Archives of Disease in Childhood*, and followed 168 children aged between 7 and 11. The researchers concluded:

> During the UK lockdown, children's depression symptoms have increased substantially, relative to before lockdown. The scale of this effect has direct relevance for the continuation of different elements of lockdown policy, such as complete or partial school closures …

… Specifically, we observed a statistically significant increase in ratings of depression, with a medium-to-large effect size. Our findings emphasise the need to incorporate the potential impact of lockdown on child mental health in planning the ongoing response to the global pandemic and the recovery from it.

Not a chance when the Cult's psycho-psychologists were getting exactly what they wanted. The UK's Royal College of Paediatrics and Child Health has urged parents to look for signs of eating disorders in children and young people after a three to four fold increase. Specialists say the 'pandemic' is a major reason behind the rise. You don't say. The College said isolation from friends during school closures, exam cancellations, loss of extra-curricular activities like sport, and an increased use of social media were all contributory factors along with fears about the virus (psycho-psychologists again), family finances, and students being forced to quarantine. Doctors said young people were becoming severely ill by the time they were seen with 'Covid' regulations reducing face-to-face consultations. Nor is it only the young that have been devastated by the psychopaths. Like all bullies and cowards the Cult is targeting the young, elderly, weak and infirm. A typical story was told by a British lady called Lynn Parker who was not allowed to visit her husband in 2020 for the last ten and half months of his life 'when he needed me most' between March 20th and when he died on December 19th. This vacates the criminal and enters the territory of evil. The emotional impact on the immune system alone is immense as are the number of people of all ages worldwide who have died as a result of Cult-demanded, Gates-demanded, lockdowns.

Isolation is torture

The experience of imposing solitary confinement on millions of prisoners around the world has shown how a large percentage become 'actively psychotic and/or acutely suicidal'. Social isolation has been found to trigger 'a specific psychiatric syndrome, characterized by hallucinations; panic attacks; overt paranoia; diminished impulse control; hypersensitivity to external stimuli; and difficulties with thinking, concentration and memory'. Juan Mendez,

a United Nations rapporteur (investigator), said that isolation is a form of torture. Research has shown that even after isolation prisoners find it far more difficult to make social connections and I remember chatting to a shop assistant after one lockdown who told me that when her young son met another child again he had no idea how to act or what to do. Hannah Flanagan, Director of Emergency Services at Journey Mental Health Center in Dane County, Wisconsin, said: 'The specificity about Covid social distancing and isolation that we've come across as contributing factors to the suicides are really new to us this year.' But they are not new to those that devised them. They are getting the effect they want as the population is psychologically dismantled to be rebuilt in a totally different way. Children and the young are particularly targeted. They will be the adults when the full-on fascist AI-controlled technocracy is planned to be imposed and they are being prepared to meekly submit. At the same time older people who still have a memory of what life was like before – and how fascist the new normal really is – are being deleted. You are going to see efforts to turn the young against the old to support this geriatric genocide. Hannah Flanagan said the big increase in suicide in her county proved that social isolation is not only harmful, but deadly. Studies have shown that isolation from others is one of the main risk factors in suicide and even more so with women. Warnings that lockdown could create a 'perfect storm' for suicide were ignored. After all this was one of the *reasons* for lockdown. Suicide, however, is only the most extreme of isolation consequences. There are many others. Dr Dhruv Khullar, assistant professor of healthcare policy at Weill Cornell Medical College, said in a *New York Times* article in 2016 long before the fake 'pandemic':

> A wave of new research suggests social separation is bad for us. Individuals with less social connection have disrupted sleep patterns, altered immune systems, more inflammation and higher levels of stress hormones. One recent study found that isolation increases the risk of heart disease by 29 percent and stroke by 32 percent. Another analysis that pooled data from 70 studies and 3.4 million people found that socially isolated individuals had a 30 percent higher risk of dying in the next seven years, and that this effect was largest in middle age.

Loneliness can accelerate cognitive decline in older adults, and isolated individuals are twice as likely to die prematurely as those with more robust social interactions. These effects start early: Socially isolated children have significantly poorer health 20 years later, even after controlling for other factors. All told, loneliness is as important a risk factor for early death as obesity and smoking.

There you have proof from that one article alone four years before 2020 that those who have enforced lockdown, social distancing and isolation knew what the effect would be and that is even more so with professional psychologists that have been driving the policy across the globe. We can go back even further to the years 2000 and 2003 and the start of a major study on the effects of isolation on health by Dr Janine Gronewold and Professor Dirk M. Hermann at the University Hospital in Essen, Germany, who analysed data on 4,316 people with an average age of 59 who were recruited for the long-term research project. They found that socially isolated people are more than 40 percent more likely to have a heart attack, stroke, or other major cardiovascular event and nearly 50 percent more likely to die from any cause. Given the financial Armageddon unleashed by lockdown we should note that the study found a relationship between increased cardiovascular risk and lack of financial support. After excluding other factors social isolation was still connected to a 44 percent increased risk of cardiovascular problems and a 47 percent increased risk of death by any cause. Lack of financial support was associated with a 30 percent increase in the risk of cardiovascular health events. Dr Gronewold said it had been known for some time that feeling lonely or lacking contact with close friends and family can have an impact on physical health and the study had shown that having strong social relationships is of high importance for heart health. Gronewold said they didn't understand yet why people who are socially isolated have such poor health outcomes, but this was obviously a worrying finding, particularly during these times of prolonged social distancing. Well, it can be explained on many levels. You only have to identify the point in the body where people feel loneliness and missing people they are parted from – it's in the centre of the chest where they feel the ache of loneliness and the ache of missing people. 'My heart aches for

you' … 'My heart aches for some company.' I will explain this more in the chapter Escaping Wetiko, but when you realise that the body is the mind – they are expressions of each other – the reason why state of the mind dictates state of the body becomes clear.

American psychologist Ranjit Powar was highlighting the effects of lockdown isolation as early as April, 2020. She said humans have evolved to be social creatures and are wired to live in interactive groups. Being isolated from family, friends and colleagues could be unbalancing and traumatic for most people and could result in short or even long-term psychological and physical health problems. An increase in levels of anxiety, aggression, depression, forgetfulness and hallucinations were possible psychological effects of isolation. 'Mental conditions may be precipitated for those with underlying pre-existing susceptibilities and show up in many others without any pre-condition.' Powar said personal relationships helped us cope with stress and if we lost this outlet for letting off steam the result can be a big emotional void which, for an average person, was difficult to deal with. 'Just a few days of isolation can cause increased levels of anxiety and depression' – so what the hell has been the effect on the global population of *18 months* of this at the time of writing? Powar said: 'Add to it the looming threat of a dreadful disease being repeatedly hammered in through the media and you have a recipe for many shades of mental and physical distress.' For those with a house and a garden it is easy to forget that billions have had to endure lockdown isolation in tiny overcrowded flats and apartments with nowhere to go outside. The psychological and physical consequences of this are unimaginable and with lunatic and abusive partners and parents the consequences have led to tremendous increases in domestic and child abuse and alcoholism as people seek to shut out the horror. Ranjit Powar said:

Staying in a confined space with family is not all a rosy picture for everyone. It can be extremely oppressive and claustrophobic for large low-income families huddled together in small single-room houses. Children here are not lucky enough to have many board/electronic games or books to keep them occupied.

Add to it the deep insecurity of running out of funds for food and basic necessities. On the other hand, there are people with dysfunctional family dynamics, such as domineering, abusive or alcoholic partners, siblings or parents which makes staying home a period of trial. Incidence of suicide and physical abuse against women has shown a worldwide increase. Heightened anxiety and depression also affect a person's immune system, making them more susceptible to illness.

To think that Powar's article was published on April 11th, 2020.

Six-feet fantasy

Social (unsocial) distancing demanded that people stay six feet or two metres apart. UK government advisor Robert Dingwall from the New and Emerging Respiratory Virus Threats Advisory Group said in a radio interview that the two-metre rule was 'conjured up out of nowhere' and was not based on science. No, it was not based on *medical* science, but it didn't come out of nowhere. The distance related to *psychological* science. Six feet/two metres was adopted in many countries and we were told by people like the criminal Anthony Fauci and his ilk that it was founded on science. Many schools could not reopen because they did not have the space for six-feet distancing. Then in March, 2021, after a year of six-feet 'science', a study published in the *Journal of Infectious Diseases* involving more than 500,000 students and almost 100,000 staff over 16 weeks revealed no significant difference in 'Covid' cases between six feet and three feet and Fauci changed his tune. Now three feet was okay. There is no difference between six feet and three *inches* when there is no 'virus' and they got away with six feet for psychological reasons for as long as they could. I hear journalists and others talk about 'unintended consequences' of lockdown. They are not *unintended* at all; they have been coldly-calculated for a specific outcome of human control and that's why super-psychopaths like Gates have called for them so vehemently. Super-psychopath psychologists have demanded them and psychopathic or clueless, spineless, politicians have gone along with them by 'following the science'. But it's not science at all. 'Science' is not what is; it's only what people can be manipulated to believe it is. The whole 'Covid' catastrophe is

founded on mind control. Three word or three statement mantras issued by the UK government are a well-known mind control technique and so we've had 'Stay home/protect the NHS/save lives', 'Stay alert/control the virus/save lives' and 'hands/face/space'. One of the most vocal proponents of extreme 'Covid' rules in the UK has been Professor Susan Michie, a member of the British Communist Party, who is not a medical professional. Michie is the director of the Centre for Behaviour Change at University College London. She is a *behavioural psychologist* and another filthy rich 'Marxist' who praised China's draconian lockdown. She was known by fellow students at Oxford University as 'Stalin's nanny' for her extreme Marxism. Michie is an influential member of the UK government's Scientific Advisory Group for Emergencies (SAGE) and behavioural manipulation groups which have dominated 'Covid' policy. She is a consultant adviser to the World Health Organization on 'Covid-19' and behaviour. Why the hell are lockdowns anything to do with her when they are claimed to be about health? Why does a behavioural psychologist from a group charged with changing the behaviour of the public want lockdown, human isolation and mandatory masks? Does that question really need an answer? Michie *absolutely* has to explain herself before a Nuremberg court when humanity takes back its world again and even more so when you see the consequences of masks that she demands are compulsory. This is a Michie classic:

> The benefits of getting primary school children to wear masks is that regardless of what little degree of transmission is occurring in those age groups it could help normalise the practice. Young children wearing masks may be more likely to get their families to accept masks.

Those words alone should carry a prison sentence when you ponder on the callous disregard for children involved and what a statement it makes about the mind and motivations of Susan Michie. What a lovely lady and what she said there encapsulates the mentality of the psychopaths behind the 'Covid' horror. Let us compare what Michie said with a countrywide study in Germany published at researchsquare.com involving 25,000 school children and 17,854 health complaints submitted by parents. Researchers

found that masks are harming children physically, psychologically, and behaviourally with 24 health issues associated with mask wearing. They include: shortness of breath (29.7%); dizziness (26.4%); increased headaches (53%); difficulty concentrating (50%); drowsiness or fatigue (37%); and malaise (42%). Nearly a third of children experienced more sleep issues than before and a quarter developed new fears. Researchers found health issues and other impairments in 68 percent of masked children covering their faces for an average of 4.5 hours a day. Hundreds of those taking part experienced accelerated respiration, tightness in the chest, weakness, and short-term impairment of consciousness. A reminder of what Michie said again:

The benefits of getting primary school children to wear masks is that regardless of what little degree of transmission is occurring in those age groups it could help normalise the practice. Young children wearing masks may be more likely to get their families to accept masks.

Psychopaths in government and psychology now have children and young people – plus all the adults – wearing masks for hours on end while clueless teachers impose the will of the psychopaths on the young they should be protecting. What the hell are parents doing?

Cult lab rats

We have some schools already imposing on students microchipped buzzers that activate when they get 'too close' to their pals in the way they do with lab rats. How apt. To the Cult and its brain-dead servants our children *are* lab rats being conditioned to be unquestioning, dehumanised slaves for the rest of their lives. Children and young people are being weaned and frightened away from the most natural human instincts including closeness and touch. I have tracked in the books over the years how schools were banning pupils from greeting each other with a hug and the whole Cult-induced Me Too movement has terrified men and boys from a relaxed and natural interaction with female friends and work colleagues to the point where many men try never to be in a room

alone with a woman that's not their partner. Airhead celebrities have as always played their virtue-signalling part in making this happen with their gross exaggeration. For every monster like Harvey Weinstein there are at least tens of thousands of men that don't treat women like that; but everyone must be branded the same and policy changed for them as well as the monster. I am going to be using the word 'dehumanise' many times in this chapter because that is what the Cult is seeking to do and it goes very deep as we shall see. Don't let them kid you that social distancing is planned to end one day. That's not the idea. We are seeing more governments and companies funding and producing wearable gadgets to keep people apart and they would not be doing that if this was meant to be short-term. A tech start-up company backed by GCHQ, the British Intelligence and military surveillance headquarters, has created a social distancing wrist sensor that alerts people when they get too close to others. The CIA has also supported tech companies developing similar devices. The wearable sensor was developed by Tended, one of a number of start-up companies supported by GCHQ (see the CIA and DARPA). The device can be worn on the wrist or as a tag on the waistband and will vibrate whenever someone wearing the device breaches social distancing and gets anywhere near natural human contact. The company had a lucky break in that it was developing a distancing sensor when the 'Covid' hoax arrived which immediately provided a potentially enormous market. How fortunate. The government in big-time Cult-controlled Ontario in Canada is investing $2.5 million in wearable contact tracing technology that 'will alert users if they may have been exposed to the Covid-19 in the workplace and will beep or vibrate if they are within six feet of another person'. Facedrive Inc., the technology company behind this, was founded in 2016 with funding from the Ontario Together Fund and obviously they, too, had a prophet on the board of directors. The human surveillance and control technology is called TraceSCAN and would be worn by the human cyborgs in places such as airports, workplaces, construction sites, care homes and … *schools*.

I emphasise schools with children and young people the prime targets. You know what is planned for society as a whole if you keep your eyes on the schools. They have always been places where the state program the next generation of slaves to be its compliant worker-ants – or Woker-ants these days; but in the mist of the 'Covid' madness they have been transformed into mind laboratories on a scale never seen before. Teachers and head teachers are just as programmed as the kids – often more so. Children are kept apart from human interaction by walk lanes, classroom distancing, staggered meal times, masks, and the rolling-out of buzzer systems. Schools are now physically laid out as a laboratory maze for lab-rats. Lunatics at a school in Anchorage, Alaska, who should be prosecuted for child abuse, took away desks and forced children to kneel (know your place) on a mat for five hours a day while wearing a mask and using their chairs as a desk. How this was supposed to impact on a 'virus' only these clinically insane people can tell you and even then it would be clap-trap. The school banned recess (interaction), art classes (creativity), and physical exercise (getting body and mind moving out of inertia). Everyone behind this outrage should be in jail or better still a mental institution. The behavioural manipulators are all for this dystopian approach to schools. Professor Susan Michie, the mind-doctor and British Communist Party member, said it was wrong to say that schools were safe. They had to be made so by 'distancing', masks and ventilation (sitting all day in the cold). I must ask this lady round for dinner on a night I know I am going to be out and not back for weeks. She probably wouldn't be able to make it, anyway, with all the visits to her own psychologist she must have block-booked.

Masking identity

I know how shocking it must be for you that a behaviour manipulator like Michie wants everyone to wear masks which have long been a feature of mind-control programs like the infamous MKUltra in the United States, but, there we are. We live and learn. I spent many years from 1996 to right across the millennium

researching mind control in detail on both sides of the Atlantic and elsewhere. I met a large number of mind-control survivors and many had been held captive in body and mind by MKUltra. MK stands for mind-control, but employs the German spelling in deference to the Nazis spirited out of Germany at the end of World War Two by Operation Paperclip in which the US authorities, with help from the Vatican, transported Nazi mind-controllers and engineers to America to continue their work. Many of them were behind the creation of NASA and they included Nazi scientist and SS officer Wernher von Braun who swapped designing V-2 rockets to bombard London with designing the Saturn V rockets that powered the NASA moon programme's Apollo craft. I think I may have mentioned that the Cult has no borders. Among Paperclip escapees was Josef Mengele, the Angel of Death in the Nazi concentration camps where he conducted mind and genetic experiments on children often using twins to provide a control twin to measure the impact of his 'work' on the other. If you want to observe the Cult mentality in all its extremes of evil then look into the life of Mengele. I have met many people who suffered mercilessly under Mengele in the United States where he operated under the name Dr Greene and became a stalwart of MKUltra programming and torture. Among his locations was the underground facility in the Mojave Desert in California called the China Lake Naval Weapons Station which is almost entirely below the surface. My books *The Biggest Secret*, *Children of the Matrix* and *The Perception Deception* have the detailed background to MKUltra.

The best-known MKUltra survivor is American Cathy O'Brien. I first met her and her late partner Mark Phillips at a conference in Colorado in 1996. Mark helped her escape and deprogram from decades of captivity in an offshoot of MKUltra known as Project Monarch in which 'sex slaves' were provided for the rich and famous including Father George Bush, Dick Cheney and the Clintons. Read Cathy and Mark's book *Trance-Formation of America* and if you are new to this you will be shocked to the core. I read it in 1996 shortly before, with the usual synchronicity of my life, I found

myself given a book table at the conference right next to hers. MKUltra never ended despite being very publicly exposed (only a small part of it) in the 1970s and continues in other guises. I am still in touch with Cathy. She contacted me during 2020 after masks became compulsory in many countries to tell me how they were used as part of MKUltra programming. I had been observing 'Covid regulations' and the relationship between authority and public for months. I saw techniques that I knew were employed on individuals in MKUltra being used on the global population. I had read many books and manuals on mind control including one called *Silent Weapons for Quiet Wars* which came to light in the 1980s and was a guide on how to perceptually program on a mass scale. 'Silent Weapons' refers to mind-control. I remembered a line from the manual as governments, medical authorities and law enforcement agencies have so obviously talked to – or rather at – the adult population since the 'Covid' hoax began as if they are children. The document said:

> If a person is spoken to by a T.V. advertiser as if he were a twelve-year-old, then, due to suggestibility, he will, with a certain probability, respond or react to that suggestion with the uncritical response of a twelve-year-old and will reach in to his economic reservoir and deliver its energy to buy that product on impulse when he passes it in the store.

That's why authority has spoken to adults like children since all this began.

Why did Michael Jackson wear masks?

Every aspect of the 'Covid' narrative has mind-control as its central theme. Cathy O'Brien wrote an article for davidicke.com about the connection between masks and mind control. Her daughter Kelly who I first met in the 1990s was born while Cathy was still held captive in MKUltra. Kelly was forced to wear a mask as part of her programming from the age of *two* to dehumanise her, target her sense of individuality and reduce the amount of oxygen her brain and body received. *Bingo*. This is the real reason for compulsory

masks, why they have been enforced en masse, and why they seek to increase the number they demand you wear. First one, then two, with one disgraceful alleged 'doctor' recommending four which is nothing less than a death sentence. Where and how often they must be worn is being expanded for the purpose of mass mind control and damaging respiratory health which they can call 'Covid-19'. Canada's government headed by the man-child Justin Trudeau, says it's fine for children of two and older to wear masks. An insane 'study' in Italy involving just 47 children concluded there was no problem for babies as young as *four months* wearing them. Even after people were 'vaccinated' they were still told to wear masks by the criminal that is Anthony Fauci. Cathy wrote that mandating masks is allowing the authorities literally to control the air we breathe which is what was done in MKUltra. You might recall how the singer Michael Jackson wore masks and there is a reason for that. He was subjected to MKUltra mind control through Project Monarch and his psyche was scrambled by these simpletons. Cathy wrote:

In MKUltra Project Monarch mind control, Michael Jackson had to wear a mask to silence his voice so he could not reach out for help. Remember how he developed that whisper voice when he wasn't singing? Masks control the mind from the outside in, like the redefining of words is doing. By controlling what we can and cannot say for fear of being labeled racist or beaten, for example, it ultimately controls thought that drives our words and ultimately actions (or lack thereof).

Likewise, a mask muffles our speech so that we are not heard, which controls voice … words … mind. This is Mind Control. Masks are an obvious mind control device, and I am disturbed so many people are complying on a global scale. Masks depersonalize while making a person feel as though they have no voice. It is a barrier to others. People who would never choose to comply but are forced to wear a mask in order to keep their job, and ultimately their family fed, are compromised. They often feel shame and are subdued. People have stopped talking with each other while media controls the narrative.

The 'no voice' theme has often become literal with train passengers told not to speak to each other in case they pass on the 'virus', singing banned for the same reason and bonkers California officials telling people riding roller coasters that they cannot shout and scream. Cathy said she heard every day from healed MKUltra survivors who cannot wear a mask without flashing back on ways

their breathing was controlled – 'from ball gags and penises to water boarding'. She said that through the years when she saw images of people in China wearing masks 'due to pollution' that it was really to control their oxygen levels. 'I knew it was as much of a population control mechanism of depersonalisation as are burkas', she said. Masks are another Chinese communist/fascist method of control that has been swept across the West as the West becomes China at lightning speed since we entered 2020.

Mask-19

There are other reasons for mandatory masks and these include destroying respiratory health to call it 'Covid-19' and stunting brain development of children and the young. Dr Margarite Griesz-Brisson MD, PhD, is a Consultant Neurologist and Neurophysiologist and the Founder and Medical Director of the London Neurology and Pain Clinic. Her CV goes down the street and round the corner. She is clearly someone who cares about people and won't parrot the propaganda. Griesz-Brisson has a PhD in pharmacology, with special interest in neurotoxicology, environmental medicine, neuroregeneration and neuroplasticity (the way the brain can change in the light of information received). She went public in October, 2020, with a passionate warning about the effects of mask-wearing laws:

> The reinhalation of our exhaled air will without a doubt create oxygen deficiency and a flooding of carbon dioxide. We know that the human brain is very sensitive to oxygen deprivation. There are nerve cells for example in the hippocampus that can't be longer than 3 minutes without oxygen – they cannot survive. The acute warning symptoms are headaches, drowsiness, dizziness, issues in concentration, slowing down of reaction time – reactions of the cognitive system.

Oh, I know, let's tell bus, truck and taxi drivers to wear them and people working machinery. How about pilots, doctors and police? Griesz-Brisson makes the important point that while the symptoms she mentions may fade as the body readjusts this does not alter the fact that people continue to operate in oxygen deficit with long list of

potential consequences. She said it was well known that neurodegenerative diseases take years or decades to develop. 'If today you forget your phone number, the breakdown in your brain would have already started 20 or 30 years ago.' She said degenerative processes in your brain are getting amplified as your oxygen deprivation continues through wearing a mask. Nerve cells in the brain are unable to divide themselves normally in these circumstances and lost nerve cells will no longer be regenerated. 'What is gone is gone.' Now consider that people like shop workers and *schoolchildren* are wearing masks for hours every day. What in the name of sanity is going to be happening to them? 'I do not wear a mask, I need my brain to think', Griesz-Brisson said, 'I want to have a clear head when I deal with my patients and not be in a carbon dioxide-induced anaesthesia'. If you are told to wear a mask anywhere ask the organisation, police, store, whatever, for their risk assessment on the dangers and negative effects on mind and body of enforcing mask-wearing. They won't have one because it has never been done not even by government. All of them must be subject to class-action lawsuits as the consequences come to light. They don't do mask risk assessments for an obvious reason. They know what the conclusions would be and independent scientific studies that *have* been done tell a horror story of consequences.

'Masks are criminal'

Dr Griesz-Brisson said that for children and adolescents, masks are an absolute no-no. They had an extremely active and adaptive immune system and their brain was incredibly active with so much to learn. 'The child's brain, or the youth's brain, is thirsting for oxygen.' The more metabolically active an organ was, the more oxygen it required; and in children and adolescents every organ was metabolically active. Griesz-Brisson said that to deprive a child's or adolescent's brain of oxygen, or to restrict it in any way, was not only dangerous to their health, it was absolutely criminal. 'Oxygen deficiency inhibits the development of the brain, and the damage that has taken place as a result CANNOT be reversed.' Mind

manipulators of MKUltra put masks on two-year-olds they wanted to neurologically rewire and you can see why. Griesz-Brisson said a child needs the brain to learn and the brain needs oxygen to function. 'We don't need a clinical study for that. This is simple, indisputable physiology.' Consciously and purposely induced oxygen deficiency was an absolutely deliberate health hazard, and an absolute medical contraindication which means that 'this drug, this therapy, this method or measure should not be used, and is not allowed to be used'. To coerce an entire population to use an absolute medical contraindication by force, she said, there had to be definite and serious reasons and the reasons must be presented to competent interdisciplinary and independent bodies to be verified and authorised. She had this warning of the consequences that were coming if mask wearing continued:

When, in ten years, dementia is going to increase exponentially, and the younger generations couldn't reach their god-given potential, it won't help to say 'we didn't need the masks'. I know how damaging oxygen deprivation is for the brain, cardiologists know how damaging it is for the heart, pulmonologists know how damaging it is for the lungs. Oxygen deprivation damages every single organ. Where are our health departments, our health insurance, our medical associations? It would have been their duty to be vehemently against the lockdown and to stop it and stop it from the very beginning.

Why do the medical boards issue punishments to doctors who give people exemptions? Does the person or the doctor seriously have to prove that oxygen deprivation harms people? What kind of medicine are our doctors and medical associations representing? Who is responsible for this crime? The ones who want to enforce it? The ones who let it happen and play along, or the ones who don't prevent it?

All of the organisations and people she mentions there either answer directly to the Cult or do whatever hierarchical levels above them tell them to do. The outcome of both is the same. 'It's not about masks, it's not about viruses, it's certainly not about your health', Griesz-Brisson said. 'It is about much, much more. I am not participating. I am not afraid.' They were taking our air to breathe and there was no unfounded medical exemption from face masks. Oxygen deprivation was dangerous for every single brain. It had to be the free decision of every human being whether they want to

wear a mask that was absolutely ineffective to protect themselves from a virus. She ended by rightly identifying where the responsibility lies for all this:

> The imperative of the hour is personal responsibility. We are responsible for what we think, not the media. We are responsible for what we do, not our superiors. We are responsible for our health, not the World Health Organization. And we are responsible for what happens in our country, not the government.

Halle-bloody-lujah.

But surgeons wear masks, right?

Independent studies of mask-wearing have produced a long list of reports detailing mental, emotional and physical dangers. What a definition of insanity to see police officers imposing mask-wearing on the public which will cumulatively damage their health while the police themselves wear masks that will cumulatively damage *their* health. It's utter madness and both public and police do this because 'the government says so' – yes a government of brain-donor idiots like UK Health Secretary Matt Hancock reading the 'follow the science' scripts of psychopathic, lunatic psychologists. The response you get from Stockholm syndrome sufferers defending the very authorities that are destroying them and their families is that 'surgeons wear masks'. This is considered the game, set and match that they must work and don't cause oxygen deficit. Well, actually, scientific studies have shown that they *do* and oxygen levels are monitored in operating theatres to compensate. Surgeons wear masks to stop spittle and such like dropping into open wounds – not to stop 'viral particles' which are so miniscule they can only be seen through an electron microscope. Holes in the masks are significantly bigger than 'viral particles' and if you sneeze or cough they will breach the mask. I watched an incredibly disingenuous 'experiment' that claimed to prove that masks work in catching 'virus' material from the mouth and nose. They did this with a slow motion camera and the mask did block big stuff which stayed inside the mask and

against the face to be breathed in or cause infections on the face as we have seen with many children. 'Viral particles', however, would never have been picked up by the camera as they came through the mask when they are far too small to be seen. The 'experiment' was therefore disingenuous *and* useless.

Studies have concluded that wearing masks in operating theatres (and thus elsewhere) make no difference to preventing infection while the opposite is true with toxic shite building up in the mask and this had led to an explosion in tooth decay and gum disease dubbed by dentists 'mask mouth'. You might have seen the Internet video of a furious American doctor urging people to take off their masks after a four-year-old patient had been rushed to hospital the night before and nearly died with a lung infection that doctors sourced to mask wearing. A study in the journal *Cancer Discovery* found that inhalation of harmful microbes can contribute to advanced stage lung cancer in adults and long-term use of masks can help breed dangerous pathogens. Microbiologists have said frequent mask wearing creates a moist environment in which microbes can grow and proliferate before entering the lungs. The Canadian Agency for Drugs and Technologies in Health, or CADTH, a Canadian national organisation that provides research and analysis to healthcare decision-makers, said this as long ago as 2013 in a report entitled 'Use of Surgical Masks in the Operating Room: A Review of the Clinical Effectiveness and Guidelines'. It said:

- No evidence was found to support the use of surgical face masks to reduce the frequency of surgical site infections
- No evidence was found on the effectiveness of wearing surgical face masks to protect staff from infectious material in the operating room.
- Guidelines recommend the use of surgical face masks by staff in the operating room to protect both operating room staff and patients (despite the lack of evidence).

We were told that the world could go back to 'normal' with the arrival of the 'vaccines'. When they came, fraudulent as they are, the story changed as I knew that it would. We are in the midst of transforming 'normal', not going back to it. Mary Ramsay, head of immunisation at Public Health England, echoed the words of US criminal Anthony Fauci who said masks and other regulations must stay no matter if people are vaccinated. The Fauci idiot continued to wear two masks – different colours so both could be clearly seen – after he *claimed* to have been vaccinated. Senator Rand Paul told Fauci in one exchange that his double-masks were 'theatre' and he was right. It's all theatre. Mary Ramsay back-tracked on the vaccine-return-to-normal theme when she said the public may need to wear masks and social-distance for years despite the jabs. 'People have got used to those lower-level restrictions now, and [they] can live with them', she said telling us what the idea has been all along. 'The vaccine does not give you a pass, even if you have had it, you must continue to follow all the guidelines' said a Public Health England statement which reneged on what we had been told before and made having the 'vaccine' irrelevant to 'normality' even by the official story. Spain's fascist government trumped everyone by passing a law mandating the wearing of masks on the beach and even when swimming in the sea. The move would have devastated what's left of the Spanish tourist industry, posed potential breathing dangers to swimmers and had Northern European sunbathers walking around with their forehead brown and the rest of their face white as a sheet. The ruling was so crazy that it had to be retracted after pressure from public and tourist industry, but it confirmed where the Cult wants to go with masks and how clinically insane authority has become. The determination to make masks permanent and hide the serious dangers to body and mind can be seen in the censorship of scientist Professor Denis Rancourt by Bill Gates-funded academic publishing website ResearchGate over his papers exposing the dangers and uselessness of masks. Rancourt said:

ResearchGate today has permanently locked my account, which I have had since 2015. Their reasons graphically show the nature of their attack against democracy, and their corruption of

science … By their obscene non-logic, a scientific review of science articles reporting on harms caused by face masks has a 'potential to cause harm'. No criticism of the psychological device (face masks) is tolerated, if the said criticism shows potential to influence public policy.

This is what happens in a fascist world.

Where are the 'greens' (again)?

Other dangers of wearing masks especially regularly relate to the inhalation of minute plastic fibres into the lungs and the deluge of discarded masks in the environment and oceans. Estimates predicted that more than 1.5 billion disposable masks will end up in the world's oceans every year polluting the water with tons of plastic and endangering marine wildlife. Studies project that humans are using 129 billion face masks each month worldwide – about three million a minute. Most are disposable and made from plastic, non-biodegradable microfibers that break down into smaller plastic particles that become widespread in ecosystems. They are littering cities, clogging sewage channels and turning up in bodies of water. I have written in other books about the immense amounts of microplastics from endless sources now being absorbed into the body. Rolf Halden, director of the Arizona State University (ASU) Biodesign Center for Environmental Health Engineering, was the senior researcher in a 2020 study that analysed 47 human tissue samples and found microplastics in all of them. 'We have detected these chemicals of plastics in every single organ that we have investigated', he said. I wrote in *The Answer* about the world being deluged with microplastics. A study by the Worldwide Fund for Nature (WWF) found that people are consuming on average every week some 2,000 tiny pieces of plastic mostly through water and also through marine life and the air. Every year humans are ingesting enough microplastics to fill a heaped dinner plate and in a life-time of 79 years it is enough to fill two large waste bins. Marco Lambertini, WWF International director general said: 'Not only are plastics polluting our oceans and waterways and killing marine life – it's in all of us and we can't escape consuming plastics,' American

geologists found tiny plastic fibres, beads and shards in rainwater samples collected from the remote slopes of the Rocky Mountain National Park near Denver, Colorado. Their report was headed: 'It is raining plastic.' Rachel Adams, senior lecturer in Biomedical Science at Cardiff Metropolitan University, said that among health consequences are internal inflammation and immune responses to a 'foreign body'. She further pointed out that microplastics become carriers of toxins including mercury, pesticides and dioxins (a known cause of cancer and reproductive and developmental problems). These toxins accumulate in the fatty tissues once they enter the body through microplastics. Now this is being compounded massively by people putting plastic on their face and throwing it away.

Workers exposed to polypropylene plastic fibres known as 'flock' have developed 'flock worker's lung' from inhaling small pieces of the flock fibres which can damage lung tissue, reduce breathing capacity and exacerbate other respiratory problems. *Now* … commonly used surgical masks have three layers of melt-blown textiles made of … polypropylene. We have billions of people putting these microplastics against their mouth, nose and face for hours at a time day after day in the form of masks. How does anyone think that will work out? I mean – what could possibly go wrong? We posted a number of scientific studies on this at davidicke.com, but when I went back to them as I was writing this book the links to the science research website where they were hosted were dead. Anything that challenges the official narrative in any way is either censored or vilified. The official narrative is so unsupportable by the evidence that only deleting the truth can protect it. A study by Chinese scientists still survived – with the usual twist which it why it was still active, I guess. Yes, they found that virtually all the masks they tested increased the daily intake of microplastic fibres, but people should still wear them because the danger from the 'virus' was worse said the crazy 'team' from the Institute of Hydrobiology in Wuhan. Scientists first discovered microplastics in lung tissue of some patients who died of lung cancer

in the 1990s. Subsequent studies have confirmed the potential health damage with the plastic degrading slowly and remaining in the lungs to accumulate in volume. Wuhan researchers used a machine simulating human breathing to establish that masks shed up to nearly 4,000 microplastic fibres in a month with reused masks producing more. Scientists said some masks are laced with toxic chemicals and a variety of compounds seriously restricted for both health and environmental reasons. They include cobalt (used in blue dye) and formaldehyde known to cause watery eyes, burning sensations in the eyes, nose, and throat, plus coughing, wheezing and nausea. No – that must be 'Covid-19'.

Mask 'worms'

There is another and potentially even more sinister content of masks. Mostly new masks of different makes filmed under a microscope around the world have been found to contain strange black fibres or 'worms' that appear to move or 'crawl' by themselves and react to heat and water. The nearest I have seen to them are the self-replicating fibres that are pulled out through the skin of those suffering from Morgellons disease which has been connected to the phenomena of 'chemtrails' which I will bring into the story later on. Morgellons fibres continue to grow outside the body and have a form of artificial intelligence. Black 'worm' fibres in masks have that kind of feel to them and there is a nanotechnology technique called 'worm micelles' which carry and release drugs or anything else you want to deliver to the body. For sure the suppression of humanity by mind altering drugs is the Cult agenda big time and the more excuses they can find to gain access to the body the more opportunities there are to make that happen whether through 'vaccines' or masks pushed against the mouth and nose for hours on end.

So let us summarise the pros and cons of masks:

Against masks: Breathing in your own carbon dioxide; depriving the body and brain of sufficient oxygen; build-up of toxins in the mask that can be breathed into the lungs and cause rashes on the face and 'mask-mouth'; breathing microplastic fibres and toxic chemicals into the lungs; dehumanisation and deleting individualisation by literally making people faceless; destroying human emotional interaction through facial expression and deleting parental connection with their babies which look for guidance to their facial expression.

For masks: They don't protect you from a 'virus' that doesn't exist and even if it did 'viral' particles are so minute they are smaller than the holes in the mask.

Governments, police, supermarkets, businesses, transport companies, and all the rest who seek to impose masks have done no risk assessment on their consequences for health and psychology and are now open to group lawsuits when the impact becomes clear with a cumulative epidemic of respiratory and other disease. Authorities will try to exploit these effects and hide the real cause by dubbing them 'Covid-19'. Can you imagine setting out to force the population to wear health-destroying masks without doing any assessment of the risks? It is criminal and it is evil, but then how many people targeted in this way, who see their children told to wear them all day at school, have asked for a risk assessment? Billions can't be imposed upon by the few unless the billions allow it. Oh, yes, with just a tinge of irony, 85 percent of all masks made worldwide come from *China*.

Wash your hands in toxic shite

'Covid' rules include the use of toxic sanitisers and again the health consequences of constantly applying toxins to be absorbed through the skin is obvious to any level of Renegade Mind. America's Food and Drug Administration (FDA) said that sanitisers are drugs and issued a warning about 75 dangerous brands which contain

methanol used in antifreeze and can cause death, kidney damage and blindness. The FDA circulated the following warning even for those brands that it claims to be safe:

Store hand sanitizer out of the reach of pets and children, and children should use it only with adult supervision. Do not drink hand sanitizer. This is particularly important for young children, especially toddlers, who may be attracted by the pleasant smell or brightly colored bottles of hand sanitizer.

Drinking even a small amount of hand sanitizer can cause alcohol poisoning in children. (However, there is no need to be concerned if your children eat with or lick their hands after using hand sanitizer.) During this coronavirus pandemic, poison control centers have had an increase in calls about accidental ingestion of hand sanitizer, so it is important that adults monitor young children's use.

Do not allow pets to swallow hand sanitizer. If you think your pet has eaten something potentially dangerous, call your veterinarian or a pet poison control center right away. Hand sanitizer is flammable and should be stored away from heat and flames. When using hand sanitizer, rub your hands until they feel completely dry before performing activities that may involve heat, sparks, static electricity, or open flames.

There you go, perfectly safe, then, and that's without even a mention of the toxins absorbed through the skin. Come on kids – sanitise your hands everywhere you go. It will save you from the 'virus'. Put all these elements together of the 'Covid' normal and see how much health and psychology is being cumulatively damaged, even devastated, to 'protect your health'. Makes sense, right? They are only imposing these things because they care, right? *Right?*

Submitting to insanity

Psychological reframing of the population goes very deep and is done in many less obvious ways. I hear people say how contradictory and crazy 'Covid' rules are and how they are ever changing. This is explained away by dismissing those involved as idiots. It is a big mistake. The Cult is delighted if its cold calculation is perceived as incompetence and idiocy when it is anything but. Oh, yes, there are idiots within the system – lots of them – but they are *administering* the Cult agenda, mostly unknowingly. They are not deciding and dictating it. The bulwark against tyranny is self-

respect, always has been, always will be. It is self-respect that has broken every tyranny in history. By its very nature self-respect will not bow to oppression and its perpetrators. There is so little self-respect that it's always the few that overturn dictators. Many may eventually follow, but the few with the iron spines (self-respect) kick it off and generate the momentum. The Cult targets self-respect in the knowledge that once this has gone only submission remains. Crazy, contradictory, ever-changing 'Covid' rules are systematically applied by psychologists to delete self-respect. They *want* you to see that the rules make no sense. It is one thing to decide to do something when *you* have made the choice based on evidence and logic. You still retain your self-respect. It is quite another when you can see what you are being told to do is insane, ridiculous and makes no sense, and *yet you still do it*. Your self-respect is extinguished and this has been happening as ever more obviously stupid and nonsensical things have been demanded and the great majority have complied even when they can see they are stupid and nonsensical.

People walk around in face-nappies knowing they are damaging their health and make no difference to a 'virus'. They do it in fear of not doing it. I know it's daft, but I'll do it anyway. When that happens something dies inside of you and submissive reframing has begun. Next there's a need to hide from yourself that you have conceded your self-respect and you convince yourself that you have not really submitted to fear and intimidation. You begin to believe that you are complying with craziness because it's the right thing to do. When first you concede your self-respect of 2+2 = 4 to 2+2 = 5 you *know* you are compromising your self-respect. Gradually to avoid facing that fact you begin to *believe* that 2+2=5. You have been reframed and I have been watching this process happening in the human psyche on an industrial scale. The Cult is working to break your spirit and one of its major tools in that war is humiliation. I read how former American soldier Bradley Manning (later Chelsea Manning after a sex-change) was treated after being jailed for supplying WikiLeaks with documents exposing the enormity of

government and elite mendacity. Manning was isolated in solitary confinement for eight months, put under 24-hour surveillance, forced to hand over clothing before going to bed, and stand naked for every roll call. This is systematic humiliation. The introduction of anal swab 'Covid' tests in China has been done for the same reason to delete self-respect and induce compliant submission. Anal swabs are mandatory for incoming passengers in parts of China and American diplomats have said they were forced to undergo the indignity which would have been calculated humiliation by the Cult-owned Chinese government that has America in its sights.

Government-people: An abusive relationship

Spirit-breaking psychological techniques include giving people hope and apparent respite from tyranny only to take it away again. This happened in the UK during Christmas, 2020, when the psycho-psychologists and their political lackeys announced an easing of restrictions over the holiday only to reimpose them almost immediately on the basis of yet another lie. There is a big psychological difference between getting used to oppression and being given hope of relief only to have that dashed. Psychologists know this and we have seen the technique used repeatedly. Then there is traumatising people before you introduce more extreme regulations that require compliance. A perfect case was the announcement by the dark and sinister Whitty and Vallance in the UK that 'new data' predicted that 4,000 could die every day over the winter of 2020/2021 if we did not lockdown again. I think they call it lying and after traumatising people with that claim out came Jackboot Johnson the next day with new curbs on human freedom. Psychologists know that a frightened and traumatised mind becomes suggestable to submission and behaviour reframing. Underpinning all this has been to make people fearful and suspicious of each other and see themselves as a potential danger to others. In league with deleted self-respect you have the perfect psychological recipe for self-loathing. The relationship between authority and public is now demonstrably the same as that of

subservience to an abusive partner. These are signs of an abusive relationship explained by psychologist Leslie Becker-Phelps:

Psychological and emotional abuse: Undermining a partner's self-worth with verbal attacks, name-calling, and belittling. Humiliating the partner in public, unjustly accusing them of having an affair, or interrogating them about their every behavior. Keeping partner confused or off balance by saying they were just kidding or blaming the partner for 'making' them act this way … Feigning in public that they care while turning against them in private. This leads to victims frequently feeling confused, incompetent, unworthy, hopeless, and chronically self-doubting. [Apply these techniques to how governments have treated the population since New Year, 2020, and the parallels are obvious.]

Physical abuse: The abuser might physically harm their partner in a range of ways, such as grabbing, hitting, punching, or shoving them. They might throw objects at them or harm them with a weapon. [Observe the physical harm imposed by masks, lockdown, and so on.]

Threats and intimidation: One way abusers keep their partners in line is by instilling fear. They might be verbally threatening, or give threatening looks or gestures. Abusers often make it known that they are tracking their partner's every move. They might destroy their partner's possessions, threaten to harm them, or threaten to harm their family members. Not surprisingly, victims of this abuse often feel anxiety, fear, and panic. [No words necessary.]

Isolation: Abusers often limit their partner's activities, forbidding them to talk or interact with friends or family. They might limit access to a car or even turn off their phone. All of this might be done by physically holding them against their will, but is often accomplished through psychological abuse and intimidation. The more isolated a person feels, the fewer resources they have to help gain perspective on their situation and to escape from it. [No words necessary.]

Economic abuse: Abusers often make their partners beholden to them for money by controlling access to funds of any kind. They might prevent their partner from getting a job or withhold access to money they earn from a job. This creates financial dependency that makes leaving the relationship very difficult. [See destruction of livelihoods and the proposed meagre 'guaranteed income' so long as you do whatever you are told.]

Using children: An abuser might disparage their partner's parenting skills, tell their children lies about their partner, threaten to take custody of their children, or threaten to harm their children. These tactics instil fear and often elicit compliance. [See reframed social service mafia and how children are being mercilessly abused by the state over 'Covid' while their parents look on too frightened to do anything.]

A further recurring trait in an abusive relationship is the abused blaming themselves for their abuse and making excuses for the abuser. We have the public blaming each other for lockdown abuse by government and many making excuses for the government while attacking those who challenge the government. How often we have heard authorities say that rules are being imposed or reimposed only because people have refused to 'behave' and follow the rules. We don't want to do it – it's *you*.

Renegade Minds are an antidote to all of these things. They will never concede their self-respect no matter what the circumstances. Even when apparent humiliation is heaped upon them they laugh in its face and reflect back the humiliation on the abuser where it belongs. Renegade Minds will never wear masks they know are only imposed to humiliate, suppress and damage both physically and psychologically. Consequences will take care of themselves and they will never break their spirit or cause them to concede to tyranny. UK newspaper columnist Peter Hitchens was one of the few in the mainstream media to speak out against lockdowns and forced vaccinations. He then announced he had taken the jab. He wanted to see family members abroad and he believed vaccine passports were inevitable even though they had not yet been introduced. Hitchens

has a questioning and critical mind, but not a Renegade one. If he had no amount of pressure would have made him concede. Hitchens excused his action by saying that the battle has been lost. Renegade Minds never accept defeat when freedom is at stake and even if they are the last one standing the self-respect of not submitting to tyranny is more important than any outcome or any consequence.

That's why Renegade Minds are the only minds that ever changed anything worth changing.

CHAPTER EIGHT

'Reframing' insanity

Insanity is relative. It depends on who has who locked in what cage
Ray Bradbury

'Reframing' a mind means simply to change its perception and behaviour. This can be done subconsciously to such an extent that subjects have no idea they have been 'reframed' while to any observer changes in behaviour and attitudes are obvious.

Human society is being reframed on a ginormous scale since the start of 2020 and here we have the reason why psychologists rather than doctors have been calling the shots. Ask most people who have succumbed to 'Covid' reframing if they have changed and most will say 'no'; but they *have* and fundamentally. The Cult's long-game has been preparing for these times since way back and crucial to that has been to prepare both population and officialdom mentally and emotionally. To use the mind-control parlance they had to reframe the population with a mentality that would submit to fascism and reframe those in government and law enforcement to impose fascism or at least go along with it. The result has been the fact-deleted mindlessness of 'Wokeness' and officialdom that has either enthusiastically or unquestioningly imposed global tyranny demanded by reframed politicians on behalf of psychopathic and deeply evil cultists. 'Cognitive reframing' identifies and challenges the way someone sees the world in the form of situations, experiences and emotions and then restructures those perceptions to view the same set of circumstances in a different way. This can have

benefits if the attitudes are personally destructive while on the other side it has the potential for individual and collective mind control which the subject has no idea has even happened.

Cognitive therapy was developed in the 1960s by Aaron T. Beck who was born in Rhode Island in 1921 as the son of Jewish immigrants from the Ukraine. He became interested in the techniques as a treatment for depression. Beck's daughter Judith S. Beck is prominent in the same field and they founded the Beck Institute for Cognitive Behavior Therapy in Philadelphia in 1994. Cognitive reframing, however, began to be used worldwide by those with a very dark agenda. The Cult reframes politicians to change their attitudes and actions until they are completely at odds with what they once appeared to stand for. The same has been happening to government administrators at all levels, law enforcement, military and the human population. Cultists love mind control for two main reasons: It allows them to control what people think, do and say to secure agenda advancement and, by definition, it calms their legendary insecurity and fear of the unexpected. I have studied mind control since the time I travelled America in 1996. I may have been talking to next to no one in terms of an audience in those years, but my goodness did I gather a phenomenal amount of information and knowledge about so many things including the techniques of mind control. I have described this in detail in other books going back to *The Biggest Secret* in 1998. I met a very large number of people recovering from MKUltra and its offshoots and successors and I began to see how these same techniques were being used on the population in general. This was never more obvious than since the 'Covid' hoax began.

Reframing the enforcers

I have observed over the last two decades and more the very clear transformation in the dynamic between the police, officialdom and the public. I tracked this in the books as the relationship mutated from one of serving the public to seeing them as almost the enemy and certainly a lower caste. There has always been a class divide

based on income and always been some psychopathic, corrupt, and big-I-am police officers. This was different. Wholesale change was unfolding in the collective dynamic; it was less about money and far more about position and perceived power. An us-and-them was emerging. Noses were lifted skyward by government administration and law enforcement and their attitude to the public they were *supposed* to be serving changed to one of increasing contempt, superiority and control. The transformation was so clear and widespread that it had to be planned. Collective attitudes and dynamics do not change naturally and organically that quickly on that scale. I then came across an organisation in Britain called Common Purpose created in the late 1980s by Julia Middleton who would work in the office of Deputy Prime Minister John Prescott during the long and disastrous premiership of war criminal Tony Blair. When Blair speaks the Cult is speaking and the man should have been in jail a long time ago. Common Purpose proclaims itself to be one of the biggest 'leadership development' organisations in the world while functioning as a *charity* with all the financial benefits which come from that. It hosts 'leadership development' courses and programmes all over the world and claims to have 'brought together' what it calls 'leaders' from more than 100 countries on six continents. The modus operandi of Common Purpose can be compared with the work of the UK government's reframing network that includes the Behavioural Insights Team 'nudge unit' and 'Covid' reframing specialists at SPI-B. WikiLeaks described Common Purpose long ago as 'a hidden virus in our government and schools' which is unknown to the general public: 'It recruits and trains "leaders" to be loyal to the directives of Common Purpose and the EU, instead of to their own departments, which they then undermine or subvert, the NHS [National Health Service] being an example.' This is a vital point to understand the 'Covid' hoax. The NHS, and its equivalent around the world, has been utterly reframed in terms of administrators and much of the medical personnel with the transformation underpinned by recruitment policies. The outcome has been the criminal and psychopathic behaviour of the

NHS over 'Covid' and we have seen the same in every other major country. WikiLeaks said Common Purpose trainees are 'learning to rule without regard to democracy' and to usher in a police state (current events explained). Common Purpose operated like a 'glue' and had members in the NHS, BBC, police, legal profession, church, many of Britain's 7,000 quangos, local councils, the Civil Service, government ministries and Parliament, and controlled many RDA's (Regional Development Agencies). Here we have one answer for how and why British institutions and their like in other countries have changed so negatively in relation to the public. This further explains how and why the beyond-disgraceful reframed BBC has become a propaganda arm of 'Covid' fascism. They are all part of a network pursuing the same goal.

By 2019 Common Purpose was quoting a figure of 85,000 'leaders' that had attended its programmes. These 'students' of all ages are known as Common Purpose 'graduates' and they consist of government, state and local government officials and administrators, police chiefs and officers, and a whole range of others operating within the national, local and global establishment. Cressida Dick, Commissioner of the London Metropolitan Police, is the Common Purpose graduate who was the 'Gold Commander' that oversaw what can only be described as the murder of Brazilian electrician Jean Charles de Menezes in 2005. He was held down by psychopathic police and shot seven times in the head by a psychopathic lunatic after being mistaken for a terrorist when he was just a bloke going about his day. Dick authorised officers to pursue and keep surveillance on de Menezes and ordered that he be stopped from entering the underground train system. Police psychopaths took her at her word clearly. She was 'disciplined' for this outrage by being *promoted* – eventually to the top of the 'Met' police where she has been a disaster. Many Chief Constables controlling the police in different parts of the UK are and have been Common Purpose graduates. I have heard the 'graduate' network described as a sort of Mafia or secret society operating within the fabric of government at all levels pursuing a collective policy

ingrained at Common Purpose training events. Founder Julia Middleton herself has said:

> Locally and internationally, Common Purpose graduates will be 'lighting small fires' to create change in their organisations and communities … The Common Purpose effect is best illustrated by the many stories of small changes brought about by leaders, who themselves have changed.

A Common Purpose mission statement declared:

> Common Purpose aims to improve the way society works by expanding the vision, decision-making ability and influence of all kinds of leaders. The organisation runs a variety of educational programmes for leaders of all ages, backgrounds and sectors, in order to provide them with the inspirational, information and opportunities they need to change the world.

Yes, but into what? Since 2020 the answer has become clear.

NLP and the Delphi technique

Common Purpose would seem to be a perfect name or would common programming be better? One of the foundation methods of reaching 'consensus' (group think) is by setting the agenda theme and then encouraging, cajoling or pressuring everyone to agree a 'consensus' in line with the core theme promoted by Common Purpose. The methodology involves the 'Delphi technique', or an adaption of it, in which opinions are expressed that are summarised by a 'facilitator or change agent' at each stage. Participants are 'encouraged' to modify their views in the light of what others have said. Stage by stage the former individual opinions are merged into group consensus which just happens to be what Common Purpose wants them to believe. A key part of this is to marginalise anyone refusing to concede to group think and turn the group against them to apply pressure to conform. We are seeing this very technique used on the general population to make 'Covid' group-thinkers hostile to those who have seen through the bullshit. People can be reframed by using perception manipulation methods such as Neuro-Linguistic Programming (NLP) in which you change perception with the use of

carefully constructed language. An NLP website described the technique this way:

… A method of influencing brain behaviour (the 'neuro' part of the phrase) through the use of language (the 'linguistic' part) and other types of communication to enable a person to 'recode' the way the brain responds to stimuli (that's the 'programming') and manifest new and better behaviours. Neuro-Linguistic Programming often incorporates hypnosis and self-hypnosis to help achieve the change (or 'programming') that is wanted.

British alternative media operation UKColumn has done very detailed research into Common Purpose over a long period. I quoted co-founder and former naval officer Brian Gerrish in my book *Remember Who You Are*, published in 2011, as saying the following years before current times:

It is interesting that many of the mothers who have had children taken by the State speak of the Social Services people being icily cool, emotionless and, as two ladies said in slightly different words, '… like little robots'. We know that NLP is cumulative, so people can be given small imperceptible doses of NLP in a course here, another in a few months, next year etc. In this way, major changes are accrued in their personality, but the day by day change is almost unnoticeable.

In these and other ways 'graduates' have had their perceptions uniformly reframed and they return to their roles in the institutions of government, law enforcement, legal profession, military, 'education', the UK National Health Service and the whole swathe of the establishment structure to pursue a common agenda preparing for the 'post-industrial', 'post-democratic' society. I say 'preparing' but we are now there. 'Post-industrial' is code for the Great Reset and 'post-democratic' is 'Covid' fascism. UKColumn has spoken to partners of those who have attended Common Purpose 'training'. They have described how personalities and attitudes of 'graduates' changed very noticeably for the worse by the time they had completed the course. They had been 'reframed' and told they are the 'leaders' – the special ones – who know better than the population. There has also been the very demonstrable recruitment of psychopaths and narcissists into government administration at all

levels and law enforcement. If you want psychopathy hire psychopaths and you get a simple cause and effect. If you want administrators, police officers and 'leaders' to perceive the public as lesser beings who don't matter then employ narcissists. These personalities are identified using 'psychometrics' that identifies knowledge, abilities, attitudes and personality traits, mostly through carefully-designed questionnaires and tests. As this policy has passed through the decades we have had power-crazy, power-trippers appointed into law enforcement, security and government administration in preparation for current times and the dynamic between public and law enforcement/officialdom has been transformed. UKColumn's Brian Gerrish said of the narcissistic personality:

> Their love of themselves and power automatically means that they will crush others who get in their way. I received a major piece of the puzzle when a friend pointed out that when they made public officials re-apply for their own jobs several years ago they were also required to do psychometric tests. This was undoubtedly the start of the screening process to get 'their' sort of people in post.

How obvious that has been since 2020 although it was clear what was happening long before if people paid attention to the changing public-establishment dynamic.

Change agents

At the centre of events in 'Covid' Britain is the National Health Service (NHS) which has behaved disgracefully in slavishly following the Cult agenda. The NHS management structure is awash with Common Purpose graduates or 'change agents' working to a common cause. Helen Bevan, a Chief of Service Transformation at the NHS Institute for Innovation and Improvement, co-authored a document called 'Towards a million change agents, a review of the social movements literature: implications for large scale change in the NHS'. The document compared a project management approach to that of change and social movements where 'people change

themselves and each other – peer to peer'. Two definitions given for a 'social movement' were:

A group of people who consciously attempt to build a radically new social order; involves people of a broad range of social backgrounds; and deploys politically confrontational and socially disruptive tactics – Cyrus Zirakzadeh 1997

Collective challenges, based on common purposes and social solidarities, in sustained interaction with elites, opponents, and authorities – Sidney Tarrow 1994

Helen Bevan wrote another NHS document in which she defined 'framing' as 'the process by which leaders construct, articulate and put across their message in a powerful and compelling way in order to win people to their cause and call them to action'. I think I could come up with another definition that would be rather more accurate. The National Health Service and institutions of Britain and the wider world have been taken over by reframed 'change agents' and that includes everything from the United Nations to national governments, local councils and social services which have been kidnapping children from loving parents on an extraordinary and gathering scale on the road to the end of parenthood altogether. Children from loving homes are stolen and kidnapped by the state and put into the 'care' (inversion) of the local authority through council homes, foster parents and forced adoption. At the same time children are allowed to be abused without response while many are under council 'care'. UKColumn highlighted the Common Purpose connection between South Yorkshire Police and Rotherham council officers in the case of the scandal in that area of the sexual exploitation of children to which the authorities turned not one blind eye, but both:

We were alarmed to discover that the Chief Executive, the Strategic Director of Children and Young People's Services, the Manager for the Local Strategic Partnership, the Community Cohesion Manager, the Cabinet Member for Cohesion, the Chief Constable and his predecessor had all attended Leadership training courses provided by the pseudo-charity Common Purpose.

Once 'change agents' have secured positions of hire and fire within any organisation things start to move very quickly. Personnel are then hired and fired on the basis of whether they will work towards the agenda the change agent represents. If they do they are rapidly promoted even though they may be incompetent. Those more qualified and skilled who are pre-Common Purpose 'old school' see their careers stall and even disappear. This has been happening for decades in every institution of state, police, 'health' and social services and all of them have been transformed as a result in their attitudes to their jobs and the public. Medical professions, including nursing, which were once vocations for the caring now employ many cold, callous and couldn't give a shit personality types. The UKColumn investigation concluded:

By blurring the boundaries between people, professions, public and private sectors, responsibility and accountability, Common Purpose encourages 'graduates' to believe that as new selected leaders, they can work together, outside of the established political and social structures, to achieve a paradigm shift or CHANGE – so called 'Leading Beyond Authority'. In doing so, the allegiance of the individual becomes 'reframed' on CP colleagues and their NETWORK.

Reframing the Face-Nappies

Nowhere has this process been more obvious than in the police where recruitment of psychopaths and development of unquestioning mind-controlled group-thinkers have transformed law enforcement into a politically-correct 'Woke' joke and a travesty of what should be public service. Today they wear their face-nappies like good little gofers and enforce 'Covid' rules which are fascism under another name. Alongside the specifically-recruited psychopaths we have software minds incapable of free thought. Brian Gerrish again:

An example is the policeman who would not get on a bike for a press photo because he had not done the cycling proficiency course. Normal people say this is political correctness gone mad. Nothing could be further from the truth. The policeman has been reframed, and in his reality it is perfect common sense not to get on the bike 'because he hasn't done the cycling course'.

Another example of this is where the police would not rescue a boy from a pond until they had taken advice from above on the 'risk assessment'. A normal person would have arrived, perhaps thought of the risk for a moment, and dived in. To the police now 'reframed', they followed 'normal' procedure.

There are shocking cases of reframed ambulance crews doing the same. Sheer unthinking stupidity of London Face-Nappies headed by Common Purpose graduate Cressida Dick can be seen in their behaviour at a vigil in March, 2021, for a murdered woman, Sarah Everard. A police officer had been charged with the crime. Anyone with a brain would have left the vigil alone in the circumstances. Instead they 'manhandled' women to stop them breaking 'Covid rules' to betray classic reframing. Minds in the thrall of perception control have no capacity for seeing a situation on its merits and acting accordingly. 'Rules is rules' is their only mind-set. My father used to say that rules and regulations are for the guidance of the intelligent and the blind obedience of the idiot. Most of the intelligent, decent, coppers have gone leaving only the other kind and a few old school for whom the job must be a daily nightmare. The combination of psychopaths and rule-book software minds has been clearly on public display in the 'Covid' era with automaton robots in uniform imposing fascistic 'Covid' regulations on the population without any personal initiative or judging situations on their merits. There are thousands of examples around the world, but I'll make my point with the infamous Derbyshire police in the English East Midlands – the ones who think pouring dye into beauty spots and using drones to track people walking in the countryside away from anyone is called 'policing'. To them there are rules decreed by the government which they have to enforce and in their bewildered state a group gathering in a closed space and someone walking alone in the countryside are the same thing. It is beyond idiocy and enters the realm of clinical insanity.

Police officers in Derbyshire said they were 'horrified' – *horrified* – to find 15 to 20 'irresponsible' kids playing a football match at a closed leisure centre 'in breach of coronavirus restrictions'. When they saw the police the kids ran away leaving their belongings behind and the reframed men and women of Derbyshire police were seeking to establish their identities with a view to fining their parents. The most natural thing for youngsters to do – kicking a ball about – is turned into a criminal activity and enforced by the moronic software programs of Derbyshire police. You find the same mentality in every country. These barely conscious 'horrified' officers said they had to take action because 'we need to ensure these rules are being followed' and 'it is of the utmost importance that you ensure your children are following the rules and regulations for Covid-19'. Had any of them done ten seconds of research to see if this parroting of their masters' script could be supported by any evidence? Nope. Reframed people don't think – others think for them and that's the whole idea of reframing. I have seen police officers one after the other repeating without question word for word what officialdom tells them just as I have seen great swathes of the public doing the same. Ask either for 'their' opinion and out spews what they have been told to think by the official narrative. Police and public may seem to be in different groups, but their mentality is the same. Most people do whatever they are told in fear not doing so or because they believe what officialdom tells them; almost the entirety of the police do what they are told for the same reason. Ultimately it's the tiny inner core of the global Cult that's telling both what to do.

So Derbyshire police were 'horrified'. Oh, really? Why did they think those kids were playing football? It was to relieve the psychological consequences of lockdown and being denied human contact with their friends and interaction, touch and discourse vital to human psychological health. Being denied this month after month has dismantled the psyche of many children and young people as depression and suicide have exploded. Were Derbyshire police *horrified by that*? Are you kidding? Reframed people don't have those

mental and emotional processes that can see how the impact on the psychological health of youngsters is far more dangerous than any 'virus' even if you take the mendacious official figures to be true. The reframed are told (programmed) how to act and so they do. The Derbyshire Chief Constable in the first period of lockdown when the black dye and drones nonsense was going on was Peter Goodman. He was the man who severed the connection between his force and the Derbyshire Constabulary *Male Voice* Choir when he decided that it was not inclusive enough to allow women to join. The fact it was a male voice choir making a particular sound produced by male voices seemed to elude a guy who terrifyingly ran policing in Derbyshire. He retired weeks after his force was condemned as disgraceful by former Supreme Court Justice Jonathan Sumption for their behaviour over extreme lockdown impositions. Goodman was replaced by his deputy Rachel Swann who was in charge when her officers were 'horrified'. The police statement over the boys committing the hanging-offence of playing football included the line about the youngsters being 'irresponsible in the times we are all living through' missing the point that the real relevance of the 'times we are all living through' is the imposition of fascism enforced by psychopaths and reframed minds of police officers playing such a vital part in establishing the fascist tyranny that their own children and grandchildren will have to live in their entire lives. As a definition of insanity that is hard to beat although it might be run close by imposing masks on people that can have a serious effect on their health while wearing a face nappy all day themselves. Once again public and police do it for the same reason – the authorities tell them to and who are they to have the self-respect to say no?

Wokers in uniform

How reframed do you have to be to arrest a *six-year-old* and take him to court for *picking a flower* while waiting for a bus? Brain dead police and officialdom did just that in North Carolina where criminal proceedings happen regularly for children under nine. Attorney Julie Boyer gave the six-year-old crayons and a colouring book

during the 'flower' hearing while the 'adults' decided his fate. County Chief District Court Judge Jay Corpening asked: 'Should a child that believes in Santa Claus, the Easter Bunny and the tooth fairy be making life-altering decisions?' Well, of course not, but common sense has no meaning when you have a common purpose and a reframed mind. Treating children in this way, and police operating in American schools, is all part of the psychological preparation for children to accept a police state as normal all their adult lives. The same goes for all the cameras and biometric tracking technology in schools. Police training is focused on reframing them as snowflake Wokers and this is happening in the military. Pentagon top brass said that 'training sessions on extremism' were needed for troops who asked why they were so focused on the Capitol Building riot when Black Lives Matter riots were ignored. What's the difference between them some apparently and rightly asked. Actually, there is a difference. Five people died in the Capitol riot, only one through violence, and that was a police officer shooting an unarmed protestor. BLM riots killed at least 25 people and cost billions. Asking the question prompted the psychopaths and reframed minds that run the Pentagon to say that more 'education' (programming) was needed. Troop training is all based on psychological programming to make them fodder for the Cult – 'Military men are just dumb, stupid animals to be used as pawns in foreign policy' as Cult-to-his-DNA former Secretary of State Henry Kissinger famously said. Governments see the police in similar terms and it's time for those among them who can see this to defend the people and stop being enforcers of the Cult agenda upon the people.

The US military, like the country itself, is being targeted for destruction through a long list of Woke impositions. Cult-owned gaga 'President' Biden signed an executive order when he took office to allow taxpayer money to pay for transgender surgery for active military personnel and veterans. Are you a man soldier? No, I'm a LGBTQIA+ with a hint of Skoliosexual and Spectrasexual. Oh, good man. Bad choice of words you bigot. The Pentagon announced in March, 2021, the appointment of the first 'diversity and inclusion

officer' for US Special Forces. Richard Torres-Estrada arrived with the publication of a 'D&I Strategic Plan which will guide the enterprise-wide effort to institutionalize and sustain D&I'. If you think a Special Forces 'Strategic Plan' should have something to do with defending America you haven't been paying attention. Defending Woke is now the military's new role. Torres-Estrada has posted images comparing Donald Trump with Adolf Hitler and we can expect no bias from him as a representative of the supposedly non-political Pentagon. Cable news host Tucker Carlson said: 'The Pentagon is now the Yale faculty lounge but with cruise missiles.' Meanwhile Secretary of Defense Lloyd Austin, a board member of weapons-maker Raytheon with stock and compensation interests in October, 2020, worth $1.4 million, said he was purging the military of the 'enemy within' – anyone who isn't Woke and supports Donald Trump. Austin refers to his targets as 'racist extremists' while in true Woke fashion being himself a racist extremist. Pentagon documents pledge to 'eradicate, eliminate and conquer all forms of racism, sexism and homophobia'. The definitions of these are decided by 'diversity and inclusion committees' peopled by those who see racism, sexism and homophobia in every situation and opinion. Woke (the Cult) is dismantling the US military and purging testosterone as China expands its military and gives its troops 'masculinity training'. How do we think that is going to end when this is all Cult coordinated? The US military, like the British military, is controlled by Woke and spineless top brass who just go along with it out of personal career interests.

'Woke' means fast asleep

Mind control and perception manipulation techniques used on individuals to create group-think have been unleashed on the global population in general. As a result many have no capacity to see the obvious fascist agenda being installed all around them or what 'Covid' is really all about. Their brains are firewalled like a computer system not to process certain concepts, thoughts and realisations that are bad for the Cult. The young are most targeted as the adults they

will be when the whole fascist global state is planned to be fully implemented. They need to be prepared for total compliance to eliminate all pushback from entire generations. The Cult has been pouring billions into taking complete control of 'education' from schools to universities via its operatives and corporations and not least Bill Gates as always. The plan has been to transform 'education' institutions into programming centres for the mentality of 'Woke'. James McConnell, professor of psychology at the University of Michigan, wrote in *Psychology Today* in 1970:

> The day has come when we can combine sensory deprivation with drugs, hypnosis, and astute manipulation of reward and punishment, to gain almost absolute control over an individual's behaviour. It should then be possible to achieve a very rapid and highly effective type of brainwashing that would allow us to make dramatic changes in a person's behaviour and personality ...
>
> … We should reshape society so that we all would be trained from birth to want to do what society wants us to do. We have the techniques to do it... no-one owns his own personality you acquired, and there's no reason to believe you should have the right to refuse to acquire a new personality if your old one is anti-social.

This was the potential for mass brainwashing in 1970 and the mentality there displayed captures the arrogant psychopathy that drives it forward. I emphasise that not all young people have succumbed to Woke programming and those that haven't are incredibly impressive people given that today's young are the most perceptually-targeted generations in history with all the technology now involved. Vast swathes of the young generations, however, have fallen into the spell – and that's what it is – of Woke. The Woke mentality and perceptual program is founded on *inversion* and you will appreciate later why that is so significant. Everything with Woke is inverted and the opposite of what it is claimed to be. Woke was a term used in African-American culture from the 1900s and referred to an awareness of social and racial justice. This is not the meaning of the modern version or 'New Woke' as I call it in *The Answer*. Oh, no, Woke today means something very different no matter how much Wokers may seek to hide that and insist Old Woke and New

Woke are the same. See if you find any 'awareness of social justice' here in the modern variety:

- Woke demands 'inclusivity' while excluding anyone with a different opinion and calls for mass censorship to silence other views.

- Woke claims to stand against oppression when imposing oppression is the foundation of all that it does. It is the driver of political correctness which is nothing more than a Cult invention to manipulate the population to silence itself.

- Woke believes itself to be 'liberal' while pursuing a global society that can only be described as fascist (see 'anti-fascist' fascist Antifa).

- Woke calls for 'social justice' while spreading injustice wherever it goes against the common 'enemy' which can be easily identified as a differing view.

- Woke is supposed to be a metaphor for 'awake' when it is solid-gold asleep and deep in a Cult-induced coma that meets the criteria for 'off with the fairies'.

I state these points as obvious facts if people only care to look. I don't do this with a sense of condemnation. We need to appreciate that the onslaught of perceptual programming on the young has been incessant and merciless. I can understand why so many have been reframed, or, given their youth, framed from the start to see the world as the Cult demands. The Cult has had access to their minds day after day in its 'education' system for their entire formative years. Perception is formed from information received and the Cult-created system is a life-long download of information delivered to elicit a particular perception, thus behaviour. The more this has expanded into still new extremes in recent decades and ever-increasing censorship has deleted other opinions and information why wouldn't that lead to a perceptual reframing on a mass scale? I

have described already cradle-to-grave programming and in more recent times the targeting of young minds from birth to adulthood has entered the stratosphere. This has taken the form of skewing what is 'taught' to fit the Cult agenda and the omnipresent techniques of group-think to isolate non-believers and pressure them into line. There has always been a tendency to follow the herd, but we really are in a new world now in relation to that. We have parents who can see the 'Covid' hoax told by their children not to stop them wearing masks at school, being 'Covid' tested or having the 'vaccine' in fear of the peer-pressure consequences of being different. What is 'peer-pressure' if not pressure to conform to group-think? Renegade Minds never group-think and always retain a set of perceptions that are unique to them. Group-think is always underpinned by consequences for not group-thinking. Abuse now aimed at those refusing DNA-manipulating 'Covid vaccines' are a potent example of this. The biggest pressure to conform comes from the very group which is itself being manipulated. 'I am programmed to be part of a hive mind and so you must be.'

Woke control structures in 'education' now apply to every mainstream organisation. Those at the top of the 'education' hierarchy (the Cult) decide the policy. This is imposed on governments through the Cult network; governments impose it on schools, colleges and universities; their leadership impose the policy on teachers and academics and they impose it on children and students. At any level where there is resistance, perhaps from a teacher or university lecturer, they are targeted by the authorities and often fired. Students themselves regularly demand the dismissal of academics (increasingly few) at odds with the narrative that the students have been programmed to believe in. It is quite a thought that students who are being targeted by the Cult become so consumed by programmed group-think that they launch protests and demand the removal of those who are trying to push back against those targeting the students. Such is the scale of perceptual inversion. We see this with 'Covid' programming as the Cult imposes the rules via psycho-psychologists and governments on

shops, transport companies and businesses which impose them on their staff who impose them on their customers who pressure Pushbackers to conform to the will of the Cult which is in the process of destroying them and their families. Scan all aspects of society and you will see the same sequence every time.

Fact free Woke and hijacking the 'left'

There is no more potent example of this than 'Woke', a mentality only made possible by the deletion of factual evidence by an 'education' system seeking to produce an ever more uniform society. Why would you bother with facts when you don't know any? Deletion of credible history both in volume and type is highly relevant. Orwell said: 'Who controls the past controls the future: who controls the present controls the past.' They who control the perception of the past control the perception of the future and they who control the present control the perception of the past through the writing and deleting of history. Why would you oppose the imposition of Marxism in the name of Wokeism when you don't know that Marxism cost at least 100 million lives in the 20th century alone? Watch videos and read reports in which Woker generations are asked basic historical questions – it's mind-blowing. A survey of 2,000 people found that six percent of millennials (born approximately early1980s to early 2000s) believed the Second World War (1939-1945) broke out with the assassination of President Kennedy (in 1963) and one in ten thought Margaret Thatcher was British Prime Minister at the time. She was in office between 1979 and 1990. We are in a post-fact society. Provable facts are no defence against the fascism of political correctness or Silicon Valley censorship. Facts don't matter anymore as we have witnessed with the 'Covid' hoax. Sacrificing uniqueness to the Woke group-think religion is all you are required to do and that means thinking for yourself is the biggest Woke no, no. All religions are an expression of group-think and censorship and Woke is just another religion with an orthodoxy defended by group-think and censorship. Burned at

the stake becomes burned on Twitter which leads back eventually to burned at the stake as Woke humanity regresses to ages past.

The biggest Woke inversion of all is its creators and funders. I grew up in a traditional left of centre political household on a council estate in Leicester in the 1950s and 60s – you know, the left that challenged the power of wealth-hoarding elites and threats to freedom of speech and opinion. In those days students went on marches defending freedom of speech while today's Wokers march for its deletion. What on earth could have happened? Those very elites (collectively the Cult) that we opposed in my youth and early life have funded into existence the antithesis of that former left and hijacked the 'brand' while inverting everything it ever stood for. We have a mentality that calls itself 'liberal' and 'progressive' while acting like fascists. Cult billionaires and their corporations have funded themselves into control of 'education' to ensure that Woke programming is unceasing throughout the formative years of children and young people and that non-Wokers are isolated (that word again) whether they be students, teachers or college professors. The Cult has funded into existence the now colossal global network of Woke organisations that have spawned and promoted all the 'causes' on the Cult wish-list for global transformation and turned Wokers into demanders of them. Does anyone really think it's a coincidence that the Cult agenda for humanity is a carbon (sorry) copy of the societal transformations desired by Woke?? These are only some of them:

Political correctness: The means by which the Cult deletes all public debates that it knows it cannot win if we had the free-flow of information and evidence.

Human-caused 'climate change': The means by which the Cult seeks to transform society into a globally-controlled dictatorship imposing its will over the fine detail of everyone's lives 'to save the planet' which doesn't actually need saving.

Transgender obsession: Preparing collective perception to accept the 'new human' which would not have genders because it would be created technologically and not through procreation. I'll have much more on this in Human 2.0.

Race obsession: The means by which the Cult seeks to divide and rule the population by triggering racial division through the perception that society is more racist than ever when the opposite is the case. Is it perfect in that regard? No. But to compare today with the racism of apartheid and segregation brought to an end by the civil rights movement in the 1960s is to insult the memory of that movement and inspirations like Martin Luther King. Why is the 'anti-racism' industry (which it is) so dominated by privileged white people?

White supremacy: This is a label used by privileged white people to demonise poor and deprived white people pushing back on tyranny to marginalise and destroy them. White people are being especially targeted as the dominant race by number within Western society which the Cult seeks to transform in its image. If you want to change a society you must weaken and undermine its biggest group and once you have done that by using the other groups you next turn on them to do the same … 'Then they came for the Jews and I was not a Jew so I did nothing.'

Mass migration: The mass movement of people from the Middle East, Africa and Asia into Europe, from the south into the United States and from Asia into Australia are another way the Cult seeks to dilute the racial, cultural and political influence of white people on Western society. White people ask why their governments appear to be working against them while being politically and culturally biased towards incoming cultures. Well, here's your answer. In the same way sexually 'straight' people, men and women, ask why the

authorities are biased against them in favour of other sexualities. The answer is the same – that's the way the Cult wants it to be for very sinister motives.

These are all central parts of the Cult agenda and central parts of the Woke agenda and Woke was created and continues to be funded to an immense degree by Cult billionaires and corporations. If anyone begins to say 'coincidence' the syllables should stick in their throat.

Billionaire 'social justice warriors'

Joe Biden is a 100 percent-owned asset of the Cult and the Wokers' man in the White House whenever he can remember his name and for however long he lasts with his rapidly diminishing cognitive function. Even walking up the steps of an aircraft without falling on his arse would appear to be a challenge. He's not an empty-shell puppet or anything. From the minute Biden took office (or the Cult did) he began his executive orders promoting the Woke wish-list. You will see the Woke agenda imposed ever more severely because it's really the *Cult* agenda. Woke organisations and activist networks spawned by the Cult are funded to the extreme so long as they promote what the Cult wants to happen. Woke is funded to promote 'social justice' by billionaires who become billionaires by destroying social justice. The social justice mantra is only a cover for dismantling social justice and funded by billionaires that couldn't give a damn about social justice. Everything makes sense when you see that. One of Woke's premier funders is Cult billionaire financier George Soros who said: 'I am basically there to make money, I cannot and do not look at the social consequences of what I do.' This is the same Soros who has given more than $32 billion to his Open Society Foundations global Woke network and funded Black Lives Matter, mass immigration into Europe and the United States, transgender activism, climate change activism, political correctness and groups targeting 'white supremacy' in the form of privileged white thugs that dominate Antifa. What a scam it all is and when

you are dealing with the unquestioning fact-free zone of Woke scamming them is child's play. All you need to pull it off in all these organisations are a few in-the-know agents of the Cult and an army of naïve, reframed, uninformed, narcissistic, know-nothings convinced of their own self-righteousness, self-purity and virtue.

Soros and fellow billionaires and billionaire corporations have poured hundreds of millions into Black Lives Matter and connected groups and promoted them to a global audience. None of this is motivated by caring about black people. These are the billionaires that have controlled and exploited a system that leaves millions of black people in abject poverty and deprivation which they do absolutely nothing to address. The same Cult networks funding BLM were behind the *slave trade!* Black Lives Matter hijacked a phrase that few would challenge and they have turned this laudable concept into a political weapon to divide society. You know that BLM is a fraud when it claims that *All* Lives Matter, the most inclusive statement of all, is 'racist'. BLM and its Cult masters don't want to end racism. To them it's a means to an end to control all of humanity never mind the colour, creed, culture or background. What has destroying the nuclear family got to do with ending racism? Nothing – but that is one of the goals of BLM and also happens to be a goal of the Cult as I have been exposing in my books for decades. Stealing children from loving parents and giving schools ever more power to override parents is part of that same agenda. BLM is a Marxist organisation and why would that not be the case when the Cult created Marxism *and* BLM? Patrisse Cullors, a BLM co-founder, said in a 2015 video that she and her fellow organisers, including co-founder Alicia Garza, are 'trained Marxists'. The lady known after marriage as Patrisse Khan-Cullors bought a $1.4 million home in 2021 in one of the whitest areas of California with a black population of just 1.6 per cent and has so far bought *four* high-end homes for a total of $3.2 million. How very Marxist. There must be a bit of spare in the BLM coffers, however, when Cult corporations and billionaires have handed over the best part of $100 million. Many black people can see that Black Lives Matter is not

working for them, but against them, and this is still more confirmation. Black journalist Jason Whitlock, who had his account suspended by Twitter for simply linking to the story about the 'Marxist's' home buying spree, said that BLM leaders are 'making millions of dollars off the backs of these dead black men who they wouldn't spit on if they were on fire and alive'.

Black Lies Matter

Cult assets and agencies came together to promote BLM in the wake of the death of career criminal George Floyd who had been jailed a number of times including for forcing his way into the home of a black woman with others in a raid in which a gun was pointed at her stomach. Floyd was filmed being held in a Minneapolis street in 2020 with the knee of a police officer on his neck and he subsequently died. It was an appalling thing for the officer to do, but the same technique has been used by police on peaceful protestors of lockdown without any outcry from the Woke brigade. As unquestioning supporters of the Cult agenda Wokers have supported lockdown and all the 'Covid' claptrap while attacking anyone standing up to the tyranny imposed in its name. Court documents would later include details of an autopsy on Floyd by County Medical Examiner Dr Andrew Baker who concluded that Floyd had taken a fatal level of the drug fentanyl. None of this mattered to fact-free, question-free, Woke. Floyd's death was followed by worldwide protests against police brutality amid calls to defund the police. Throwing babies out with the bathwater is a Woke speciality. In the wake of the murder of British woman Sarah Everard a Green Party member of the House of Lords, Baroness Jones of Moulescoomb (Nincompoopia would have been better), called for a 6pm curfew for all men. This would be in breach of the Geneva Conventions on war crimes which ban collective punishment, but that would never have crossed the black and white Woke mind of Baroness Nincompoopia who would have been far too convinced of her own self-righteousness to compute such details. Many American cities did defund the police in the face of Floyd riots

and after $15 million was deleted from the police budget in Washington DC under useless Woke mayor Muriel Bowser car-jacking alone rose by 300 percent and within six months the US capital recorded its highest murder rate in 15 years. The same happened in Chicago and other cities in line with the Cult/Soros plan to bring fear to streets and neighbourhoods by reducing the police, releasing violent criminals and not prosecuting crime. This is the mob-rule agenda that I have warned in the books was coming for so long. Shootings in the area of Minneapolis where Floyd was arrested increased by 2,500 percent compared with the year before. Defunding the police over George Floyd has led to a big increase in dead people with many of them black. Police protection for politicians making these decisions stayed the same or increased as you would expect from professional hypocrites. The Cult doesn't actually want to abolish the police. It wants to abolish local control over the police and hand it to federal government as the psychopaths advance the Hunger Games Society. Many George Floyd protests turned into violent riots with black stores and businesses destroyed by fire and looting across America fuelled by Black Lives Matter. Woke doesn't do irony. If you want civil rights you must loot the liquor store and the supermarket and make off with a smart TV. It's the only way.

It's not a race war – it's a class war

Black people are patronised by privileged blacks and whites alike and told they are victims of white supremacy. I find it extraordinary to watch privileged blacks supporting the very system and bloodline networks behind the slave trade and parroting the same Cult-serving manipulative crap of their privileged white, often billionaire, associates. It is indeed not a race war but a class war and colour is just a diversion. Black Senator Cory Booker and black Congresswoman Maxine Waters, more residents of Nincompoopia, personify this. Once you tell people they are victims of someone else you devalue both their own responsibility for their plight and the power they have to impact on their reality and experience. Instead

we have: 'You are only in your situation because of whitey – turn on them and everything will change.' It won't change. Nothing changes in our lives unless *we* change it. Crucial to that is never seeing yourself as a victim and always as the creator of your reality. Life is a simple sequence of choice and consequence. Make different choices and you create different consequences. *You* have to make those choices – not Black Lives Matter, the Woke Mafia and anyone else that seeks to dictate your life. Who are they these Wokers, an emotional and psychological road traffic accident, to tell you what to do? Personal empowerment is the last thing the Cult and its Black Lives Matter want black people or anyone else to have. They claim to be defending the underdog while *creating* and perpetuating the underdog. The Cult's worst nightmare is human unity and if they are going to keep blacks, whites and every other race under economic servitude and control then the focus must be diverted from what they have in common to what they can be manipulated to believe divides them. Blacks have to be told that their poverty and plight is the fault of the white bloke living on the street in the same poverty and with the same plight they are experiencing. The difference is that your plight black people is due to him, a white supremacist with 'white privilege' living on the street. Don't unite as one human family against your mutual oppressors and suppressors – fight the oppressor with the white face who is as financially deprived as you are. The Cult knows that as its 'Covid' agenda moves into still new levels of extremism people are going to respond and it has been spreading the seeds of disunity everywhere to stop a united response to the evil that targets *all of us*.

Racist attacks on 'whiteness' are getting ever more outrageous and especially through the American Democratic Party which has an appalling history for anti-black racism. Barack Obama, Joe Biden, Hillary Clinton and Nancy Pelosi all eulogised about Senator Robert Byrd at his funeral in 2010 after a nearly 60-year career in Congress. Byrd was a brutal Ku Klux Klan racist and a violent abuser of Cathy O'Brien in MKUltra. He said he would never fight in the military 'with a negro by my side' and 'rather I should die a thousand times,

and see Old Glory trampled in the dirt never to rise again, than to see this beloved land of ours become degraded by race mongrels, a throwback to the blackest specimen from the wilds'. Biden called Byrd a 'very close friend and mentor'. These 'Woke' hypocrites are not anti-racist they are anti-poor and anti-people not of their perceived class. Here is an illustration of the scale of anti-white racism to which we have now descended. Seriously Woke and moronic *New York Times* contributor Damon Young described whiteness as a 'virus' that 'like other viruses will not die until there are no bodies left for it to infect'. He went on: '… the only way to stop it is to locate it, isolate it, extract it, and kill it.' Young can say that as a black man with no consequences when a white man saying the same in reverse would be facing a jail sentence. *That's* racism. We had super-Woke numbskull senators Tammy Duckworth and Mazie Hirono saying they would object to future Biden Cabinet appointments if he did not nominate more Asian Americans and Pacific Islanders. Never mind the ability of the candidate what do they look like? Duckworth said: 'I will vote for racial minorities and I will vote for LGBTQ, but anyone else I'm not voting for.' Appointing people on the grounds of race is illegal, but that was not a problem for this ludicrous pair. They were on-message and that's a free pass in any situation.

Critical race racism

White children are told at school they are intrinsically racist as they are taught the divisive 'critical race theory'. This claims that the law and legal institutions are inherently racist and that race is a socially constructed concept used by white people to further their economic and political interests at the expense of people of colour. White is a 'virus' as we've seen. Racial inequality results from 'social, economic, and legal differences that white people create between races to maintain white interests which leads to poverty and criminality in minority communities'. I must tell that to the white guy sleeping on the street. The principal of East Side Community School in New York sent white parents a manifesto that called on

them to become 'white traitors' and advocate for full 'white abolition'. These people are teaching your kids when they urgently need a psychiatrist. The 'school' included a chart with 'eight white identities' that ranged from 'white supremacist' to 'white abolition' and defined the behaviour white people must follow to end 'the regime of whiteness'. Woke blacks and their privileged white associates are acting exactly like the slave owners of old and Ku Klux Klan racists like Robert Byrd. They are too full of their own self-purity to see that, but it's true. Racism is not a body type; it's a state of mind that can manifest through any colour, creed or culture.

Another racial fraud is *'equity'*. Not equality of treatment and opportunity – equity. It's a term spun as equality when it means something very different. Equality in its true sense is a raising up while 'equity' is a race to the bottom. Everyone in the same level of poverty is 'equity'. Keep everyone down – that's equity. The Cult doesn't want anyone in the human family to be empowered and BLM leaders, like all these 'anti-racist' organisations, continue their privileged, pampered existence by perpetuating the perception of gathering racism. When is the last time you heard an 'anti-racist' or 'anti-Semitism' organisation say that acts of racism and discrimination have *fallen?* It's not in the interests of their fund-raising and power to influence and the same goes for the professional soccer anti-racism operation, Kick It Out. Two things confirmed that the Black Lives Matter riots in the summer of 2020 were Cult creations. One was that while anti-lockdown protests were condemned in this same period for 'transmitting 'Covid' the authorities supported mass gatherings of Black Lives Matter supporters. I even saw self-deluding people claiming to be doctors say the two types of protest were not the same. No – the non-existent 'Covid' was in favour of lockdowns and attacked those that protested against them while 'Covid' supported Black Lives Matter and kept well away from its protests. The whole thing was a joke and as lockdown protestors were arrested, often brutally, by reframed Face-Nappies we had the grotesque sight of police officers taking the knee to Black Lives Matter, a Cult-funded Marxist

organisation that supports violent riots and wants to destroy the nuclear family and white people.

He's not white? Shucks!

Woke obsession with race was on display again when ten people were shot dead in Boulder, Colorado, in March, 2021. Cult-owned Woke TV channels like CNN said the shooter appeared to be a white man and Wokers were on Twitter condemning 'violent white men' with the usual mantras. Then the shooter's name was released as Ahmad Al Aliwi Alissa, an anti-Trump Arab-American, and the sigh of disappointment could be heard five miles away. Never mind that ten people were dead and what that meant for their families. Race baiting was all that mattered to these sick Cult-serving people like Barack Obama who exploited the deaths to further divide America on racial grounds which is his job for the Cult. This is the man that 'racist' white Americans made the first black president of the United States and then gave him a second term. Not-very-bright Obama has become filthy rich on the back of that and today appears to have a big influence on the Biden administration. Even so he's still a downtrodden black man and a victim of white supremacy. This disingenuous fraud reveals the contempt he has for black people when he puts on a Deep South Alabama accent whenever he talks to them, no, *at* them.

Another BLM red flag was how the now fully-Woke (fully-Cult) and fully-virtue-signalled professional soccer authorities had their teams taking the knee before every match in support of Marxist Black Lives Matter. Soccer authorities and clubs displayed 'Black Lives Matter' on the players' shirts and flashed the name on electronic billboards around the pitch. Any fans that condemned what is a Freemasonic taking-the-knee ritual were widely condemned as you would expect from the Woke virtue-signallers of professional sport and the now fully-Woke media. We have reverse racism in which you are banned from criticising any race or culture except for white people for whom anything goes – say what you like, no problem. What has this got to do with racial harmony and

equality? We've had black supremacists from Black Lives Matter telling white people to fall to their knees in the street and apologise for their white supremacy. Black supremacists acting like white supremacist slave owners of the past couldn't breach their self-obsessed, race-obsessed sense of self-purity. Joe Biden appointed a race-obsessed black supremacist Kristen Clarke to head the Justice Department Civil Rights Division. Clarke claimed that blacks are endowed with 'greater mental, physical and spiritual abilities' than whites. If anyone reversed that statement they would be vilified. Clarke is on-message so no problem. She's never seen a black-white situation in which the black figure is anything but a virtuous victim and she heads the Civil Rights Division which should treat everyone the same or it isn't civil rights. Another perception of the Renegade Mind: If something or someone is part of the Cult agenda they will be supported by Woke governments and media no matter what. If they're not, they will be condemned and censored. It really is that simple and so racist Clarke prospers despite (make that because of) her racism.

The end of culture

Biden's administration is full of such racial, cultural and economic bias as the Cult requires the human family to be divided into warring factions. We are now seeing racially-segregated graduations and everything, but everything, is defined through the lens of perceived 'racism. We have 'racist' mathematics, 'racist' food and even 'racist' *plants*. World famous Kew Gardens in London said it was changing labels on plants and flowers to tell its pre-'Covid' more than two million visitors a year how racist they are. Kew director Richard Deverell said this was part of an effort to 'move quickly to decolonise collections' after they were approached by one Ajay Chhabra 'an actor with an insight into how sugar cane was linked to slavery'. They are *plants* you idiots. 'Decolonisation' in the Woke manual really means colonisation of society with its mentality and by extension colonisation by the Cult. We are witnessing a new Chinese-style 'Cultural Revolution' so essential to the success of all

Marxist takeovers. Our cultural past and traditions have to be swept away to allow a new culture to be built-back-better. Woke targeting of long-standing Western cultural pillars including historical monuments and cancelling of historical figures is what happened in the Mao revolution in China which 'purged remnants of capitalist and traditional elements from Chinese society' and installed Maoism as the dominant ideology'. For China see the Western world today and for 'dominant ideology' see Woke. Better still see Marxism or Maoism. The 'Covid' hoax has specifically sought to destroy the arts and all elements of Western culture from people meeting in a pub or restaurant to closing theatres, music venues, sports stadiums, places of worship and even banning *singing*. Destruction of Western society is also why criticism of any religion is banned except for Christianity which again is the dominant religion as white is the numerically-dominant race. Christianity may be fading rapidly, but its history and traditions are weaved through the fabric of Western society. Delete the pillars and other structures will follow until the whole thing collapses. I am not a Christian defending that religion when I say that. I have no religion. It's just a fact. To this end Christianity has itself been turned Woke to usher its own downfall and its ranks are awash with 'change agents' – knowing and unknowing – at every level including Pope Francis (*definitely* knowing) and the clueless Archbishop of Canterbury Justin Welby (possibly not, but who can be sure?). Woke seeks to coordinate attacks on Western culture, traditions, and ways of life through 'intersectionality' defined as 'the complex, cumulative way in which the effects of multiple forms of discrimination (such as racism, sexism, and classism) combine, overlap, or intersect especially in the experiences of marginalised individuals or groups'. Wade through the Orwellian Woke-speak and this means coordinating disparate groups in a common cause to overthrow freedom and liberal values.

The entire structure of public institutions has been infested with Woke – government at all levels, political parties, police, military, schools, universities, advertising, media and trade unions. This abomination has been achieved through the Cult web by appointing

Wokers to positions of power and battering non-Wokers into line through intimidation, isolation and threats to their job. Many have been fired in the wake of the empathy-deleted, vicious hostility of 'social justice' Wokers and the desire of gutless, spineless employers to virtue-signal their Wokeness. Corporations are filled with Wokers today, most notably those in Silicon Valley. Ironically at the top they are not Woke at all. They are only exploiting the mentality their Cult masters have created and funded to censor and enslave while the Wokers cheer them on until it's their turn. Thus the Woke 'liberal left' is an inversion of the traditional liberal left. Campaigning for justice on the grounds of power and wealth distribution has been replaced by campaigning for identity politics. The genuine traditional left would never have taken money from today's billionaire abusers of fairness and justice and nor would the billionaires have wanted to fund that genuine left. It would not have been in their interests to do so. The division of opinion in those days was between the haves and have nots. This all changed with Cult manipulated and funded identity politics. The division of opinion today is between Wokers and non-Wokers and not income brackets. Cult corporations and their billionaires may have taken wealth disparity to cataclysmic levels of injustice, but as long as they speak the language of Woke, hand out the dosh to the Woke network and censor the enemy they are 'one of us'. Billionaires who don't give a damn about injustice are laughing at them till their bellies hurt. Wokers are not even close to self-aware enough to see that. The transformed 'left' dynamic means that Wokers who drone on about 'social justice' are funded by billionaires that have destroyed social justice the world over. It's *why* they are billionaires.

The climate con

Nothing encapsulates what I have said more comprehensively than the hoax of human-caused global warming. I have detailed in my books over the years how Cult operatives and organisations were the pump-primers from the start of the climate con. A purpose-built vehicle for this is the Club of Rome established by the Cult in 1968

with the Rockefellers and Rothschilds centrally involved all along. Their gofer frontman Maurice Strong, a Canadian oil millionaire, hosted the Earth Summit in Rio de Janeiro, Brazil, in 1992 where the global 'green movement' really expanded in earnest under the guiding hand of the Cult. The Earth Summit established Agenda 21 through the Cult-created-and-owned United Nations to use the illusion of human-caused climate change to justify the transformation of global society to save the world from climate disaster. It is a No-Problem-Reaction-Solution sold through governments, media, schools and universities as whole generations have been terrified into believing that the world was going to end in their lifetimes unless what old people had inflicted upon them was stopped by a complete restructuring of how everything is done. Chill, kids, it's all a hoax. Such restructuring is precisely what the Cult agenda demands (purely by coincidence of course). Today this has been given the codename of the Great Reset which is only an updated term for Agenda 21 and its associated Agenda 2030. The latter, too, is administered through the UN and was voted into being by the General Assembly in 2015. Both 21 and 2030 seek centralised control of all resources and food right down to the raindrops falling on your own land. These are some of the demands of Agenda 21 established in 1992. See if you recognise this society emerging today:

- End national sovereignty
- State planning and management of all land resources, ecosystems, deserts, forests, mountains, oceans and fresh water; agriculture; rural development; biotechnology; and ensuring *'equity'*
- The state to 'define the role' of business and financial resources
- Abolition of private property
- 'Restructuring' the family unit (see BLM)
- Children raised by the state
- People told what their job will be
- Major restrictions on movement
- Creation of 'human settlement zones'

- Mass resettlement as people are forced to vacate land where they live
- Dumbing down education
- Mass global depopulation in pursuit of all the above

The United Nations was created as a Trojan horse for world government. With the climate con of critical importance to promoting that outcome you would expect the UN to be involved. Oh, it's involved all right. The UN is promoting Agenda 21 and Agenda 2030 justified by 'climate change' while also driving the climate hoax through its Intergovernmental Panel on Climate Change (IPCC), one of the world's most corrupt organisations. The IPCC has been lying ferociously and constantly since the day it opened its doors with the global media hanging unquestioningly on its every mendacious word. The Green movement is entirely Woke and has long lost its original environmental focus since it was co-opted by the Cult. An obsession with 'global warming' has deleted its values and scrambled its head. I experienced a small example of what I mean on a beautiful country walk that I have enjoyed several times a week for many years. The path merged into the fields and forests and you felt at one with the natural world. Then a 'Green' organisation, the Hampshire and Isle of Wight Wildlife Trust, took over part of the land and proceeded to cut down a large number of trees, including mature ones, to install a horrible big, bright steel 'this-is-ours-stay-out' fence that destroyed the whole atmosphere of this beautiful place. No one with a feel for nature would do that. Day after day I walked to the sound of chainsaws and a magnificent mature weeping willow tree that I so admired was cut down at the base of the trunk. When I challenged a Woke young girl in a green shirt (of course) about this vandalism she replied: 'It's a weeping willow – it will grow back.' This is what people are paying for when they donate to the Hampshire and Isle of Wight Wildlife Trust and many other 'green' organisations today. It is not the environmental movement that I knew and instead has become a support-system – as with Extinction Rebellion – for a very dark agenda.

Private jets for climate justice

The Cult-owned, Gates-funded, World Economic Forum and its founder Klaus Schwab were behind the emergence of Greta Thunberg to harness the young behind the climate agenda and she was invited to speak to the world at … the UN. Schwab published a book, *Covid-19: The Great Reset* in 2020 in which he used the 'Covid' hoax and the climate hoax to lay out a new society straight out of Agenda 21 and Agenda 2030. Bill Gates followed in early 2021 when he took time out from destroying the world to produce a book in his name about the way to save it. Gates flies across the world in private jets and admitted that 'I probably have one of the highest greenhouse gas footprints of anyone on the planet … my personal flying alone is gigantic.' He has also bid for the planet's biggest private jet operator. Other climate change saviours who fly in private jets include John Kerry, the US Special Presidential Envoy for Climate, and actor Leonardo DiCaprio, a 'UN Messenger of Peace with special focus on climate change'. These people are so full of bullshit they could corner the market in manure. We mustn't be sceptical, though, because the Gates book, *How to Avoid a Climate Disaster: The Solutions We Have and the Breakthroughs We Need*, is a genuine attempt to protect the world and not an obvious pile of excrement attributed to a mega-psychopath aimed at selling his masters' plans for humanity. The Gates book and the other shite-pile by Klaus Schwab could have been written by the same person and may well have been. Both use 'climate change' and 'Covid' as the excuses for their new society and by coincidence the Cult's World Economic Forum and Bill and Melinda Gates Foundation promote the climate hoax and hosted Event 201 which pre-empted with a 'simulation' the very 'coronavirus' hoax that would be simulated for real on humanity within weeks. The British 'royal' family is promoting the 'Reset' as you would expect through Prince 'climate change caused the war in Syria' Charles and his hapless son Prince William who said that we must 'reset our relationship with nature and our trajectory as a species' to avoid a climate disaster. Amazing how many promotors of the 'Covid' and 'climate change' control

systems are connected to Gates and the World Economic Forum. A 'study' in early 2021 claimed that carbon dioxide emissions must fall by the equivalent of a global lockdown roughly every two years for the next decade to save the planet. The 'study' appeared in the same period that the Schwab mob claimed in a video that lockdowns destroying the lives of billions are good because they make the earth 'quieter' with less 'ambient noise'. They took down the video amid a public backlash for such arrogant, empathy-deleted stupidity You see, however, where they are going with this. Corinne Le Quéré, a professor at the Tyndall Centre for Climate Change Research, University of East Anglia, was lead author of the climate lockdown study, and she writes for … the World Economic Forum. Gates calls in 'his' book for changing 'every aspect of the economy' (long-time Cult agenda) and for humans to eat synthetic 'meat' (predicted in my books) while cows and other farm animals are eliminated. Australian TV host and commentator Alan Jones described what carbon emission targets would mean for farm animals in Australia alone if emissions were reduced as demanded by 35 percent by 2030 and zero by 2050:

Well, let's take agriculture, the total emissions from agriculture are about 75 million tonnes of carbon dioxide, equivalent. Now reduce that by 35 percent and you have to come down to 50 million tonnes, I've done the maths. So if you take for example 1.5 million cows, you're going to have to reduce the herd by 525,000 [by] 2030, nine years, that's 58,000 cows a year. The beef herd's 30 million, reduce that by 35 percent, that's 10.5 million, which means 1.2 million cattle have to go every year between now and 2030. This is insanity!

There are 75 million sheep. Reduce that by 35 percent, that's 26 million sheep, that's almost 3 million a year. So under the Paris Agreement over 30 million beasts. dairy cows, cattle, pigs and sheep would go. More than 8,000 every minute of every hour for the next decade, do these people know what they're talking about?

Clearly they don't at the level of campaigners, politicians and administrators. The Cult *does* know; that's the outcome it wants. We are faced with not just a war on humanity. Animals and the natural world are being targeted and I have been saying since the 'Covid' hoax began that the plan eventually was to claim that the 'deadly virus' is able to jump from animals, including farm animals and

domestic pets, to humans. Just before this book went into production came this story: 'Russia registers world's first Covid-19 vaccine for cats & dogs as makers of Sputnik V warn pets & farm animals could spread virus'. The report said 'top scientists warned that the deadly pathogen could soon begin spreading through homes and farms' and 'the next stage is the infection of farm and domestic animals'. Know the outcome and you'll see the journey. Think what that would mean for animals and keep your eye on a term called zoonosis or zoonotic diseases which transmit between animals and humans. The Cult wants to break the connection between animals and people as it does between people and people. Farm animals fit with the Cult agenda to transform food from natural to synthetic.

The gas of life is killing us

There can be few greater examples of Cult inversion than the condemnation of carbon dioxide as a dangerous pollutant when it is the gas of life. Without it the natural world would be dead and so we would all be dead. We breathe in oxygen and breathe out carbon dioxide while plants produce oxygen and absorb carbon dioxide. It is a perfect symbiotic relationship that the Cult wants to dismantle for reasons I will come to in the final two chapters. Gates, Schwab, other Cult operatives and mindless repeaters, want the world to be 'carbon neutral' by at least 2050 and the earlier the better. 'Zero carbon' is the cry echoed by lunatics calling for 'Zero Covid' when we already have it. These carbon emission targets will deindustrialise the world in accordance with Cult plans – the post-industrial, post-democratic society – and with so-called renewables like solar and wind not coming even close to meeting human energy needs blackouts and cold are inevitable. Texans got the picture in the winter of 2021 when a snow storm stopped wind turbines and solar panels from working and the lights went down along with water which relies on electricity for its supply system. Gates wants everything to be powered by electricity to ensure that his masters have the kill switch to stop all human activity, movement, cooking, water and warmth any time they like. The climate lie is so

stupendously inverted that it claims we must urgently reduce carbon dioxide when we *don't have enough*.

Co2 in the atmosphere is a little above 400 parts per million when the optimum for plant growth is 2,000 ppm and when it falls anywhere near 150 ppm the natural world starts to die and so do we. It fell to as low as 280 ppm in an 1880 measurement in Hawaii and rose to 413 ppm in 2019 with industrialisation which is why the planet has become *greener* in the industrial period. How insane then that psychopathic madman Gates is not satisfied only with blocking the rise of Co2. He's funding technology to suck it out of the atmosphere. The reason why will become clear. The industrial era is not destroying the world through Co2 and has instead turned around a potentially disastrous ongoing fall in Co2. Greenpeace co-founder and scientist Patrick Moore walked away from Greenpeace in 1986 and has exposed the green movement for fear-mongering and lies. He said that 500 million years ago there was *17 times* more Co2 in the atmosphere than we have today and levels have been falling for hundreds of millions of years. In the last 150 million years Co2 levels in Earth's atmosphere had reduced by *90 percent*. Moore said that by the time humanity began to unlock carbon dioxide from fossil fuels we were at '38 seconds to midnight' and in that sense: 'Humans are [the Earth's] salvation.' Moore made the point that only half the Co2 emitted by fossil fuels stays in the atmosphere and we should remember that all pollution pouring from chimneys that we are told is carbon dioxide is in fact nothing of the kind. It's pollution. Carbon dioxide is an invisible gas.

William Happer, Professor of Physics at Princeton University and long-time government adviser on climate, has emphasised the Co2 deficiency for maximum growth and food production. Greenhouse growers don't add carbon dioxide for a bit of fun. He said that most of the warming in the last 100 years, after the earth emerged from the super-cold period of the 'Little Ice Age' into a natural warming cycle, was over by 1940. Happer said that a peak year for warming in 1988 can be explained by a 'monster El Nino' which is a natural and cyclical warming of the Pacific that has nothing to do with 'climate

change'. He said the effect of Co2 could be compared to painting a wall with red paint in that once two or three coats have been applied it didn't matter how much more you slapped on because the wall will not get much redder. Almost all the effect of the rise in Co2 has already happened, he said, and the volume in the atmosphere would now have to *double* to increase temperature by a single degree. Climate hoaxers know this and they have invented the most ridiculously complicated series of 'feedback' loops to try to overcome this rather devastating fact. You hear puppet Greta going on cluelessly about feedback loops and this is why.

The Sun affects temperature? No you *climate denier*

Some other nonsense to contemplate: Climate graphs show that rises in temperature do not follow rises in Co2 – *it's the other way round* with a lag between the two of some 800 years. If we go back 800 years from present time we hit the Medieval Warm Period when temperatures were higher than now without any industrialisation and this was followed by the Little Ice Age when temperatures plummeted. The world was still emerging from these centuries of serious cold when many climate records began which makes the ever-repeated line of the 'hottest year since records began' meaningless when you are not comparing like with like. The coldest period of the Little Ice Age corresponded with the lowest period of sunspot activity when the Sun was at its least active. Proper scientists will not be at all surprised by this when it confirms the obvious fact that earth temperature is affected by the scale of Sun activity and the energetic power that it subsequently emits; but when is the last time you heard a climate hoaxer talking about the Sun as a source of earth temperature?? Everything has to be focussed on Co2 which makes up just 0.117 percent of so-called greenhouse gases and only a fraction of even that is generated by human activity. The rest is natural. More than *90 percent* of those greenhouse gases are water vapour and clouds (Fig 9). Ban moisture I say. Have you noticed that the climate hoaxers no longer use the polar bear as their promotion image? That's because far from becoming extinct polar

bear communities are stable or thriving. Joe Bastardi, American meteorologist, weather forecaster and outspoken critic of the climate lie, documents in his book *The Climate Chronicles* how weather patterns and events claimed to be evidence of climate change have been happening since long before industrialisation: 'What happened before naturally is happening again, as is to be expected given the cyclical nature of the climate due to the design of the planet.' If you read the detailed background to the climate hoax in my other books you will shake your head and wonder how anyone could believe the crap which has spawned a multi-trillion dollar industry based on absolute garbage (see HIV causes AIDs and Sars-Cov-2 causes 'Covid-19'). Climate and 'Covid' have much in common given they have the same source. They both have the contradictory *everything* factor in which everything is explained by reference to them. It's hot – 'it's climate change'. It's cold – 'it's climate change'. I got a sniffle – 'it's Covid'. I haven't got a sniffle – 'it's Covid'. Not having a sniffle has to be a symptom of 'Covid'. Everything is and not having a sniffle is especially dangerous if you are a slow walker. For sheer audacity I offer you a Cambridge University 'study' that actually linked 'Covid' to 'climate change'. It had to happen eventually. They concluded that climate change played a role in 'Covid-19' spreading from animals to humans because … wait for it … I kid you not … *the two groups were forced closer together as populations grow*. Er, that's it. The whole foundation on which this depended was that 'Bats are the likely zoonotic origin of SARS-CoV-1 and SARS-CoV-2'. Well, they are not. They are nothing to do with it. Apart from bats not being the origin and therefore 'climate change' effects on bats being irrelevant I am in awe of their academic insight. Where would we be without them? Not where we are that's for sure.

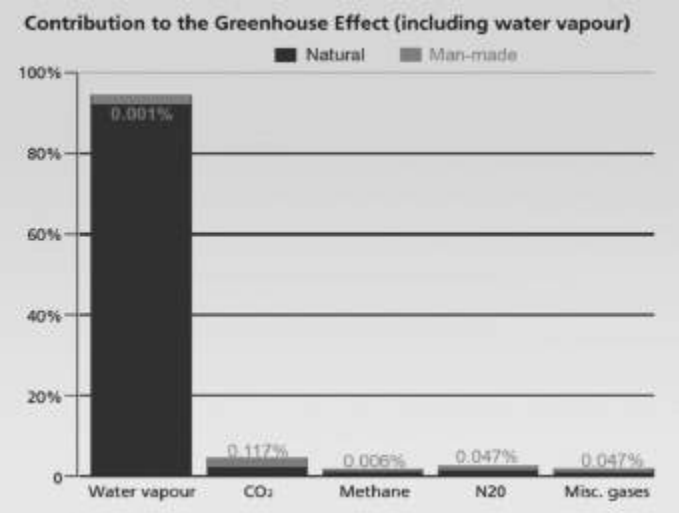

Figure 9: The idea that the gas of life is disastrously changing the climate is an insult to brain cell activity.

One other point about the weather is that climate modification is now well advanced and not every major weather event is natural – or earthquake come to that. I cover this subject at some length in other books. China is openly planning a rapid expansion of its weather modification programme which includes changing the climate in an area more than one and a half times the size of India. China used weather manipulation to ensure clear skies during the 2008 Olympics in Beijing. I have quoted from US military documents detailing how to employ weather manipulation as a weapon of war and they did that in the 1960s and 70s during the conflict in Vietnam with Operation Popeye manipulating monsoon rains for military purposes. Why would there be international treaties on weather modification if it wasn't possible? Of course it is. Weather is energetic information and it can be changed.

How was the climate hoax pulled off? See 'Covid'

If you can get billions to believe in a 'virus' that doesn't exist you can get them to believe in human-caused climate change that doesn't exist. Both are being used by the Cult to transform global society in the way it has long planned. Both hoaxes have been achieved in pretty much the same way. First you declare a lie is a fact. There's a

'virus' you call SARS-Cov-2 or humans are warming the planet with their behaviour. Next this becomes, via Cult networks, the foundation of government, academic and science policy and belief. Those who parrot the mantra are given big grants to produce research that confirms the narrative is true and ever more 'symptoms' are added to make the 'virus'/'climate change' sound even more scary. Scientists and researchers who challenge the narrative have their grants withdrawn and their careers destroyed. The media promote the lie as the unquestionable truth and censor those with an alternative view or evidence. A great percentage of the population believe what they are told as the lie becomes an everybody-knows-that and the believing-masses turn on those with a mind of their own. The technique has been used endlessly throughout human history. Wokers are the biggest promotors of the climate lie *and* 'Covid' fascism because their minds are owned by the Cult; their sense of self-righteous self-purity knows no bounds; and they exist in a bubble of reality in which facts are irrelevant and only get in the way of looking without seeing.

Running through all of this like veins in a blue cheese is control of information, which means control of perception, which means control of behaviour, which collectively means control of human society. The Cult owns the global media and Silicon Valley fascists for the simple reason that it *has* to. Without control of information it can't control perception and through that human society. Examine every facet of the Cult agenda and you will see that anything supporting its introduction is never censored while anything pushing back is always censored. I say again: Psychopaths that know why they are doing this must go before Nuremberg trials and those that follow their orders must trot along behind them into the same dock. 'I was just following orders' didn't work the first time and it must not work now. Nuremberg trials must be held all over the world before public juries for politicians, government officials, police, compliant doctors, scientists and virologists, and all Cult operatives such as Gates, Tedros, Fauci, Vallance, Whitty, Ferguson, Zuckerberg, Wojcicki, Brin, Page, Dorsey, the whole damn lot of

them – including, no *especially*, the psychopath psychologists. Without them and the brainless, gutless excuses for journalists that have repeated their lies, none of this could be happening. Nobody can be allowed to escape justice for the psychological and economic Armageddon they are all responsible for visiting upon the human race.

As for the compliant, unquestioning, swathes of humanity, and the self-obsessed, all-knowing ignorance of the Wokers … don't start me. God help their kids. God help their grandkids. God *help them*.

CHAPTER NINE

We must have it? So what is it?

Well I won't back down. No, I won't back down. You can stand me up at the Gates of Hell. But I won't back down
Tom Petty

I will now focus on the genetically-manipulating 'Covid vaccines' which do not meet this official definition of a vaccine by the US Centers for Disease Control (CDC): 'A product that stimulates a person's immune system to produce immunity to a specific disease, protecting the person from that disease.' On that basis 'Covid vaccines' are not a vaccine in that the makers don't even claim they stop infection or transmission.

They are instead part of a multi-levelled conspiracy to change the nature of the human body and what it means to be 'human' and to depopulate an enormous swathe of humanity. What I shall call Human 1.0 is on the cusp of becoming Human 2.0 and for very sinister reasons. Before I get to the 'Covid vaccine' in detail here's some background to vaccines in general. Government regulators do not test vaccines – the makers do – and the makers control which data is revealed and which isn't. Children in America are given 50 vaccine doses by age six and 69 by age 19 and the effect of the whole combined schedule has never been tested. Autoimmune diseases when the immune system attacks its own body have soared in the mass vaccine era and so has disease in general in children and the young. Why wouldn't this be the case when vaccines target the *immune system?* The US government gave Big Pharma drug

companies immunity from prosecution for vaccine death and injury in the 1986 National Childhood Vaccine Injury Act (NCVIA) and since then the government (taxpayer) has been funding compensation for the consequences of Big Pharma vaccines. The criminal and satanic drug giants can't lose and the vaccine schedule has increased dramatically since 1986 for this reason. There is no incentive to make vaccines safe and a big incentive to make money by introducing ever more. Even against a ridiculously high bar to prove vaccine liability, and with the government controlling the hearing in which it is being challenged for compensation, the vaccine court has so far paid out more than $4 billion. These are the vaccines we are told are safe and psychopaths like Zuckerberg censor posts saying otherwise. The immunity law was even justified by a ruling that vaccines by their nature were 'unavoidably unsafe'.

Check out the ingredients of vaccines and you will be shocked if you are new to this. *They put that in children's bodies?? What??* Try aluminium, a brain toxin connected to dementia, aborted foetal tissue and formaldehyde which is used to embalm corpses. World-renowned aluminium expert Christopher Exley had his research into the health effect of aluminium in vaccines shut down by Keele University in the UK when it began taking funding from the Bill and Melinda Gates Foundation. Research when diseases 'eradicated' by vaccines began to decline and you will find the fall began long *before* the vaccine was introduced. Sometimes the fall even plateaued after the vaccine. Diseases like scarlet fever for which there was no vaccine declined in the same way because of environmental and other factors. A perfect case in point is the polio vaccine. Polio began when lead arsenate was first sprayed as an insecticide and residues remained in food products. Spraying started in 1892 and the first US polio epidemic came in Vermont in 1894. The simple answer was to stop spraying, but Rockefeller-created Big Pharma had a better idea. Polio was decreed to be caused by the *poliovirus* which 'spreads from person to person and can infect a person's spinal cord'. Lead arsenate was replaced by the lethal DDT which had the same effect of causing paralysis by damaging the brain and central nervous

system. Polio plummeted when DDT was reduced and then banned, but the vaccine is still given the credit for something it didn't do. Today by far the biggest cause of polio is the vaccines promoted by Bill Gates. Vaccine justice campaigner Robert Kennedy Jr, son of assassinated (by the Cult) US Attorney General Robert Kennedy, wrote:

> In 2017, the World Health Organization (WHO) reluctantly admitted that the global explosion in polio is predominantly vaccine strain. The most frightening epidemics in Congo, Afghanistan, and the Philippines, are all linked to vaccines. In fact, by 2018, 70% of global polio cases were vaccine strain.

Vaccines make fortunes for Cult-owned Gates and Big Pharma while undermining the health and immune systems of the population. We had a glimpse of the mentality behind the Big Pharma cartel with a report on WION (World is One News), an international English language TV station based in India, which exposed the extraordinary behaviour of US drug company Pfizer over its 'Covid vaccine'. The WION report told how Pfizer had made fantastic demands of Argentina, Brazil and other countries in return for its 'vaccine'. These included immunity from prosecution, even for Pfizer negligence, government insurance to protect Pfizer from law suits and handing over as collateral sovereign assets of the country to include Argentina's bank reserves, military bases and embassy buildings. Pfizer demanded the same of Brazil in the form of waiving sovereignty of its assets abroad; exempting Pfizer from Brazilian laws; and giving Pfizer immunity from all civil liability. This is a 'vaccine' developed with government funding. Big Pharma is evil incarnate as a creation of the Cult and all must be handed tickets to Nuremberg.

Phantom 'vaccine' for a phantom 'disease'

I'll expose the 'Covid vaccine' fraud and then go on to the wider background of why the Cult has set out to 'vaccinate' every man, woman and child on the planet for an alleged 'new disease' with a survival rate of 99.77 percent (or more) even by the grotesquely-

manipulated figures of the World Health Organization and Johns Hopkins University. The 'infection' to 'death' ratio is 0.23 to 0.15 percent according to Stanford epidemiologist Dr John Ioannidis and while estimates vary the danger remains tiny. I say that if the truth be told the fake infection to fake death ratio is zero. Never mind all the evidence I have presented here and in *The Answer* that there is no 'virus' let us just focus for a moment on that death-rate figure of say 0.23 percent. The figure includes all those worldwide who have tested positive with a test not testing for the 'virus' and then died within 28 days or even longer of any other cause – *any other cause*. Now subtract all those illusory 'Covid' deaths on the global data sheets from the 0.23 percent. What do you think you would be left with? *Zero*. A vaccination has never been successfully developed for a so-called coronavirus. They have all failed at the animal testing stage when they caused hypersensitivity to what they were claiming to protect against and made the impact of a disease far worse. Cult-owned vaccine corporations got around that problem this time by bypassing animal trials, going straight to humans and making the length of the 'trials' before the public rollout as short as they could get away with. Normally it takes five to ten years or more to develop vaccines that still cause demonstrable harm to many people and that's without including the long-term effects that are never officially connected to the vaccination. 'Covid' non-vaccines have been officially produced and approved in a matter of months from a standing start and part of the reason is that (a) they were developed before the 'Covid' hoax began and (b) they are based on computer programs and not natural sources. Official non-trials were so short that government agencies gave *emergency*, not full, approval. 'Trials' were not even completed and full approval cannot be secured until they are. Public 'Covid vaccination' is actually a *continuation of the trial*. Drug company 'trials' are not scheduled to end until 2023 by which time a lot of people are going to be dead. Data on which government agencies gave this emergency approval was supplied by the Big Pharma corporations themselves in the form of Pfizer/BioNTech, AstraZeneca, Moderna, Johnson & Johnson, and

others, and this is the case with all vaccines. By its very nature *emergency* approval means drug companies do not have to prove that the 'vaccine' is 'safe and effective'. How could they with trials way short of complete? Government regulators only have to *believe* that they *could* be safe and effective. It is criminal manipulation to get products in circulation with no testing worth the name. Agencies giving that approval are infested with Big Pharma-connected place-people and they act in the interests of Big Pharma (the Cult) and not the public about whom they do not give a damn.

More human lab rats

'Covid vaccines' produced in record time by Pfizer/BioNTech and Moderna employ a technique *never approved before for use on humans*. They are known as mRNA 'vaccines' and inject a synthetic version of 'viral' mRNA or 'messenger RNA'. The key is in the term 'messenger'. The body works, or doesn't, on the basis of information messaging. Communications are constantly passing between and within the genetic system and the brain. Change those messages and you change the state of the body and even its very nature and you can change psychology and behaviour by the way the brain processes information. I think you are going to see significant changes in personality and perception of many people who have had the 'Covid vaccine' synthetic potions. Insider Aldous Huxley predicted the following in 1961 and mRNA 'vaccines' can be included in the term 'pharmacological methods':

> There will be, in the next generation or so, a pharmacological method of making people love their servitude, and producing dictatorship without tears, so to speak, producing a kind of painless concentration camp for entire societies, so that people will in fact have their own liberties taken away from them, but rather enjoy it, because they will be distracted from any desire to rebel by propaganda or brainwashing, or brainwashing enhanced by pharmacological methods. And this seems to be the final revolution.

Apologists claim that mRNA synthetic 'vaccines' don't change the DNA genetic blueprint because RNA does not affect DNA only the other way round. This is so disingenuous. A process called 'reverse

transcription' can convert RNA into DNA and be integrated into DNA in the cell nucleus. This was highlighted in December, 2020, by scientists at Harvard and Massachusetts Institute of Technology (MIT). Geneticists report that more than 40 percent of mammalian genomes results from reverse transcription. On the most basic level if messaging changes then that sequence must lead to changes in DNA which is receiving and transmitting those communications. How can introducing synthetic material into cells not change the cells where DNA is located? The process is known as transfection which is defined as 'a technique to insert foreign nucleic acid (DNA or RNA) into a cell, typically with the intention of altering the properties of the cell'. Researchers at the Sloan Kettering Institute in New York found that changes in messenger RNA can deactivate tumour-suppressing proteins and thereby promote cancer. This is what happens when you mess with messaging. 'Covid vaccine' maker Moderna was founded in 2010 by Canadian stem cell biologist Derrick J. Rossi after his breakthrough discovery in the field of transforming and reprogramming stem cells. These are neutral cells that can be programmed to become any cell including sperm cells. Moderna was therefore founded on the principle of genetic manipulation and has never produced any vaccine or drug before its genetically-manipulating synthetic 'Covid' shite. Look at the name – Mode-RNA or Modify-RNA. Another important point is that the US Supreme Court has ruled that genetically-modified DNA, or complementary DNA (cDNA) synthesized in the laboratory from messenger RNA, can be patented and owned. These psychopaths are doing this to the human body.

Cells replicate synthetic mRNA in the 'Covid vaccines' and in theory the body is tricked into making antigens which trigger antibodies to target the 'virus spike proteins' which as Dr Tom Cowan said have *never been seen*. Cut the crap and these 'vaccines' deliver *self-replicating* synthetic material to the cells with the effect of changing human DNA. The more of them you have the more that process is compounded while synthetic material is all the time self-replicating. 'Vaccine'-maker Moderna describes mRNA as 'like

software for the cell' and so they are messing with the body's software. What happens when you change the software in a computer? Everything changes. For this reason the Cult is preparing a production line of mRNA 'Covid vaccines' and a long list of excuses to use them as with all the 'variants' of a 'virus' never shown to exist. The plan is further to transfer the mRNA technique to other vaccines mostly given to children and young people. The cumulative consequences will be a transformation of human DNA through a constant infusion of synthetic genetic material which will kill many and change the rest. Now consider that governments that have given emergency approval for a vaccine that's not a vaccine; never been approved for humans before; had no testing worth the name; and the makers have been given immunity from prosecution for any deaths or adverse effects suffered by the public. The UK government awarded *permanent legal indemnity* to itself and its employees for harm done when a patient is being treated for 'Covid-19' or 'suspected Covid-19'. That is quite a thought when these are possible 'side-effects' from the 'vaccine' (they are not 'side', they are effects) listed by the US Food and Drug Administration:

Guillain-Barre syndrome; acute disseminated encephalomyelitis; transverse myelitis; encephalitis; myelitis; encephalomyelitis; meningoencephalitis; meningitis; encephalopathy; convulsions; seizures; stroke; narcolepsy; cataplexy; anaphylaxis; acute myocardial infarction (heart attack); myocarditis; pericarditis; autoimmune disease; death; implications for pregnancy, and birth outcomes; other acute demyelinating diseases; non anaphylactic allergy reactions; thrombocytopenia ; disseminated intravascular coagulation; venous thromboembolism; arthritis; arthralgia; joint pain; Kawasaki disease; multisystem inflammatory syndrome in children; vaccine enhanced disease. The latter is the way the 'vaccine' has the potential to make diseases far worse than they would otherwise be.

UK doctor and freedom campaigner Vernon Coleman described the conditions in this list as 'all unpleasant, most of them very serious, and you can't get more serious than death'. The thought that anyone at all has had the 'vaccine' in these circumstances is testament to the potential that humanity has for clueless, unquestioning, stupidity and for many that programmed stupidity has already been terminal.

An insider speaks

Dr Michael Yeadon is a former Vice President, head of research and Chief Scientific Adviser at vaccine giant Pfizer. Yeadon worked on the inside of Big Pharma, but that did not stop him becoming a vocal critic of 'Covid vaccines' and their potential for multiple harms, including infertility in women. By the spring of 2021 he went much further and even used the no, no, term 'conspiracy'. When you begin to see what is going on it is impossible not to do so. Yeadon spoke out in an interview with freedom campaigner James Delingpole and I mentioned earlier how he said that no one had samples of 'the virus'. He explained that the mRNA technique originated in the anti-cancer field and ways to turn on and off certain genes which could be advantageous if you wanted to stop cancer growing out of control. 'That's the origin of them. They are a very unusual application, really.' Yeadon said that treating a cancer patient with an aggressive procedure might be understandable if the alternative was dying, but it was quite another thing to use the same technique as a public health measure. Most people involved wouldn't catch the infectious agent you were vaccinating against and if they did they probably wouldn't die:

> If you are really using it as a public health measure you really want to as close as you can get to zero sides-effects … I find it odd that they chose techniques that were really cutting their teeth in the field of oncology and I'm worried that in using gene-based vaccines that have to be injected in the body and spread around the body, get taken up into some cells, and the regulators haven't quite told us which cells they get taken up into … you are going to be generating a wide range of responses … with multiple steps each of which could go well or badly.

I doubt the Cult intends it to go well. Yeadon said that you can put any gene you like into the body through the 'vaccine'. 'You can certainly give them a gene that would do them some harm if you wanted.' I was intrigued when he said that when used in the cancer field the technique could turn genes on and off. I explore this process in *The Answer* and with different genes having different functions you could create mayhem – physically and psychologically – if you turned the wrong ones on and the right ones off. I read reports of an experiment by researchers at the University of Washington's school of computer science and engineering in which they encoded DNA to infect computers. The body is itself a biological computer and if human DNA can inflict damage on a computer why can't the computer via synthetic material mess with the human body? It can. The Washington research team said it was possible to insert malicious malware into 'physical DNA strands' and corrupt the computer system of a gene sequencing machine as it 'reads gene letters and stores them as binary digits 0 and 1'. They concluded that hackers could one day use blood or spit samples to access computer systems and obtain sensitive data from police forensics labs or infect genome files. It is at this level of digital interaction that synthetic 'vaccines' need to be seen to get the full picture and that will become very clear later on. Michael Yeadon said it made no sense to give the 'vaccine' to younger people who were in no danger from the 'virus'. What was the benefit? It was all downside with potential effects:

> The fact that my government in what I thought was a civilised, rational country, is raining [the 'vaccine'] on people in their 30s and 40s, even my children in their 20s, they're getting letters and phone calls, I know this is not right and any of you doctors who are vaccinating you know it's not right, too. They are not at risk. They are not at risk from the disease, so you are now hoping that the side-effects are so rare that you get away with it. You don't give new technology … that you don't understand to 100 percent of the population.

Blood clot problems with the AstraZeneca 'vaccine' have been affecting younger people to emphasise the downside risks with no benefit. AstraZeneca's version, produced with Oxford University, does not use mRNA, but still gets its toxic cocktail inside cells where

it targets DNA. The Johnson & Johnson 'vaccine' which uses a similar technique has also produced blood clot effects to such an extent that the United States paused its use at one point. They are all 'gene therapy' (cell modification) procedures and not 'vaccines'. The truth is that once the content of these injections enter cells we have no idea what the effect will be. People can speculate and some can give very educated opinions and that's good. In the end, though, only the makers know what their potions are designed to do and even they won't know every last consequence. Michael Yeadon was scathing about doctors doing what they knew to be wrong. 'Everyone's mute', he said. Doctors in the NHS must know this was not right, coming into work and injecting people. 'I don't know how they sleep at night. I know I couldn't do it. I know that if I were in that position I'd have to quit.' He said he knew enough about toxicology to know this was not a good risk-benefit. Yeadon had spoken to seven or eight university professors and all except two would not speak out publicly. Their universities had a policy that no one said anything that countered the government and its medical advisors. They were afraid of losing their government grants. This is how intimidation has been used to silence the truth at every level of the system. I say silence, but these people could still speak out if they made that choice. Yeadon called them 'moral cowards' – 'This is about your children and grandchildren's lives and you have just buggered off and left it.'

'Variant' nonsense

Some of his most powerful comments related to the alleged 'variants' being used to instil more fear, justify more lockdowns, and introduce more 'vaccines'. He said government claims about 'variants' were nonsense. He had checked the alleged variant 'codes' and they were 99.7 percent identical to the 'original'. This was the human identity difference equivalent to putting a baseball cap on and off or wearing it the other way round. A 0.3 percent difference would make it impossible for that 'variant' to escape immunity from the 'original'. This made no sense of having new 'vaccines' for

'variants'. He said there would have to be at least a *30 percent* difference for that to be justified and even then he believed the immune system would still recognise what it was. Gates-funded 'variant modeller' and 'vaccine'-pusher John Edmunds might care to comment. Yeadon said drug companies were making new versions of the 'vaccine' as a 'top up' for 'variants'. Worse than that, he said, the 'regulators' around the world like the MHRA in the UK had got together and agreed that because 'vaccines' for 'variants' were so similar to the first 'vaccines' *they did not have to do safety studies*. How transparently sinister that is. This is when Yeadon said: 'There is a conspiracy here.' There was no need for another vaccine for 'variants' and yet we were told that there was and the country had shut its borders because of them. 'They are going into hundreds of millions of arms without passing 'go' or any regulator. Why did they do that? Why did they pick this method of making the vaccine?'

The reason had to be something bigger than that it seemed and 'it's not protection against the virus'. It's was a far bigger project that meant politicians and advisers were willing to do things and not do things that knowingly resulted in avoidable deaths – 'that's already happened when you think about lockdown and deprivation of health care for a year.' He spoke of people prepared to do something that results in the avoidable death of their fellow human beings and it not bother them. This is the penny-drop I have been working to get across for more than 30 years – the level of pure evil we are dealing with. Yeadon said his friends and associates could not believe there could be that much evil, but he reminded them of Stalin, Pol Pot and Hitler and of what Stalin had said: 'One death is a tragedy. A million? A statistic.' He could not think of a benign explanation for why you need top-up vaccines 'which I'm sure you don't' and for the regulators 'to just get out of the way and wave them through'. Why would the regulators do that when they were still wrestling with the dangers of the 'parent' vaccine? He was clearly shocked by what he had seen since the 'Covid' hoax began and now he was thinking the previously unthinkable:

If you wanted to depopulate a significant proportion of the world and to do it in a way that doesn't involve destruction of the environment with nuclear weapons, poisoning everyone with anthrax or something like that, and you wanted plausible deniability while you had a multi-year infectious disease crisis, I actually don't think you could come up with a better plan of work than seems to be in front of me. I can't say that's what they are going to do, but I can't think of a benign explanation why they are doing it.

He said he never thought that they would get rid of 99 percent of humans, but now he wondered. 'If you wanted to that this would be a hell of a way to do it – it would be unstoppable folks.' Yeadon had concluded that those who submitted to the 'vaccine' would be allowed to have some kind of normal life (but for how long?) while screws were tightened to coerce and mandate the last few percent. 'I think they'll put the rest of them in a prison camp. I wish I was wrong, but I don't think I am.' Other points he made included: There were no coronavirus vaccines then suddenly they all come along at the same time; we have no idea of the long term affect with trials so short; coercing or forcing people to have medical procedures is against the Nuremberg Code instigated when the Nazis did just that; people should at least delay having the 'vaccine'; a quick Internet search confirms that masks don't reduce respiratory viral transmission and 'the government knows that'; they have smashed civil society and they know that, too; two dozen peer-reviewed studies show no connection between lockdown and reducing deaths; he knew from personal friends the elite were still flying around and going on holiday while the public were locked down; the elite were not having the 'vaccines'. He was also asked if 'vaccines' could be made to target difference races. He said he didn't know, but the document by the Project for the New American Century in September, 2000, said developing 'advanced forms of biological warfare that can target *specific genotypes* may transform biological warfare from the realm of terror to a politically useful tool.' Oh, they're evil all right. Of that we can be *absolutely* sure.

Another cull of old people

We have seen from the CDC definition that the mRNA 'Covid vaccine' is not a vaccine and nor are the others that *claim* to reduce 'severity of symptoms' in *some* people, but not protect from infection or transmission. What about all the lies about returning to 'normal' if people were 'vaccinated'? If they are not claimed to stop infection and transmission of the alleged 'virus', how does anything change? This was all lies to manipulate people to take the jabs and we are seeing that now with masks and distancing still required for the 'vaccinated'. How did they think that elderly people with fragile health and immune responses were going to be affected by infusing their cells with synthetic material and other toxic substances? They *knew* that in the short and long term it would be devastating and fatal as the culling of the old that began with the first lockdowns was continued with the 'vaccine'. Death rates in care homes soared immediately residents began to be 'vaccinated' – infused with synthetic material. Brave and committed whistleblower nurses put their careers at risk by exposing this truth while the rest kept their heads down and their mouths shut to put their careers before those they are supposed to care for. A long-time American Certified Nursing Assistant who gave his name as James posted a video in which he described emotionally what happened in his care home when vaccination began. He said that during 2020 very few residents were sick with 'Covid' and no one died during the entire year; but shortly after the Pfizer mRNA injections 14 people died within two weeks and many others were near death. 'They're dropping like flies', he said. Residents who walked on their own before the shot could no longer and they had lost their ability to conduct an intelligent conversation. The home's management said the sudden deaths were caused by a 'super-spreader' of 'Covid-19'. Then how come, James asked, that residents who refused to take the injections were not sick? It was a case of inject the elderly with mRNA synthetic potions and blame their illness and death that followed on the 'virus'. James described what was happening in care homes as 'the greatest crime of genocide this country has ever seen'. Remember the NHS staff nurse from earlier who used the same

word ‘genocide’ for what was happening with the ‘vaccines’ and that it was an ‘act of human annihilation’. A UK care home whistleblower told a similar story to James about the effect of the ‘vaccine’ in deaths and ‘outbreaks’ of illness dubbed ‘Covid’ after getting the jab. She told how her care home management and staff had zealously imposed government regulations and no one was allowed to even question the official narrative let alone speak out against it. She said the NHS was even worse. Again we see the results of reframing. A worker at a local care home where I live said they had not had a single case of ‘Covid’ there for almost a year and when the residents were ‘vaccinated’ they had 19 positive cases in two weeks with eight dying.

It’s not the ‘vaccine’ – honest

The obvious cause and effect was being ignored by the media and most of the public. Australia’s health minister Greg Hunt (a former head of strategy at the World Economic Forum) was admitted to hospital after he had the ‘vaccine’. He was suffering according to reports from the skin infection ‘cellulitis’ and it must have been a severe case to have warranted days in hospital. Immediately the authorities said this was nothing to do with the ‘vaccine’ when an effect of some vaccines is a ‘cellulitis-like reaction’. We had families of perfectly healthy old people who died after the ‘vaccine’ saying that if only they had been given the ‘vaccine’ earlier they would still be alive. As a numbskull rating that is off the chart. A father of four ‘died of Covid’ at aged 48 when he was taken ill two days after having the ‘vaccine’. The man, a health administrator, had been ‘shielding during the pandemic’ and had ‘not really left the house’ until he went for the ‘vaccine’. Having the ‘vaccine’ and then falling ill and dying does not seem to have qualified as a possible cause and effect and ‘Covid-19’ went on his death certificate. His family said they had no idea how he ‘caught the virus’. A family member said: ‘Tragically, it could be that going for a vaccination ultimately led to him catching Covid …The sad truth is that they are never going to know where it came from.’ The family warned people to remember

that the virus still existed and was 'very real'. So was their stupidity. Nurses and doctors who had the first round of the 'vaccine' were collapsing, dying and ending up in a hospital bed while they or their grieving relatives were saying they'd still have the 'vaccine' again despite what happened. I kid you not. You mean if your husband returned from the dead he'd have the same 'vaccine' again that killed him??

Doctors at the VCU Medical Center in Richmond, Virginia, said the Johnson & Johnson 'vaccine' was to blame for a man's skin peeling off. Patient Richard Terrell said: 'It all just happened so fast. My skin peeled off. It's still coming off on my hands now.' He said it was stinging, burning and itching and when he bent his arms and legs it was very painful with 'the skin swollen and rubbing against itself'. Pfizer/BioNTech and Moderna vaccines use mRNA to change the cell while the Johnson & Johnson version uses DNA in a process similar to AstraZeneca's technique. Johnson & Johnson and AstraZeneca have both had their 'vaccines' paused by many countries after causing serious blood problems. Terrell's doctor Fnu Nutan said he could have died if he hadn't got medical attention. It sounds terrible so what did Nutan and Terrell say about the 'vaccine' now? Oh, they still recommend that people have it. A nurse in a hospital bed 40 minutes after the vaccination and unable to swallow due to throat swelling was told by a doctor that he lost mobility in his arm for 36 hours following the vaccination. What did he say to the ailing nurse? 'Good for you for getting the vaccination.' We are dealing with a serious form of cognitive dissonance madness in both public and medical staff. There is a remarkable correlation between those having the 'vaccine' and trumpeting the fact and suffering bad happenings shortly afterwards. Witold Rogiewicz, a Polish doctor, made a video of his 'vaccination' and ridiculed those who were questioning its safety and the intentions of Bill Gates: 'Vaccinate yourself to protect yourself, your loved ones, friends and also patients. And to mention quickly I have info for anti-vaxxers and anti-Coviders if you want to contact Bill Gates you can do this through me.' He further ridiculed the dangers of 5G. Days later he

was dead, but naturally the vaccination wasn't mentioned in the verdict of 'heart attack'.

Lies, lies and more lies

So many members of the human race have slipped into extreme states of insanity and unfortunately they include reframed doctors and nursing staff. Having a 'vaccine' and dying within minutes or hours is not considered a valid connection while death from any cause within 28 days or longer of a positive test with a test not testing for the 'virus' means 'Covid-19' goes on the death certificate. How could that 'vaccine'-death connection not have been made except by calculated deceit? US figures in the initial rollout period to February 12th, 2020, revealed that a third of the deaths reported to the CDC after 'Covid vaccines' happened within 48 hours. Five men in the UK suffered an 'extremely rare' blood clot problem after having the AstraZeneca 'vaccine', but no causal link was established said the Gates-funded Medicines and Healthcare products Regulatory Agency (MHRA) which had given the 'vaccine' emergency approval to be used. Former Pfizer executive Dr Michael Yeadon explained in his interview how the procedures could cause blood coagulation and clots. People who should have been at no risk were dying from blood clots in the brain and he said he had heard from medical doctor friends that people were suffering from skin bleeding and massive headaches. The AstraZeneca 'shot' was stopped by some 20 countries over the blood clotting issue and still the corrupt MHRA, the European Medicines Agency (EMA) and the World Health Organization said that it should continue to be given even though the EMA admitted that it 'still cannot rule out definitively' a link between blood clotting and the 'vaccine'. Later Marco Cavaleri, head of EMA vaccine strategy, said there was indeed a clear link between the 'vaccine' and thrombosis, but they didn't know why. So much for the trials showing the 'vaccine' is safe. Blood clots were affecting younger people who would be under virtually no danger from 'Covid' even if it existed which makes it all the more stupid and sinister.

The British government responded to public alarm by wheeling out June Raine, the terrifyingly weak infant school headmistress sound-alike who heads the UK MHRA drug 'regulator'. The idea that she would stand up to Big Pharma and government pressure is laughable and she told us that all was well in the same way that she did when allowing untested, never-used-on-humans-before, genetically-manipulating 'vaccines' to be exposed to the public in the first place. Mass lying is the new normal of the 'Covid' era. The MHRA later said 30 cases of rare blood clots had by then been connected with the AstraZeneca 'vaccine' (that means a lot more in reality) while stressing that the benefits of the jab in preventing 'Covid-19' outweighed any risks. A more ridiculous and disingenuous statement with callous disregard for human health it is hard to contemplate. Immediately after the mendacious 'all-clears' two hospital workers in Denmark experienced blood clots and cerebral haemorrhaging following the AstraZeneca jab and one died. Top Norwegian health official Pål Andre Holme said the 'vaccine' was the only common factor: 'There is nothing in the patient history of these individuals that can give such a powerful immune response … I am confident that the antibodies that we have found are the cause, and I see no other explanation than it being the vaccine which triggers it.' Strokes, a clot or bleed in the brain, were clearly associated with the 'vaccine' from word of mouth and whistleblower reports. Similar consequences followed with all these 'vaccines' that we were told were so safe and as the numbers grew by the day it was clear we were witnessing human carnage.

Learning the hard way

A woman interviewed by UKColumn told how her husband suffered dramatic health effects after the vaccine when he'd been in good health all his life. He went from being a little unwell to losing all feeling in his legs and experiencing 'excruciating pain'. Misdiagnosis followed twice at Accident and Emergency (an 'allergy' and 'sciatica') before he was admitted to a neurology ward where doctors said his serious condition had been caused by the

'vaccine'. Another seven 'vaccinated' people were apparently being treated on the same ward for similar symptoms. The woman said he had the 'vaccine' because they believed media claims that it was safe. 'I didn't think the government would give out a vaccine that does this to somebody; I believed they would be bringing out a vaccination that would be safe.' What a tragic way to learn that lesson. Another woman posted that her husband was transporting stroke patients to hospital on almost every shift and when he asked them if they had been 'vaccinated' for 'Covid' they all replied 'yes'. One had a 'massive brain bleed' the day after his second dose. She said her husband reported the 'just been vaccinated' information every time to doctors in A and E only for them to ignore it, make no notes and appear annoyed that it was even mentioned. This particular report cannot be verified, but it expresses a common theme that confirms the monumental underreporting of 'vaccine' consequences. Interestingly as the 'vaccines' and their brain blood clot/stroke consequences began to emerge the UK National Health Service began a publicity campaign telling the public what to do in the event of a stroke. A Scottish NHS staff nurse who quit in disgust in March, 2021, said:

I have seen traumatic injuries from the vaccine, they're not getting reported to the yellow card [adverse reaction] scheme, they're treating the symptoms, not asking why, why it's happening. It's just treating the symptoms and when you speak about it you're dismissed like you're crazy, I'm not crazy, I'm not crazy because every other colleague I've spoken to is terrified to speak out, they've had enough.

Videos appeared on the Internet of people uncontrollably shaking after the 'vaccine' with no control over muscles, limbs and even their face. A Scottish mother broke out in a severe rash all over her body almost immediately after she was given the AstraZeneca 'vaccine'. The pictures were horrific. Leigh King, a 41-year-old hairdresser from Lanarkshire said: 'Never in my life was I prepared for what I was about to experience … My skin was so sore and constantly hot … I have never felt pain like this …' But don't you worry, the 'vaccine' is perfectly safe. Then there has been the effect on medical

staff who have been pressured to have the 'vaccine' by psychopathic 'health' authorities and government. A London hospital consultant who gave the name K. Polyakova wrote this to the *British Medical Journal* or *BMJ*:

> I am currently struggling with … the failure to report the reality of the morbidity caused by our current vaccination program within the health service and staff population. The levels of sickness after vaccination is unprecedented and staff are getting very sick and some with neurological symptoms which is having a huge impact on the health service function. Even the young and healthy are off for days, some for weeks, and some requiring medical treatment. Whole teams are being taken out as they went to get vaccinated together.
>
> Mandatory vaccination in this instance is stupid, unethical and irresponsible when it comes to protecting our staff and public health. We are in the voluntary phase of vaccination, and encouraging staff to take an unlicensed product that is impacting on their immediate health … it is clearly stated that these vaccine products do not offer immunity or stop transmission. In which case why are we doing it?

Not to protect health that's for sure. Medical workers are lauded by governments for agenda reasons when they couldn't give a toss about them any more than they can for the population in general. Schools across America faced the same situation as they closed due to the high number of teachers and other staff with bad reactions to the Pfizer/BioNTech, Moderna, and Johnson & Johnson 'Covid vaccines' all of which were linked to death and serious adverse effects. The *BMJ* took down the consultant's comments pretty quickly on the grounds that they were being used to spread 'disinformation'. They were exposing the truth about the 'vaccine' was the real reason. The cover-up is breathtaking.

Hiding the evidence

The scale of the 'vaccine' death cover-up worldwide can be confirmed by comparing official figures with the personal experience of the public. I heard of many people in my community who died immediately or soon after the vaccine that would never appear in the media or even likely on the official totals of 'vaccine' fatalities and adverse reactions when only about ten percent are estimated to be

reported and I have seen some estimates as low as one percent in a Harvard study. In the UK alone by April 29th, 2021, some 757,654 adverse reactions had been officially reported from the Pfizer/BioNTech, Oxford/AstraZeneca and Moderna 'vaccines' with more than a thousand deaths linked to jabs and that means an estimated ten times this number in reality from a ten percent reporting rate percentage. That's seven million adverse reactions and 10,000 potential deaths and a one percent reporting rate would be ten times *those* figures. In 1976 the US government pulled the swine flu vaccine after *53* deaths. The UK data included a combined 10,000 eye disorders from the 'Covid vaccines' with more than 750 suffering visual impairment or blindness and again multiply by the estimated reporting percentages. As 'Covid cases' officially fell hospitals virtually empty during the 'Covid crisis' began to fill up with a range of other problems in the wake of the 'vaccine' rollout. The numbers across America have also been catastrophic. Deaths linked to *all* types of vaccine increased by *6,000 percent* in the first quarter of 2021 compared with 2020. A 39-year-old woman from Ogden, Utah, died four days after receiving a second dose of Moderna's 'Covid vaccine' when her liver, heart and kidneys all failed despite the fact that she had no known medical issues or conditions. Her family sought an autopsy, but Dr Erik Christensen, Utah's chief medical examiner, said proving vaccine injury as a cause of death almost never happened. He could think of only one instance where an autopsy would name a vaccine as the official cause of death and that would be anaphylaxis where someone received a vaccine and died almost instantaneously. 'Short of that, it would be difficult for us to definitively say this is the vaccine,' Christensen said. If that is true this must be added to the estimated ten percent (or far less) reporting rate of vaccine deaths and serious reactions and the conclusion can only be that vaccine deaths and serious reactions – including these 'Covid' potions' – are phenomenally understated in official figures. The same story can be found everywhere. Endless accounts of deaths and serious reactions among the public, medical

and care home staff while official figures did not even begin to reflect this.

Professional script-reader Dr David Williams, a 'top public-health official' in Ontario, Canada, insulted our intelligence by claiming only four serious adverse reactions and no deaths from the more than 380,000 vaccine doses then given. This bore no resemblance to what people knew had happened in their owns circles and we had Dirk Huyer in charge of getting millions vaccinated in Ontario while at the same time he was Chief Coroner for the province investigating causes of death including possible death from the vaccine. An aide said he had stepped back from investigating deaths, but evidence indicated otherwise. Rosemary Frei, who secured a Master of Science degree in molecular biology at the Faculty of Medicine at Canada's University of Calgary before turning to investigative journalism, was one who could see that official figures for 'vaccine' deaths and reactions made no sense. She said that doctors seldom reported adverse events and when people got really sick or died after getting a vaccination they would attribute that to anything except the vaccines. It had been that way for years and anyone who wondered aloud whether the 'Covid vaccines' or other shots cause harm is immediately branded as 'anti-vax' and 'anti-science'. This was 'career-threatening' for health professionals. Then there was the huge pressure to support the push to 'vaccinate' billions in the quickest time possible. Frei said:

> So that's where we're at today. More than half a million vaccine doses have been given to people in Ontario alone. The rush is on to vaccinate all 15 million of us in the province by September. And the mainstream media are screaming for this to be sped up even more. That all adds up to only a very slim likelihood that we're going to be told the truth by officials about how many people are getting sick or dying from the vaccines.

What is true of Ontario is true of everywhere.

They KNEW – and still did it

The authorities knew what was going to happen with multiple deaths and adverse reactions. The UK government's Gates-funded

and Big Pharma-dominated Medicines and Healthcare products Regulatory Agency (MHRA) hired a company to employ AI in compiling the projected reactions to the 'vaccine' that would otherwise be uncountable. The request for applications said: 'The MHRA urgently seeks an Artificial Intelligence (AI) software tool to process the expected high volume of Covid-19 vaccine Adverse Drug Reaction …' This was from the agency, headed by the disingenuous June Raine, that gave the 'vaccines' emergency approval and the company was hired before the first shot was given. 'We are going to kill and maim you – is that okay?' 'Oh, yes, perfectly fine – I'm very grateful, thank you, doctor.' The range of 'Covid vaccine' adverse reactions goes on for page after page in the MHRA criminally underreported 'Yellow Card' system and includes affects to eyes, ears, skin, digestion, blood and so on. Raine's MHRA amazingly claimed that the 'overall safety experience … is so far as expected from the clinical trials'. The death, serious adverse effects, deafness and blindness were *expected?* When did they ever mention that? If these human tragedies were expected then those that gave approval for the use of these 'vaccines' must be guilty of crimes against humanity including murder – a definition of which is 'killing a person with malice aforethought or with recklessness manifesting extreme indifference to the value of human life.' People involved at the MHRA, the CDC in America and their equivalent around the world must go before Nuremberg trials to answer for their callous inhumanity. We are only talking here about the immediate effects of the 'vaccine'. The longer-term impact of the DNA synthetic manipulation is the main reason they are so hysterically desperate to inoculate the entire global population in the shortest possible time.

Africa and the developing world are a major focus for the 'vaccine' depopulation agenda and a mass vaccination sales-pitch is underway thanks to caring people like the Rockefellers and other Cult assets. The Rockefeller Foundation, which pre-empted the 'Covid pandemic' in a document published in 2010 that 'predicted' what happened a decade later, announced an initial $34.95 million grant in February, 2021, 'to ensure more equitable access to Covid-19

testing and vaccines' among other things in Africa in collaboration with '24 organizations, businesses, and government agencies'. The pan-Africa initiative would focus on 10 countries: Burkina Faso, Ethiopia, Ghana, Kenya, Nigeria, Rwanda, South Africa, Tanzania, Uganda, and Zambia'. Rajiv Shah, President of the Rockefeller Foundation and former administrator of CIA-controlled USAID, said that if Africa was not mass-vaccinated (to change the DNA of its people) it was a 'threat to all of humanity' and not fair on Africans. When someone from the Rockefeller Foundation says they want to do something to help poor and deprived people and countries it is time for a belly-laugh. They are doing this out of the goodness of their 'heart' because 'vaccinating' the entire global population is what the 'Covid' hoax set out to achieve. Official 'decolonisation' of Africa by the Cult was merely a prelude to financial colonisation on the road to a return to physical colonisation. The 'vaccine' is vital to that and the sudden and convenient death of the 'Covid' sceptic president of Tanzania can be seen in its true light. A lot of people in Africa are aware that this is another form of colonisation and exploitation and they need to stand their ground.

The 'vaccine is working' scam

A potential problem for the Cult was that the 'vaccine' is meant to change human DNA and body messaging and not to protect anyone from a 'virus' never shown to exist. The vaccine couldn't work because it was not designed to work and how could they make it *appear* to be working so that more people would have it? This was overcome by lowering the amplification rate of the PCR test to produce fewer 'cases' and therefore fewer 'deaths'. Some of us had been pointing out since March, 2020, that the amplification rate of the test not testing for the 'virus' had been made artificially high to generate positive tests which they could call 'cases' to justify lockdowns. The World Health Organization recommended an absurdly high 45 amplification cycles to ensure the high positives required by the Cult and then remained silent on the issue until January 20th, 2021 – Biden's Inauguration Day. This was when the

'vaccinations' were seriously underway and on that day the WHO recommended after discussions with America's CDC that laboratories *lowered their testing amplification*. Dr David Samadi, a certified urologist and health writer, said the WHO was encouraging all labs to reduce their cycle count for PCR tests. He said the current cycle was much too high and was 'resulting in any particle being declared a positive case'. Even one mainstream news report I saw said this meant the number of 'Covid' infections may have been 'dramatically inflated'. Oh, just a little bit. The CDC in America issued new guidance to laboratories in April, 2021, to use 28 cycles *but only for 'vaccinated' people*. The timing of the CDC/WHO interventions were cynically designed to make it appear the 'vaccines' were responsible for falling cases and deaths when the real reason can be seen in the following examples. New York's state lab, the Wadsworth Center, identified 872 positive tests in July, 2020, based on a threshold of 40 cycles. When the figure was lowered to 35 cycles *43 percent* of the 872 were no longer 'positives'. At 30 cycles the figure was 63 percent. A Massachusetts lab found that between *85 to 90 percent* of people who tested positive in July with a cycle threshold of 40 would be negative at 30 cycles, Ashish Jha, MD, director of the Harvard Global Health Institute, said: 'I'm really shocked that it could be that high … Boy, does it really change the way we need to be thinking about testing.' I'm shocked that I could see the obvious in the spring of 2020, with no medical background, and most medical professionals still haven't worked it out. No, that's not shocking – it's terrifying.

Three weeks after the WHO directive to lower PCR cycles the London *Daily Mail* ran this headline: 'Why ARE Covid cases plummeting? New infections have fallen 45% in the US and 30% globally in the past 3 weeks but experts say vaccine is NOT the main driver because only 8% of Americans and 13% of people worldwide have received their first dose.' They acknowledged that the drop could not be attributed to the 'vaccine', but soon this morphed throughout the media into the 'vaccine' has caused cases and deaths to fall when it was the PCR threshold. In December, 2020, there was

chaos at English Channel ports with truck drivers needing negative 'Covid' tests before they could board a ferry home for Christmas. The government wanted to remove the backlog as fast as possible and they brought in troops to do the 'testing'. Out of 1,600 drivers just *36* tested positive and the rest were given the all clear to cross the Channel. I guess the authorities thought that 36 was the least they could get away with without the unquestioning catching on. The amplification trick which most people believed in the absence of information in the mainstream applied more pressure on those refusing the 'vaccine' to succumb when it 'obviously worked'. The truth was the exact opposite with deaths in care homes soaring with the 'vaccine' and in Israel the term used was 'skyrocket'. A re-analysis of published data from the Israeli Health Ministry led by Dr Hervé Seligmann at the Medicine Emerging Infectious and Tropical Diseases at Aix-Marseille University found that Pfizer's 'Covid vaccine' killed 'about 40 times more [elderly] people than the disease itself would have killed' during a five-week vaccination period and *260 times* more younger people than would have died from the 'virus' even according to the manipulated 'virus' figures. Dr Seligmann and his co-study author, Haim Yativ, declared after reviewing the Israeli 'vaccine' death data: 'This is a new Holocaust.'

Then, in mid-April, 2021, after vast numbers of people worldwide had been 'vaccinated', the story changed with clear coordination. The UK government began to prepare the ground for more future lockdowns when Nuremberg-destined Boris Johnson told yet another whopper. He said that cases had fallen because of *lockdowns* not 'vaccines'. Lockdowns are irrelevant when *there is no 'virus'* and the test and fraudulent death certificates are deciding the number of 'cases' and 'deaths'. Study after study has shown that lockdowns don't work and instead kill and psychologically destroy people. Meanwhile in the United States Anthony Fauci and Rochelle Walensky, the ultra-Zionist head of the CDC, peddled the same line. More lockdown was the answer and not the 'vaccine', a line repeated on cue by the moron that is Canadian Prime Minister Justin Trudeau. Why all the hysteria to get everyone 'vaccinated' if lockdowns and

not 'vaccines' made the difference? None of it makes sense on the face of it. Oh, but it does. The Cult wants lockdowns *and* the 'vaccine' and if the 'vaccine' is allowed to be seen as the total answer lockdowns would no longer be justified when there are still livelihoods to destroy. 'Variants' and renewed upward manipulation of PCR amplification are planned to instigate never-ending lockdown *and* more 'vaccines'.

You *must* have it – we're desperate

Israel, where the Jewish and Arab population are ruled by the Sabbatian Cult, was the front-runner in imposing the DNA-manipulating 'vaccine' on its people to such an extent that Jewish refusers began to liken what was happening to the early years of Nazi Germany. This would seem to be a fantastic claim. Why would a government of Jewish people be acting like the Nazis did? If you realise that the Sabbatian Cult was behind the Nazis and that Sabbatians hate Jews the pieces start to fit and the question of why a 'Jewish' government would treat Jews with such callous disregard for their lives and freedom finds an answer. Those controlling the government of Israel *aren't Jewish* – they're Sabbatian. Israeli lawyer Tamir Turgal was one who made the Nazi comparison in comments to German lawyer Reiner Fuellmich who is leading a class action lawsuit against the psychopaths for crimes against humanity. Turgal described how the Israeli government was vaccinating children and pregnant women on the basis that there was no evidence that this was dangerous when they had no evidence that it *wasn't* dangerous either. They just had no evidence. This was medical experimentation and Turgal said this breached the Nuremberg Code about medical experimentation and procedures requiring informed consent and choice. Think about that. A Nuremberg Code developed because of Nazi experimentation on Jews and others in concentration camps by people like the evil-beyond-belief Josef Mengele is being breached by the *Israeli* government; but when you know that it's a *Sabbatian* government along with its intelligence and military agencies like Mossad, Shin Bet and the Israeli Defense Forces, and that Sabbatians

were the force behind the Nazis, the kaleidoscope comes into focus. What have we come to when Israeli Jews are suing their government for violating the Nuremberg Code by essentially making Israelis subject to a medical experiment using the controversial 'vaccines'? It's a shocker that this has to be done in the light of what happened in Nazi Germany. The Anshe Ha-Emet, or 'People of the Truth', made up of Israeli doctors, lawyers, campaigners and public, have launched a lawsuit with the International Criminal Court. It says:

> When the heads of the Ministry of Health as well as the prime minister presented the vaccine in Israel and began the vaccination of Israeli residents, the vaccinated were not advised, that, in practice, they are taking part in a medical experiment and that their consent is required for this under the Nuremberg Code.

The irony is unbelievable, but easily explained in one word: Sabbatians. The foundation of Israeli 'Covid' apartheid is the 'green pass' or 'green passport' which allows Jews and Arabs who have had the DNA-manipulating 'vaccine' to go about their lives – to work, fly, travel in general, go to shopping malls, bars, restaurants, hotels, concerts, gyms, swimming pools, theatres and sports venues, while non-'vaccinated' are banned from all those places and activities. Israelis have likened the 'green pass' to the yellow stars that Jews in Nazi Germany were forced to wear – the same as the yellow stickers that a branch of UK supermarket chain Morrisons told exempt mask-wears they had to display when shopping. How very sensitive. The Israeli system is blatant South African-style apartheid on the basis of compliance or non-compliance to fascism rather than colour of the skin. How appropriate that the Sabbatian Israeli government was so close to the pre-Mandela apartheid regime in Pretoria. The Sabbatian-instigated 'vaccine passport' in Israel is planned for everywhere. Sabbatians struck a deal with Pfizer that allowed them to lead the way in the percentage of a national population infused with synthetic material and the result was catastrophic. Israeli freedom activist Shai Dannon told me how chairs were appearing on beaches that said 'vaccinated only'. Health Minister Yuli Edelstein said that anyone unwilling or unable to get

the jabs that 'confer immunity' will be 'left behind'. The man's a liar. Not even the makers claim the 'vaccines' confer immunity. When you see those figures of 'vaccine' deaths these psychopaths were saying that you must take the chance the 'vaccine' will kill you or maim you while knowing it will change your DNA or lockdown for you will be permanent. That's fascism. The Israeli parliament passed a law to allow personal information of the non-vaccinated to be shared with local and national authorities for three months. This was claimed by its supporters to be a way to 'encourage' people to be vaccinated. Hadas Ziv from Physicians for Human Rights described this as a 'draconian law which crushed medical ethics and the patient rights'. But that's the idea, the Sabbatians would reply.

Your papers, please

Sabbatian Israel was leading what has been planned all along to be a global 'vaccine pass' called a 'green passport' without which you would remain in permanent lockdown restriction and unable to do anything. This is how badly – *desperately* – the Cult is to get everyone 'vaccinated'. The term and colour 'green' was not by chance and related to the psychology of fusing the perception of the green climate hoax with the 'Covid' hoax and how the 'solution' to both is the same Great Reset. Lying politicians, health officials and psychologists denied there were any plans for mandatory vaccinations or restrictions based on vaccinations, but they knew that was exactly what was meant to happen with governments of all countries reaching agreements to enforce a global system. 'Free' Denmark and 'free' Sweden unveiled digital vaccine certification. Cyprus, Czech Republic, Estonia, Greece, Hungary, Iceland, Italy, Poland, Portugal, Slovakia, and Spain have all committed to a vaccine passport system and the rest including the whole of the EU would follow. The satanic UK government will certainly go this way despite mendacious denials and at the time of writing it is trying to manipulate the public into having the 'vaccine' so they could go abroad on a summer holiday. How would that work without something to prove you had the synthetic toxicity injected into you?

Documents show that the EU's European Commission was moving towards 'vaccine certificates' in 2018 and 2019 before the 'Covid' hoax began. They knew what was coming. Abracadabra – Ursula von der Leyen, the German President of the Commission, announced in March, 2021, an EU 'Digital Green Certificate' – green again – to track the public's 'Covid status'. The passport sting is worldwide and the Far East followed the same pattern with South Korea ruling that only those with 'vaccination' passports – again the *green* pass – would be able to 'return to their daily lives'.

Bill Gates has been preparing for this 'passport' with other Cult operatives for years and beyond the paper version is a Gates-funded 'digital tattoo' to identify who has been vaccinated and who hasn't. The 'tattoo' is reported to include a substance which is externally readable to confirm who has been vaccinated. This is a bio-luminous light-generating enzyme (think fireflies) called … *Luciferase*. Yes, named after the Cult 'god' Lucifer the 'light bringer' of whom more to come. Gates said he funded the readable tattoo to ensure children in the developing world were vaccinated and no one was missed out. He cares so much about poor kids as we know. This was just the cover story to develop a vaccine tagging system for everyone on the planet. Gates has been funding the ID2020 'alliance' to do just that in league with other lovely people at Microsoft, GAVI, the Rockefeller Foundation, Accenture and IDEO.org. He said in interviews in March, 2020, before any 'vaccine' publicly existed, that the world must have a globalised digital certificate to track the 'virus' and who had been vaccinated. Gates knew from the start that the mRNA vaccines were coming and when they would come and that the plan was to tag the 'vaccinated' to marginalise the intelligent and stop them doing anything including travel. Evil just doesn't suffice. Gates was exposed for offering a $10 million bribe to the Nigerian House of Representatives to invoke compulsory 'Covid' vaccination of all Nigerians. Sara Cunial, a member of the Italian Parliament, called Gates a 'vaccine criminal'. She urged the Italian President to hand him over to the International Criminal Court for crimes against

humanity and condemned his plans to 'chip the human race' through ID2020.

You know it's a long-planned agenda when war criminal and Cult gofer Tony Blair is on the case. With the scale of arrogance only someone as dark as Blair can muster he said: 'Vaccination in the end is going to be your route to liberty.' Blair is a disgusting piece of work and he confirms that again. The media has given a lot of coverage to a bloke called Charlie Mullins, founder of London's biggest independent plumbing company, Pimlico Plumbers, who has said he won't employ anyone who has not been vaccinated or have them go to any home where people are not vaccinated. He said that if he had his way no one would be allowed to walk the streets if they have not been vaccinated. Gates was cheering at the time while I was alerting the white coats. The plan is that people will qualify for 'passports' for having the first two doses and then to keep it they will have to have all the follow ups and new ones for invented 'variants' until human genetics is transformed and many are dead who can't adjust to the changes. Hollywood celebrities – the usual propaganda stunt – are promoting something called the WELL Health-Safety Rating to verify that a building or space has 'taken the necessary steps to prioritize the health and safety of their staff, visitors and other stakeholders'. They included Lady Gaga, Jennifer Lopez, Michael B. Jordan, Robert DeNiro, Venus Williams, Wolfgang Puck, Deepak Chopra and 17th Surgeon General Richard Carmona. Yawn. WELL Health-Safety has big connections with China. Parent company Delos is headed by former Goldman Sachs partner Paul Scialla. This is another example – and we will see so many others – of using the excuse of 'health' to dictate the lives and activities of the population. I guess one confirmation of the 'safety' of buildings is that only 'vaccinated' people can go in, right?

Electronic concentration camps

I wrote decades ago about the plans to restrict travel and here we are for those who refuse to bow to tyranny. This can be achieved in one go with air travel if the aviation industry makes a blanket decree.

The ‘vaccine’ and guaranteed income are designed to be part of a global version of China’s social credit system which tracks behaviour 24/7 and awards or deletes ‘credits’ based on whether your behaviour is supported by the state or not. I mean your entire lifestyle – what you do, eat, say, everything. Once your credit score falls below a certain level consequences kick in. In China tens of millions have been denied travel by air and train because of this. All the locations and activities denied to refusers by the ‘vaccine’ passports will be included in one big mass ban on doing almost anything for those that don’t bow their head to government. It’s beyond fascist and a new term is required to describe its extremes – I guess fascist technocracy will have to do. The way the Chinese system of technological – technocratic – control is sweeping the West can be seen in the Los Angeles school system and is planned to be expanded worldwide. Every child is required to have a ‘Covid’-tracking app scanned daily before they can enter the classroom. The so-called Daily Pass tracking system is produced by Gates’ Microsoft which I’m sure will shock you rigid. The pass will be scanned using a barcode (one step from an inside-the-body barcode) and the information will include health checks, ‘Covid’ tests and vaccinations. Entry codes are for one specific building only and access will only be allowed if a student or teacher has a negative test with a test not testing for the ‘virus’, has no symptoms of anything alleged to be related to ‘Covid’ (symptoms from a range of other illness), and has a temperature under 100 degrees. No barcode, no entry, is planned to be the case for everywhere and not only schools.

Kids are being psychologically prepared to accept this as ‘normal’ their whole life which is why what they can impose in schools is so important to the Cult and its gofers. Long-time American freedom campaigner John Whitehead of the Rutherford Institute was not exaggerating when he said: ‘Databit by databit, we are building our own electronic concentration camps.’ Canada under its Cult gofer prime minister Justin Trudeau has taken a major step towards the real thing with people interned against their will if they test positive with a test not testing for the ‘virus’ when they arrive at a Canadian

airport. They are jailed in internment hotels often without food or water for long periods and with many doors failing to lock there have been sexual assaults. The interned are being charged sometimes $2,000 for the privilege of being abused in this way. Trudeau is fully on board with the Cult and says the 'Covid pandemic' has provided an opportunity for a global 'reset' to permanently change Western civilisation. His number two, Deputy Prime Minister Chrystia Freeland, is a trustee of the World Economic Forum and a Rhodes Scholar. The Trudeau family have long been servants of the Cult. See *The Biggest Secret* and Cathy O'Brien's book *Trance-Formation of America* for the horrific background to Trudeau's father Pierre Trudeau another Canadian prime minister. Hide your fascism behind the façade of a heart-on-the-sleeve liberal. It's a well-honed Cult technique.

What can the 'vaccine' *really* do?

We have a 'virus' never shown to exist and 'variants' of the 'virus' that have also never been shown to exist except, like the 'original', as computer-generated fictions. Even if you believe there's a 'virus' the 'case' to 'death' rate is in the region of 0.23 to 0.15 percent and those 'deaths' are concentrated among the very old around the same average age that people die anyway. In response to this lack of threat (in truth none) psychopaths and idiots, knowingly and unknowingly answering to Gates and the Cult, are seeking to 'vaccinate' every man, woman and child on Planet Earth. Clearly the 'vaccine' is not about 'Covid' – none of this ever has been. So what is it all about *really*? Why the desperation to infuse genetically-manipulating synthetic material into everyone through mRNA fraudulent 'vaccines' with the intent of doing this over and over with the excuses of 'variants' and other 'virus' inventions? Dr Sherri Tenpenny, an osteopathic medical doctor in the United States, has made herself an expert on vaccines and their effects as a vehement campaigner against their use. Tenpenny was board certified in emergency medicine, the director of a level two trauma centre for 12 years, and moved to Cleveland in 1996 to start an integrative

medicine practice which has treated patients from all 50 states and some 17 other countries. Weaning people off pharmaceutical drugs is a speciality.

She became interested in the consequences of vaccines after attending a meeting at the National Vaccine Information Center in Washington DC in 2000 where she 'sat through four days of listening to medical doctors and scientists and lawyers and parents of vaccine injured kids' and asked: 'What's going on?' She had never been vaccinated and never got ill while her father was given a list of vaccines to be in the military and was 'sick his entire life'. The experience added to her questions and she began to examine vaccine documents from the Centers for Disease Control (CDC). After reading the first one, the 1998 version of *The General Recommendations of Vaccination*, she thought: 'This is it?' The document was poorly written and bad science and Tenpenny began 20 years of research into vaccines that continues to this day. She began her research into 'Covid vaccines' in March, 2020, and she describes them as 'deadly'. For many, as we have seen, they already have been. Tenpenny said that in the first 30 days of the 'vaccine' rollout in the United States there had been more than 40,000 adverse events reported to the vaccine adverse event database. A document had been delivered to her the day before that was 172 pages long. 'We have over 40,000 adverse events; we have over 3,100 cases of [potentially deadly] anaphylactic shock; we have over 5,000 neurological reactions.' Effects ranged from headaches to numbness, dizziness and vertigo, to losing feeling in hands or feet and paraesthesia which is when limbs 'fall asleep' and people have the sensation of insects crawling underneath their skin. All this happened in the first 30 days and remember that only about *ten percent* (or far less) of adverse reactions and vaccine-related deaths are estimated to be officially reported. Tenpenny said:

> So can you think of one single product in any industry, any industry, for as long as products have been made on the planet that within 30 days we have 40,000 people complaining of side effects that not only is still on the market but … we've got paid actors telling us how great

they are for getting their vaccine. We're offering people $500 if they will just get their vaccine and we've got nurses and doctors going; 'I got the vaccine, I got the vaccine'.

Tenpenny said they were not going to be 'happy dancing folks' when they began to suffer Bell's palsy (facial paralysis), neuropathies, cardiac arrhythmias and autoimmune reactions that kill through a blood disorder. 'They're not going to be so happy, happy then, but we're never going to see pictures of those people' she said. Tenpenny described the 'vaccine' as 'a well-designed killing tool'.

No off-switch

Bad as the initial consequences had been Tenpenny said it would be maybe 14 months before we began to see the 'full ravage' of what is going to happen to the 'Covid vaccinated' with full-out consequences taking anything between two years and 20 years to show. You can understand why when you consider that variations of the 'Covid vaccine' use mRNA (messenger RNA) to in theory activate the immune system to produce protective antibodies without using the actual 'virus'. How can they when it's a computer program and they've never isolated what they claim is the 'real thing'? Instead they use *synthetic* mRNA. They are inoculating synthetic material into the body which through a technique known as the Trojan horse is absorbed into cells to change the nature of DNA. Human DNA is changed by an infusion of messenger RNA and with each new 'vaccine' of this type it is changed even more. Say so and you are banned by Cult Internet platforms. The contempt the contemptuous Mark Zuckerberg has for the truth and human health can be seen in an internal Facebook video leaked to the Project Veritas investigative team in which he said of the 'Covid vaccines': '… I share some caution on this because we just don't know the long term side-effects of basically modifying people's DNA and RNA.' At the same time this disgusting man's Facebook was censoring and banning anyone saying exactly the same. He must go before a Nuremberg trial for crimes against humanity when he *knows* that he

is censoring legitimate concerns and denying the right of informed consent on behalf of the Cult that owns him. People have been killed and damaged by the very 'vaccination' technique he cast doubt on himself when they may not have had the 'vaccine' with access to information that he denied them. The plan is to have at least annual 'Covid vaccinations', add others to deal with invented 'variants', and change all other vaccines into the mRNA system. Pfizer executives told shareholders at a virtual Barclays Global Healthcare Conference in March, 2021, that the public may need a third dose of 'Covid vaccine', plus regular yearly boosters and the company planned to hike prices to milk the profits in a 'significant opportunity for our vaccine'. These are the professional liars, cheats and opportunists who are telling you their 'vaccine' is safe. Given this volume of mRNA planned to be infused into the human body and its ability to then replicate we will have a transformation of human genetics from biological to synthetic biological – exactly the long-time Cult plan for reasons we'll see – and many will die. Sherri Tenpenny said of this replication:

> It's like having an on-button but no off-button and that whole mechanism … they actually give it a name and they call it the Trojan horse mechanism, because it allows that [synthetic] virus and that piece of that [synthetic] virus to get inside of your cells, start to replicate and even get inserted into other parts of your DNA as a Trojan-horse.

Ask the overwhelming majority of people who have the 'vaccine' what they know about the contents and what they do and they would reply: 'The government says it will stop me getting the virus.' Governments give that false impression on purpose to increase take-up. You can read Sherri Tenpenny's detailed analysis of the health consequences in her blog at Vaxxter.com, but in summary these are some of them. She highlights the statement by Bill Gates about how human beings can become their own 'vaccine manufacturing machine'. The man is insane. ['Vaccine'-generated] 'antibodies' carry synthetic messenger RNA into the cells and the damage starts, Tenpenny contends, and she says that lungs can be adversely affected through varying degrees of pus and bleeding which

obviously affects breathing and would be dubbed 'Covid-19'. Even more sinister was the impact of 'antibodies' on macrophages, a white blood cell of the immune system. They consist of Type 1 and Type 2 which have very different functions. She said Type 1 are 'hyper-vigilant' white blood cells which 'gobble up' bacteria etc. However, in doing so, this could cause inflammation and in extreme circumstances be fatal. She says these affects are mitigated by Type 2 macrophages which kick in to calm down the system and stop it going rogue. They clear up dead tissue debris and reduce inflammation that the Type 1 'fire crews' have caused. Type 1 kills the infection and Type 2 heals the damage, she says. This is her punchline with regard to 'Covid vaccinations': She says that mRNA 'antibodies' block Type 2 macrophages by attaching to them and deactivating them. This meant that when the Type 1 response was triggered by infection there was nothing to stop that getting out of hand by calming everything down. There's an on-switch, but no off-switch, she says. What follows can be 'over and out, see you when I see you'.

Genetic suicide

Tenpenny also highlights the potential for autoimmune disease – the body attacking itself – which has been associated with vaccines since they first appeared. Infusing a synthetic foreign substance into cells could cause the immune system to react in a panic believing that the body is being overwhelmed by an invader (it is) and the consequences can again be fatal. There is an autoimmune response known as a 'cytokine storm' which I have likened to a homeowner panicked by an intruder and picking up a gun to shoot randomly in all directions before turning the fire on himself. The immune system unleashes a storm of inflammatory response called cytokines to a threat and the body commits hara-kiri. The lesson is that you mess with the body's immune response at your peril and these 'vaccines' seriously – fundamentally – mess with immune response. Tenpenny refers to a consequence called anaphylactic shock which is a severe and highly dangerous allergic reaction when the immune system

floods the body with chemicals. She gives the example of having a bee sting which primes the immune system and makes it sensitive to those chemicals. When people are stung again maybe years later the immune response can be so powerful that it leads to anaphylactic shock. Tenpenny relates this 'shock' with regard to the 'Covid vaccine' to something called polyethylene glycol or PEG. Enormous numbers of people have become sensitive to this over decades of use in a whole range of products and processes including food, drink, skin creams and 'medicine'. Studies have claimed that some 72 percent of people have antibodies triggered by PEG compared with two percent in the 1960s and allergic hypersensitive reactions to this become a gathering cause for concern. Tenpenny points out that the 'mRNA vaccine' is coated in a 'bubble' of polyethylene glycol which has the potential to cause anaphylactic shock through immune sensitivity. Many reports have appeared of people reacting this way after having the 'Covid vaccine'. What do we think is going to happen as humanity has more and more of these 'vaccines'? Tenpenny said: 'All these pictures we have seen with people with these rashes … these weepy rashes, big reactions on their arms and things like that – it's an acute allergic reaction most likely to the polyethylene glycol that you've been previously primed and sensitised to.'

Those who have not studied the conspiracy and its perpetrators at length might think that making the population sensitive to PEG and then putting it in these 'vaccines' is just a coincidence. It is not. It is instead testament to how carefully and coldly-planned current events have been and the scale of the conspiracy we are dealing with. Tenpenny further explains that the 'vaccine' mRNA procedure can breach the blood-brain barrier which protects the brain from toxins and other crap that will cause malfunction. In this case they could make two proteins corrupt brain function to cause Amyotrophic lateral sclerosis (ALS) , a progressive nervous system disease leading to loss of muscle control, and frontal lobe degeneration – Alzheimer's and dementia. Immunologist J. Bart Classon published a paper connecting mRNA 'vaccines' to prion

disease which can lead to Alzheimer's and other forms of neurogenerative disease while others have pointed out the potential to affect the placenta in ways that make women infertile. This will become highly significant in the next chapter when I will discuss other aspects of this non-vaccine that relate to its nanotechnology and transmission from the injected to the uninjected.

Qualified in idiocy

Tenpenny describes how research has confirmed that these 'vaccine'-generated antibodies can interact with a range of other tissues in the body and attack many other organs including the lungs. 'This means that if you have a hundred people standing in front of you that all got this shot they could have a hundred different symptoms.' Anyone really think that Cult gofers like the Queen, Tony Blair, Christopher Whitty, Anthony Fauci, and all the other psychopaths have really had this 'vaccine' in the pictures we've seen? Not a bloody chance. Why don't doctors all tell us about all these dangers and consequences of the 'Covid vaccine'? Why instead do they encourage and pressure patients to have the shot? Don't let's think for a moment that doctors and medical staff can't be stupid, lazy, and psychopathic and that's without the financial incentives to give the jab. Tenpenny again:

> Some people are going to die from the vaccine directly but a large number of people are going to start to get horribly sick and get all kinds of autoimmune diseases 42 days to maybe a year out. What are they going to do, these stupid doctors who say; 'Good for you for getting that vaccine.' What are they going to say; 'Oh, it must be a mutant, we need to give an extra dose of that vaccine.'
>
> Because now the vaccine, instead of one dose or two doses we need three or four because the stupid physicians aren't taking the time to learn anything about it. If I can learn this sitting in my living room reading a 19 page paper and several others so can they. There's nothing special about me, I just take the time to do it.

Remember how Sara Kayat, the NHS and TV doctor, said that the 'Covid vaccine' would '100 percent prevent hospitalisation and death'. Doctors can be idiots like every other profession and they

should not be worshipped as infallible. They are not and far from it. Behind many medical and scientific 'experts' lies an uninformed prat trying to hide themselves from you although in the 'Covid' era many have failed to do so as with UK narrative-repeating 'TV doctor' Hilary Jones. Pushing back against the minority of proper doctors and scientists speaking out against the 'vaccine' has been the entire edifice of the Cult global state in the form of governments, medical systems, corporations, mainstream media, Silicon Valley, and an army of compliant doctors, medical staff and scientists willing to say anything for money and to enhance their careers by promoting the party line. If you do that you are an 'expert' and if you won't you are an 'anti-vaxxer' and 'Covidiot'. The pressure to be 'vaccinated' is incessant. We have even had reports claiming that the 'vaccine' can help cure cancer and Alzheimer's and make the lame walk. I am waiting for the announcement that it can bring you coffee in the morning and cook your tea. Just as the symptoms of 'Covid' seem to increase by the week so have the miracles of the 'vaccine'. American supermarket giant Kroger Co. offered nearly 500,000 employees in 35 states a $100 bonus for having the 'vaccine' while donut chain Krispy Kreme promised 'vaccinated' customers a free glazed donut every day for the rest of 2021. Have your DNA changed and you will get a doughnut although we might not have to give you them for long. Such offers and incentives confirm the desperation.

Perhaps the worse vaccine-stunt of them all was UK 'Health' Secretary Matt-the-prat Hancock on live TV after watching a clip of someone being 'vaccinated' when the roll-out began. Hancock faked tears so badly it was embarrassing. Brain-of-Britain Piers Morgan, the lockdown-supporting, 'vaccine' supporting, 'vaccine' passport-supporting, TV host played along with Hancock – 'You're quite emotional about that' he said in response to acting so atrocious it would have been called out at a school nativity which will presumably today include Mary and Jesus in masks, wise men keeping their camels six feet apart, and shepherds under tent arrest. System-serving Morgan tweeted this: 'Love the idea of covid vaccine passports for everywhere: flights, restaurants, clubs, football, gyms,

shops etc. It's time covid-denying, anti-vaxxer loonies had their bullsh*t bluff called & bar themselves from going anywhere that responsible citizens go.' If only I could aspire to his genius. To think that Morgan, who specialises in shouting over anyone he disagrees with, was lauded as a free speech hero when he lost his job after storming off the set of his live show like a child throwing his dolly out of the pram. If he is a free speech hero we are in real trouble. I have no idea what 'bullsh*t' means, by the way, the * throws me completely.

The Cult is desperate to infuse its synthetic DNA-changing concoction into everyone and has been using every lie, trick and intimidation to do so. The question of '*Why*?' we shall now address.

CHAPTER TEN

Human 2.0

I believe that at the end of the century the use of words and general educated opinion will have altered so much that one will be able to speak of machines thinking without expecting to be contradicted –
Alan Turing (1912-1954), the 'Father of artificial intelligence'

I have been exposing for decades the plan to transform the human body from a biological to a synthetic-biological state. The new human that I will call Human 2.0 is planned to be connected to artificial intelligence and a global AI 'Smart Grid' that would operate as one global system in which AI would control everything from your fridge to your heating system to your car to your mind. Humans would no longer be 'human', but post-human and sub-human, with their thinking and emotional processes replaced by AI.

What I said sounded crazy and beyond science fiction and I could understand that. To any balanced, rational, mind it *is* crazy. Today, however, that world is becoming reality and it puts the 'Covid vaccine' into its true context. Ray Kurzweil is the ultra-Zionist 'computer scientist, inventor and futurist' and co-founder of the Singularity University. Singularity refers to the merging of humans with machines or 'transhumanism'. Kurzweil has said humanity would be connected to the cyber 'cloud' in the period of the ever-recurring year of 2030:

Our thinking … will be a hybrid of biological and non-biological thinking … humans will be able to extend their limitations and 'think in the cloud' … We're going to put gateways to the

cloud in our brains ... We're going to gradually merge and enhance ourselves ... In my view, that's the nature of being human – we transcend our limitations. As the technology becomes vastly superior to what we are then the small proportion that is still human gets smaller and smaller and smaller until it's just utterly negligible.

They are trying to sell this end-of-humanity-as-we-know-it as the next stage of 'evolution' when we become super-human and 'like the gods'. They are lying to you. Shocked, eh? The population, and again especially the young, have been manipulated into addiction to technologies designed to enslave them for life. First they induced an addiction to smartphones (holdables); next they moved to technology on the body (wearables); and then began the invasion of the body (implantables). I warned way back about the plan for microchipped people and we are now entering that era. We should not be diverted into thinking that this refers only to chips we can see. Most important are the nanochips known as smart dust, neural dust and nanobots which are far too small to be seen by the human eye. Nanotechnology is everywhere, increasingly in food products, and released into the atmosphere by the geoengineering of the skies funded by Bill Gates to 'shut out the Sun' and 'save the planet from global warming'. Gates has been funding a project to spray millions of tonnes of chalk (calcium carbonate) into the stratosphere over Sweden to 'dim the Sun' and cool the Earth. Scientists warned the move could be disastrous for weather systems in ways no one can predict and opposition led to the Swedish space agency announcing that the 'experiment' would not be happening as planned in the summer of 2021; but it shows where the Cult is going with dimming the impact of the Sun and there's an associated plan to change the planet's atmosphere. Who gives psychopath Gates the right to dictate to the entire human race and dismantle planetary systems? The world will not be safe while this man is at large.

The global warming hoax has made the Sun, like the gas of life, something to fear when both are essential to good health and human survival (more inversion). The body transforms sunlight into vital vitamin D through a process involving … *cholesterol*. This is the cholesterol we are also told to fear. We are urged to take Big Pharma

statin drugs to reduce cholesterol and it's all systematic. Reducing cholesterol means reducing vitamin D uptake with all the multiple health problems that will cause. At least if you take statins long term it saves the government from having to pay you a pension. The delivery system to block sunlight is widely referred to as chemtrails although these have a much deeper agenda, too. They appear at first to be contrails or condensation trails streaming from aircraft into cold air at high altitudes. Contrails disperse very quickly while chemtrails do not and spread out across the sky before eventually their content falls to earth. Many times I have watched aircraft cross-cross a clear blue sky releasing chemtrails until it looks like a cloudy day. Chemtrails contain many things harmful to humans and the natural world including toxic heavy metals, aluminium (see Alzheimer's) and nanotechnology. Ray Kurzweil reveals the reason without actually saying so: 'Nanobots will infuse all the matter around us with information. Rocks, trees, everything will become these intelligent creatures.' How do you deliver that? *From the sky*. Self-replicating nanobots would connect everything to the Smart Grid. The phenomenon of Morgellons disease began in the chemtrail era and the correlation has led to it being dubbed the 'chemtrail disease'. Self-replicating fibres appear in the body that can be pulled out through the skin. Morgellons fibres continue to grow outside the body and have a form of artificial intelligence. I cover this at greater length in *Phantom Self*.

'Vaccine' operating system

'Covid vaccines' with their self-replicating synthetic material are also designed to make the connection between humanity and Kurzweil's 'cloud'. American doctor and dedicated campaigner for truth, Carrie Madej, an Internal Medicine Specialist in Georgia with more than 20 years medical experience, has highlighted the nanotechnology aspect of the fake 'vaccines'. She explains how one of the components in at least the Moderna and Pfizer synthetic potions are 'lipid nanoparticles' which are 'like little tiny computer bits' – a 'sci-fi substance' known as nanobots and hydrogel which can be 'triggered

at any moment to deliver its payload' and act as 'biosensors'. The synthetic substance had 'the ability to accumulate data from your body like your breathing, your respiration, thoughts and emotions, all kind of things' and each syringe could carry a *million* nanobots:

This substance because it's like little bits of computers in your body, crazy, but it's true, it can do that, [and] obviously has the ability to act through Wi-Fi. It can receive and transmit energy, messages, frequencies or impulses. That issue has never been addressed by these companies. What does that do to the human?

Just imagine getting this substance in you and it can react to things all around you, the 5G, your smart device, your phones, what is happening with that? What if something is triggering it, too, like an impulse, a frequency? We have something completely foreign in the human body.

Madej said her research revealed that electromagnetic (EMF) frequencies emitted by phones and other devices had increased dramatically in the same period of the 'vaccine' rollout and she was seeing more people with radiation problems as 5G and other electromagnetic technology was expanded and introduced to schools and hospitals. She said she was 'floored with the EMF coming off' the devices she checked. All this makes total sense and syncs with my own work of decades when you think that Moderna refers in documents to its mRNA 'vaccine' as an 'operating system':

Recognizing the broad potential of mRNA science, we set out to create an mRNA technology platform that functions very much like an operating system on a computer. It is designed so that it can plug and play interchangeably with different programs. In our case, the 'program' or 'app' is our mRNA drug – the unique mRNA sequence that codes for a protein …

… Our MRNA Medicines – 'The 'Software Of Life': When we have a concept for a new mRNA medicine and begin research, fundamental components are already in place. Generally, the only thing that changes from one potential mRNA medicine to another is the coding region – the actual genetic code that instructs ribosomes to make protein. Utilizing these instruction sets gives our investigational mRNA medicines a software-like quality. We also have the ability to combine different mRNA sequences encoding for different proteins in a single mRNA investigational medicine.

Who needs a real 'virus' when you can create a computer version to justify infusing your operating system into the entire human race on the road to making living, breathing people into cyborgs? What is missed with the 'vaccines' is the *digital* connection between synthetic material and the body that I highlighted earlier with the study that hacked a computer with human DNA. On one level the body is digital, based on mathematical codes, and I'll have more about that in the next chapter. Those who ridiculously claim that mRNA 'vaccines' are not designed to change human genetics should explain the words of Dr Tal Zaks, chief medical officer at Moderna, in a 2017 TED talk. He said that over the last 30 years 'we've been living this phenomenal digital scientific revolution, and I'm here today to tell you, that we are actually *hacking the software of life*, and that it's changing the way we think about prevention and treatment of disease':

In every cell there's this thing called messenger RNA, or mRNA for short, that transmits the critical information from the DNA in our genes to the protein, which is really the stuff we're all made out of. This is the critical information that determines what the cell will do. So we think about it as an operating system. So if you could change that, if you could introduce a line of code, or change a line of code, it turns out, that has profound implications for everything, from the flu to cancer.

Zaks should more accurately have said that this has profound implications for the human genetic code and the nature of DNA. Communications within the body go both ways and not only one. But, hey, no, the 'Covid vaccine' will not affect your genetics. Cult fact-checkers say so even though the man who helped to develop the mRNA technique says that it does. Zaks said in 2017:

If you think about what it is we're trying to do. We've taken information and our understanding of that information and how that information is transmitted in a cell, and we've taken our understanding of medicine and how to make drugs, and we're fusing the two. We think of it as information therapy.

I have been writing for decades that the body is an information field communicating with itself and the wider world. This is why

radiation which is information can change the information field of body and mind through phenomena like 5G and change their nature and function. 'Information therapy' means to change the body's information field and change the way it operates. DNA is a receiver-transmitter of information and can be mutated by information like mRNA synthetic messaging. Technology to do this has been ready and waiting in the underground bases and other secret projects to be rolled out when the 'Covid' hoax was played. 'Trials' of such short and irrelevant duration were only for public consumption. When they say the 'vaccine' is 'experimental' that is not true. It may appear to be 'experimental' to those who don't know what's going on, but the trials have already been done to ensure the Cult gets the result it desires. Zaks said that it took decades to sequence the human genome, completed in 2003, but now they could do it in a week. By 'they' he means scientists operating in the public domain. In the secret projects they were sequencing the genome in a week long before even 2003.

Deluge of mRNA

Highly significantly the Moderna document says the guiding premise is that if using mRNA as a medicine works for one disease then it should work for many diseases. They were leveraging the flexibility afforded by their platform and the fundamental role mRNA plays in protein synthesis to pursue mRNA medicines for a broad spectrum of diseases. Moderna is confirming what I was saying through 2020 that multiple 'vaccines' were planned for 'Covid' (and later invented 'variants') and that previous vaccines would be converted to the mRNA system to infuse the body with massive amounts of genetically-manipulating synthetic material to secure a transformation to a synthetic-biological state. The 'vaccines' are designed to kill stunning numbers as part of the long-exposed Cult depopulation agenda and transform the rest. Given this is the goal you can appreciate why there is such hysterical demand for every human to be 'vaccinated' for an alleged 'disease' that has an estimated 'infection' to 'death' ratio of 0.23-0.15 percent. As I write

children are being given the 'vaccine' in trials (their parents are a disgrace) and ever-younger people are being offered the vaccine for a 'virus' that even if you believe it exists has virtually zero chance of harming them. Horrific effects of the 'trials' on a 12-year-old girl were revealed by a family member to be serious brain and gastric problems that included a bowel obstruction and the inability to swallow liquids or solids. She was unable to eat or drink without throwing up, had extreme pain in her back, neck and abdomen, and was paralysed from the waist down which stopped her urinating unaided. When the girl was first taken to hospital doctors said it was all in her mind. She was signed up for the 'trial' by her parents for whom no words suffice. None of this 'Covid vaccine' insanity makes any sense unless you see what the 'vaccine' really is – a body-changer. Synthetic biology or 'SynBio' is a fast-emerging and expanding scientific discipline which includes everything from genetic and molecular engineering to electrical and computer engineering. Synthetic biology is defined in these ways:

- A multidisciplinary area of research that seeks to create new biological parts, devices, and systems, or to redesign systems that are already found in nature.

- The use of a mixture of physical engineering and genetic engineering to create new (and therefore synthetic) life forms.

- An emerging field of research that aims to combine the knowledge and methods of biology, engineering and related disciplines in the design of chemically-synthesized DNA to create organisms with novel or enhanced characteristics and traits (synthetic organisms including humans).

We now have synthetic blood, skin, organs and limbs being developed along with synthetic body parts produced by 3D printers. These are all elements of the synthetic human programme and this comment by Kurzweil's co-founder of the Singularity University,

Peter Diamandis, can be seen in a whole new light with the 'Covid' hoax and the sanctions against those that refuse the 'vaccine':

Anybody who is going to be resisting the progress forward [to transhumanism] is going to be resisting evolution and, fundamentally, they will die out. It's not a matter of whether it's good or bad. It's going to happen.

'Resisting evolution'? What absolute bollocks. The arrogance of these people is without limit. His 'it's going to happen' mantra is another way of saying 'resistance is futile' to break the spirit of those pushing back and we must not fall for it. Getting this genetically-transforming 'vaccine' into everyone is crucial to the Cult plan for total control and the desperation to achieve that is clear for anyone to see. Vaccine passports are a major factor in this and they, too, are a form of resistance is futile. It's NOT. The paper funded by the Rockefeller Foundation for the 2013 'health conference' in China said:

We will interact more with artificial intelligence. The use of robotics, bio-engineering to augment human functioning is already well underway and will advance. Re-engineering of humans into potentially separate and unequal forms through genetic engineering or mixed human-robots raises debates on ethics and equality.

A new demography is projected to emerge after 2030 [that year again] of technologies (robotics, genetic engineering, nanotechnology) producing robots, engineered organisms, 'nanobots' and artificial intelligence (AI) that can self-replicate. Debates will grow on the implications of an impending reality of human designed life.

What is happening today is so long planned. The world army enforcing the will of the world government is intended to be a robot army, not a human one. Today's military and its technologically 'enhanced' troops, pilotless planes and driverless vehicles are just stepping stones to that end. Human soldiers are used as Cult fodder and its time they woke up to that and worked for the freedom of the population instead of their own destruction and their family's destruction – the same with the police. Join us and let's sort this out. The phenomenon of enforce my own destruction is widespread in the 'Covid' era with Woker 'luvvies' in the acting and entertainment

industries supporting 'Covid' rules which have destroyed their profession and the same with those among the public who put signs on the doors of their businesses 'closed due to Covid – stay safe' when many will never reopen. It's a form of masochism and most certainly insanity.

Transgender = transhumanism

When something explodes out of nowhere and is suddenly everywhere it is always the Cult agenda and so it is with the tidal wave of claims and demands that have infiltrated every aspect of society under the heading of 'transgenderism'. The term 'trans' is so 'in' and this is the dictionary definition:

A prefix meaning 'across', 'through', occurring … in loanwords from Latin, used in particular for denoting movement or conveyance from place to place (transfer; transmit; transplant) or complete change (transform; transmute), or to form adjectives meaning 'crossing', 'on the other side of', or 'going beyond' the place named (transmontane; transnational; trans-Siberian).

Transgender means to go beyond gender and transhuman means to go beyond human. Both are aspects of the Cult plan to transform the human body to a synthetic state with *no gender*. Human 2.0 is not designed to procreate and would be produced technologically with no need for parents. The new human would mean the end of parents and so men, and increasingly women, are being targeted for the deletion of their rights and status. Parental rights are disappearing at an ever-quickening speed for the same reason. The new human would have no need for men or women when there is no procreation and no gender. Perhaps the transgender movement that appears to be in a permanent state of frenzy might now contemplate on how it is being used. This was never about transgender rights which are only the interim excuse for confusing gender, particularly in the young, on the road to *fusing* gender. Transgender activism is not an end; it is a *means* to an end. We see again the technique of creative destruction in which you destroy the status quo to 'build back better' in the form that you want. The gender status quo had to be

destroyed by persuading the Cult-created Woke mentality to believe that you can have 100 genders or more. A programme for 9 to 12 year olds produced by the Cult-owned BBC promoted the 100 genders narrative. The very idea may be the most monumental nonsense, but it is not what is true that counts, only what you can make people *believe* is true. Once the gender of 2 + 2 = 4 has been dismantled through indoctrination, intimidation and 2 + 2 = 5 then the new no-gender normal can take its place with Human 2.0. Aldous Huxley revealed the plan in his prophetic *Brave New World* in 1932:

> Natural reproduction has been done away with and children are created, decanted', and raised in 'hatcheries and conditioning centres'. From birth, people are genetically designed to fit into one of five castes, which are further split into 'Plus' and 'Minus' members and designed to fulfil predetermined positions within the social and economic strata of the World State.

How could Huxley know this in 1932? For the same reason George Orwell knew about the Big Brother state in 1948, Cult insiders I have quoted knew about it in 1969, and I have known about it since the early 1990s. If you are connected to the Cult or you work your balls off to uncover the plan you can predict the future. The process is simple. If there is a plan for the world and nothing intervenes to stop it then it will happen. Thus if you communicate the plan ahead of time you are perceived to have predicted the future, but you haven't. You have revealed the plan which without intervention will become the human future. The whole reason I have done what I have is to alert enough people to inspire an intervention and maybe at last that time has come with the Cult and its intentions now so obvious to anyone with a brain in working order.

The future is here

Technological wombs that Huxley described to replace parent procreation are already being developed and they are only the projects we know about in the public arena. Israeli scientists told *The Times of Israel* in March, 2021, that they have grown 250-cell embryos

into mouse foetuses with fully formed organs using artificial wombs in a development they say could pave the way for gestating humans outside the womb. Professor Jacob Hanna of the Weizmann Institute of Science said:

We took mouse embryos from the mother at day five of development, when they are just of 250 cells, and had them in the incubator from day five until day 11, by which point they had grown all their organs.

By day 11 they make their own blood and have a beating heart, a fully developed brain. Anybody would look at them and say, 'this is clearly a mouse foetus with all the characteristics of a mouse.' It's gone from being a ball of cells to being an advanced foetus.

A special liquid is used to nourish embryo cells in a laboratory dish and they float on the liquid to duplicate the first stage of embryonic development. The incubator creates all the right conditions for its development, Hanna said. The liquid gives the embryo 'all the nutrients, hormones and sugars they need' along with a custom-made electronic incubator which controls gas concentration, pressure and temperature. The cutting-edge in the underground bases and other secret locations will be light years ahead of that, however, and this was reported by the London *Guardian* in 2017:

We are approaching a biotechnological breakthrough. Ectogenesis, the invention of a complete external womb, could completely change the nature of human reproduction. In April this year, researchers at the Children's Hospital of Philadelphia announced their development of an artificial womb.

The article was headed 'Artificial wombs could soon be a reality. What will this mean for women?' What would it mean for children is an even bigger question. No mother to bond with only a machine in preparation for a life of soulless interaction and control in a world governed by machines (see the *Matrix* movies). Now observe the calculated manipulations of the 'Covid' hoax as human interaction and warmth has been curtailed by distancing, isolation and fear with people communicating via machines on a scale never seen before.

These are all dots in the same picture as are all the personal assistants, gadgets and children's toys through which kids and adults communicate with AI as if it is human. The AI 'voice' on Sat-Nav should be included. All these things are psychological preparation for the Cult endgame. Before you can make a physical connection with AI you have to make a psychological connection and that is what people are being conditioned to do with this ever gathering human-AI interaction. Movies and TV programmes depicting the transhuman, robot dystopia relate to a phenomenon known as 'pre-emptive programming' in which the world that is planned is portrayed everywhere in movies, TV and advertising. This is conditioning the conscious and subconscious mind to become familiar with the planned reality to dilute resistance when it happens for real. What would have been a shock such is the change is made less so. We have young children put on the road to transgender transition surgery with puberty blocking drugs at an age when they could never be able to make those life-changing decisions.

Rachel Levine, a professor of paediatrics and psychiatry who believes in treating children this way, became America's highest-ranked openly-transgender official when she was confirmed as US Assistant Secretary at the Department of Health and Human Services after being nominated by Joe Biden (the Cult). Activists and governments press for laws to deny parents a say in their children's transition process so the kids can be isolated and manipulated into agreeing to irreversible medical procedures. A Canadian father Robert Hoogland was denied bail by the Vancouver Supreme Court in 2021 and remained in jail for breaching a court order that he stay silent over his young teenage daughter, a minor, who was being offered life-changing hormone therapy without parental consent. At the age of 12 the girl's 'school counsellor' said she may be transgender, referred her to a doctor and told the school to treat her like a boy. This is another example of state-serving schools imposing ever more control over children's lives while parents have ever less.

Contemptible and extreme child abuse is happening all over the world as the Cult gender-fusion operation goes into warp-speed.

Why the war on men – and now women?

The question about what artificial wombs mean for women should rightly be asked. The answer can be seen in the deletion of women's rights involving sport, changing rooms, toilets and status in favour of people in male bodies claiming to identify as women. I can identify as a mountain climber, but it doesn't mean I can climb a mountain any more than a biological man can be a biological woman. To believe so is a triumph of belief over factual reality which is the very perceptual basis of everything Woke. Women's sport is being destroyed by allowing those with male bodies who say they identify as female to 'compete' with girls and women. Male body 'women' dominate 'women's' competition with their greater muscle mass, bone density, strength and speed. With that disadvantage sport for women loses all meaning. To put this in perspective nearly 300 American high school boys can run faster than the quickest woman sprinter in the world. Women are seeing their previously protected spaces invaded by male bodies simply because they claim to identify as women. That's all they need to do to access all women's spaces and activities under the Biden 'Equality Act' that destroys equality for women with the usual Orwellian Woke inversion. Male sex offenders have already committed rapes in women's prisons after claiming to identify as women to get them transferred. Does this not matter to the Woke 'equality' hypocrites? Not in the least. What matters to Cult manipulators and funders behind transgender activists is to advance gender fusion on the way to the no-gender 'human'. When you are seeking to impose transparent nonsense like this, or the 'Covid' hoax, the only way the nonsense can prevail is through censorship and intimidation of dissenters, deletion of factual information, and programming of the unquestioning, bewildered and naive. You don't have to scan the world for long to see that all these things are happening.

Many women's rights organisations have realised that rights and status which took such a long time to secure are being eroded and that it is systematic. Kara Dansky of the global Women's Human Rights Campaign said that Biden's transgender executive order immediately he took office, subsequent orders, and Equality Act legislation that followed 'seek to erase women and girls in the law as a category'. *Exactly*. I said during the long ago-started war on men (in which many women play a crucial part) that this was going to turn into a war on them. The Cult is phasing out *both* male and female genders. To get away with that they are brought into conflict so they are busy fighting each other while the Cult completes the job with no unity of response. Unity, people, *unity*. We need unity everywhere. Transgender is the only show in town as the big step towards the no-gender human. It's not about rights for transgender people and never has been. Woke political correctness is deleting words relating to genders to the same end. Wokers believe this is to be 'inclusive' when the opposite is true. They are deleting words describing gender because gender *itself* is being deleted by Human 2.0. Terms like 'man', 'woman', 'mother' and 'father' are being deleted in the universities and other institutions to be replaced by the *no*-gender, not trans-gender, 'individuals' and 'guardians'. Women's rights campaigner Maria Keffler of Partners for Ethical Care said: 'Children are being taught from kindergarten upward that some boys have a vagina, some girls have a penis, and that kids can be any gender they want to be.' Do we really believe that suddenly countries all over the world at the same time had the idea of having drag queens go into schools or read transgender stories to very young children in the local library? It's coldly-calculated confusion of gender on the way to the fusion of gender. Suzanne Vierling, a psychologist from Southern California, made another important point:

Yesterday's slave woman who endured gynecological medical experiments is today's girl-child being butchered in a booming gender-transitioning sector. Ovaries removed, pushing her into menopause and osteoporosis, uncharted territory, and parents' rights and authority decimated.

The erosion of parental rights is a common theme in line with the Cult plans to erase the very concept of parents and 'ovaries removed, pushing her into menopause' means what? Those born female lose the ability to have children – another way to discontinue humanity as we know it.

Eliminating Human 1.0 (before our very eyes)

To pave the way for Human 2.0 you must phase out Human 1.0. This is happening through plummeting sperm counts and making women infertile through an onslaught of chemicals, radiation (including smartphones in pockets of men) and mRNA 'vaccines'. Common agriculture pesticides are also having a devastating impact on human fertility. I have been tracking collapsing sperm counts in the books for a long time and in 2021 came a book by fertility scientist and reproductive epidemiologist Shanna Swan, *Count Down: How Our Modern World Is Threatening Sperm Counts, Altering Male and Female Reproductive Development and Imperiling the Future of the Human Race*. She reports how the global fertility rate dropped by *half* between 1960 and 2016 with America's birth rate 16 percent below where it needs to be to sustain the population. Women are experiencing declining egg quality, more miscarriages, and more couples suffer from infertility. Other findings were an increase in erectile dysfunction, infant boys developing more genital abnormalities, male problems with conception, and plunging levels of the male hormone testosterone which would explain why so many men have lost their backbone and masculinity. This has been very evident during the 'Covid' hoax when women have been prominent among the Pushbackers and big strapping blokes have bowed their heads, covered their faces with a nappy and quietly submitted. Mind control expert Cathy O'Brien also points to how global education introduced the concept of 'we're all winners' in sport and classrooms: 'Competition was defused, and it in turn defused a sense of fighting back.' This is another version of the 'equity' doctrine in which you drive down rather than raise up. What a contrast in Cult-controlled China with its global ambitions

where the government published plans in January, 2021, to 'cultivate masculinity' in boys from kindergarten through to high school in the face of a 'masculinity crisis'. A government adviser said boys would be soon become 'delicate, timid and effeminate' unless action was taken. Don't expect any similar policy in the targeted West. A 2006 study showed that a 65-year-old man in 2002 had testosterone levels *15 percent* lower than a 65-year-old man in 1987 while a 2020 study found a similar story with young adults and adolescents. Men are getting prescriptions for testosterone replacement therapy which causes an even greater drop in sperm count with up to 99 percent seeing sperm counts drop to zero during the treatment. More sperm is defective and malfunctioning with some having two heads or not pursuing an egg.

A class of *synthetic* chemicals known as phthalates are being blamed for the decline. These are found everywhere in plastics, shampoos, cosmetics, furniture, flame retardants, personal care products, pesticides, canned foods and even receipts. Why till receipts? Everyone touches them. Let no one delude themselves that all this is not systematic to advance the long-time agenda for human body transformation. Phthalates mimic hormones and disrupt the hormone balance causing testosterone to fall and genital birth defects in male infants. Animals and fish have been affected in the same way due to phthalates and other toxins in rivers. When fish turn gay or change sex through chemicals in rivers and streams it is a pointer to why there has been such an increase in gay people and the sexually confused. It doesn't matter to me what sexuality people choose to be, but if it's being affected by chemical pollution and consumption then we need to know. Does anyone really think that this is not connected to the transgender agenda, the war on men and the condemnation of male 'toxic masculinity'? You watch this being followed by 'toxic femininity'. It's already happening. When breastfeeding becomes 'chest-feeding', pregnant women become pregnant people along with all the other Woke claptrap you know that the world is going insane and there's a Cult scam in progress. Transgender activists are promoting the Cult agenda while Cult

billionaires support and fund the insanity as they laugh themselves to sleep at the sheer stupidity for which humans must be infamous in galaxies far, far away.

'Covid vaccines' and female infertility

We can now see why the 'vaccine' has been connected to potential infertility in women. Dr Michael Yeadon, former Vice President and Chief Scientific Advisor at Pfizer, and Dr Wolfgang Wodarg in Germany, filed a petition with the European Medicines Agency in December, 2020, urging them to stop trials for the Pfizer/BioNTech shot and all other mRNA trials until further studies had been done. They were particularly concerned about possible effects on fertility with 'vaccine'-produced antibodies attacking the protein Syncytin-1 which is responsible for developing the placenta. The result would be infertility 'of indefinite duration' in women who have the 'vaccine' with the placenta failing to form. Section 10.4.2 of the Pfizer/BioNTech trial protocol says that pregnant women or those who might become so should not have mRNA shots. Section 10.4 warns men taking mRNA shots to 'be abstinent from heterosexual intercourse' and not to donate sperm. The UK government said that it *did not know* if the mRNA procedure had an effect on fertility. *Did not know?* These people have to go to jail. UK government advice did not recommend at the start that pregnant women had the shot and said they should avoid pregnancy for at least two months after 'vaccination'. The 'advice' was later updated to pregnant women should only have the 'vaccine' if the benefits outweighed the risks to mother and foetus. What the hell is that supposed to mean? Then 'spontaneous abortions' began to appear and rapidly increase on the adverse reaction reporting schemes which include only a fraction of adverse reactions. Thousands and ever-growing numbers of 'vaccinated' women are describing changes to their menstrual cycle with heavier blood flow, irregular periods and menstruating again after going through the menopause – all links to reproduction effects. Women are passing blood clots and the lining of their uterus while men report erectile dysfunction and blood effects. Most

significantly of all *un*vaccinated women began to report similar menstrual changes after interaction with *'vaccinated'* people and men and children were also affected with bleeding noses, blood clots and other conditions. 'Shedding' is when vaccinated people can emit the content of a vaccine to affect the unvaccinated, but this is different. 'Vaccinated' people were not shedding a 'live virus' allegedly in 'vaccines' as before because the fake 'Covid vaccines' involve synthetic material and other toxicity. Doctors exposing what is happening prefer the term 'transmission' to shedding. Somehow those that have had the shots are transmitting effects to those that haven't. Dr Carrie Madej said the nano-content of the 'vaccines' can 'act like an antenna' to others around them which fits perfectly with my own conclusions. This 'vaccine' transmission phenomenon was becoming known as the book went into production and I deal with this further in the Postscript.

Vaccine effects on sterility are well known. The World Health Organization was accused in 2014 of sterilising millions of women in Kenya with the evidence confirmed by the content of the vaccines involved. The same WHO behind the 'Covid' hoax admitted its involvement for more than ten years with the vaccine programme. Other countries made similar claims. Charges were lodged by Tanzania, Nicaragua, Mexico, and the Philippines. The Gardasil vaccine claimed to protect against a genital 'virus' known as HPV has also been linked to infertility. Big Pharma and the WHO (same thing) are criminal and satanic entities. Then there's the Bill Gates Foundation which is connected through funding and shared interests with 20 pharmaceutical giants and laboratories. He stands accused of directing the policy of United Nations Children's Fund (UNICEF), vaccine alliance GAVI, and other groupings, to advance the vaccine agenda and silence opposition at great cost to women and children. At the same time Gates wants to reduce the global population. Coincidence?

Great Reset = Smart Grid = new human

The Cult agenda I have been exposing for 30 years is now being openly promoted by Cult assets like Gates and Klaus Schwab of the World Economic Forum under code-terms like the 'Great Reset', 'Build Back Better' and 'a rare but narrow window of opportunity to reflect, reimagine, and reset our world'. What provided this 'rare but narrow window of opportunity'? The 'Covid' hoax did. Who created that? *They* did. My books from not that long ago warned about the planned 'Internet of Things' (IoT) and its implications for human freedom. This was the plan to connect all technology to the Internet and artificial intelligence and today we are way down that road with an estimated 36 billion devices connected to the World Wide Web and that figure is projected to be 76 billion by 2025. I further warned that the Cult planned to go beyond that to the Internet of *Everything* when the human brain was connected via AI to the Internet and Kurzweil's 'cloud'. Now we have Cult operatives like Schwab calling for precisely that under the term 'Internet of Bodies', a fusion of the physical, digital and biological into one centrally-controlled Smart Grid system which the Cult refers to as the 'Fourth Industrial Revolution'. They talk about the 'biological', but they really mean the synthetic-biological which is required to fully integrate the human body and brain into the Smart Grid and artificial intelligence planned to replace the human mind. We have everything being synthetically manipulated including the natural world through GMO and smart dust, the food we eat and the human body itself with synthetic 'vaccines'. I said in *The Answer* that we would see the Cult push for synthetic meat to replace animals and in February, 2021, the so predictable psychopath Bill Gates called for the introduction of synthetic meat to save us all from 'climate change'. The climate hoax just keeps on giving like the 'Covid' hoax. The war on meat by vegan activists is a carbon (oops, sorry) copy of the manipulation of transgender activists. They have no idea (except their inner core) that they are being used to promote and impose the agenda of the Cult or that they are only the *vehicle* and not the *reason*. This is not to say those who choose not to eat meat shouldn't be respected and supported in that right, but there are ulterior motives

for those in power. A *Forbes* article in December, 2019, highlighted the plan so beloved of Schwab and the Cult under the heading: 'What Is The Internet of Bodies? And How Is It Changing Our World?' The article said the human body is the latest data platform (remember 'our vaccine is an operating system'). *Forbes* described the plan very accurately and the words could have come straight out of my books from long before:

The Internet of Bodies (IoB) is an extension of the IoT and basically connects the human body to a network through devices that are ingested, implanted, or connected to the body in some way. Once connected, data can be exchanged, and the body and device can be remotely monitored and controlled.

They were really describing a human hive mind with human perception centrally-dictated via an AI connection as well as allowing people to be 'remotely monitored and controlled'. Everything from a fridge to a human mind could be directed from a central point by these insane psychopaths and 'Covid vaccines' are crucial to this. Forbes explained the process I mentioned earlier of holdable and wearable technology followed by implantable. The article said there were three generations of the Internet of Bodies that include:

- Body external: These are wearable devices such as Apple Watches or Fitbits that can monitor our health.

- Body internal: These include pacemakers, cochlear implants, and digital pills that go inside our bodies to monitor or control various aspects of health.

- Body embedded: The third generation of the Internet of Bodies is embedded technology where technology and the human body are melded together and have a real-time connection to a remote machine.

Forbes noted the development of the Brain Computer Interface (BCI) which merges the brain with an external device for monitoring and controlling in real-time. 'The ultimate goal is to help restore function to individuals with disabilities by using brain signals rather than conventional neuromuscular pathways.' Oh, do fuck off. The goal of brain interface technology is controlling human thought and emotion from the central point in a hive mind serving its masters wishes. Many people are now agreeing to be chipped to open doors without a key. You can recognise them because they'll be wearing a mask, social distancing and lining up for the 'vaccine'. The Cult plans a Great Reset money system after they have completed the demolition of the global economy in which 'money' will be exchanged through communication with body operating systems. Rand Corporation, a Cult-owned think tank, said of the Internet of Bodies or IoB:

> Internet of Bodies technologies fall under the broader IoT umbrella. But as the name suggests, IoB devices introduce an even more intimate interplay between humans and gadgets. IoB devices monitor the human body, collect health metrics and other personal information, and transmit those data over the Internet. Many devices, such as fitness trackers, are already in use … IoB devices … and those in development can track, record, and store users' whereabouts, bodily functions, and what they see, hear, and even think.

Schwab's World Economic Forum, a long-winded way of saying 'fascism' or 'the Cult', has gone full-on with the Internet of Bodies in the 'Covid' era. 'We're entering the era of the Internet of Bodies', it declared, 'collecting our physical data via a range of devices that can be implanted, swallowed or worn'. The result would be a huge amount of health-related data that could improve human wellbeing around the world, and prove crucial in fighting the 'Covid-19 pandemic'. Does anyone think these clowns care about 'human wellbeing' after the death and devastation their pandemic hoax has purposely caused? Schwab and co say we should move forward with the Internet of Bodies because 'Keeping track of symptoms could help us stop the spread of infection, and quickly detect new cases'. How wonderful, but keeping track' is all they are really bothered

about. Researchers were investigating if data gathered from smartwatches and similar devices could be used as viral infection alerts by tracking the user's heart rate and breathing. Schwab said in his 2018 book *Shaping the Future of the Fourth Industrial Revolution*:

> The lines between technologies and beings are becoming blurred and not just by the ability to create lifelike robots or synthetics. Instead it is about the ability of new technologies to literally become part of us. Technologies already influence how we understand ourselves, how we think about each other, and how we determine our realities. As the technologies … give us deeper access to parts of ourselves, we may begin to integrate digital technologies into our bodies.

You can see what the game is. Twenty-four hour control and people – if you could still call them that – would never know when something would go ping and take them out of circulation. It's the most obvious rush to a global fascist dictatorship and the complete submission of humanity and yet still so many are locked away in their Cult-induced perceptual coma and can't see it.

Smart Grid control centres

The human body is being transformed by the 'vaccines' and in other ways into a synthetic cyborg that can be attached to the global Smart Grid which would be controlled from a central point and other sub-locations of Grid manipulation. Where are these planned to be? Well, China for a start which is one of the Cult's biggest centres of operation. The technological control system and technocratic rule was incubated here to be unleashed across the world after the 'Covid' hoax came out of China in 2020. Another Smart Grid location that will surprise people new to this is Israel. I have exposed in *The Trigger* how Sabbatian technocrats, intelligence and military operatives were behind the horrors of 9/11 and not '19 Arab hijackers' who somehow manifested the ability to pilot big passenger airliners when instructors at puddle-jumping flying schools described some of them as a joke. The 9/11 attacks were made possible through control of civilian and military air computer systems and those of the White House, Pentagon and connected agencies. See *The Trigger* – it

will blow your mind. The controlling and coordinating force were the Sabbatian networks in Israel and the United States which by then had infiltrated the entire US government, military and intelligence system. The real name of the American Deep State is 'Sabbatian State'. Israel is a tiny country of only nine million people, but it is one of the global centres of cyber operations and fast catching Silicon Valley in importance to the Cult. Israel is known as the 'start-up nation' for all the cyber companies spawned there with the Sabbatian specialisation of 'cyber security' that I mentioned earlier which gives those companies access to computer systems of their clients in real time through 'backdoors' written into the coding when security software is downloaded. The Sabbatian centre of cyber operations outside Silicon Valley is the Israeli military Cyber Intelligence Unit, the biggest infrastructure project in Israel's history, headquartered in the desert-city of Beersheba and involving some 20,000 'cyber soldiers'. Here are located a literal army of Internet trolls scanning social media, forums and comment lists for anyone challenging the Cult agenda. The UK military has something similar with its 77th Brigade and associated operations. The Beersheba complex includes research and development centres for other Cult operations such as Intel, Microsoft, IBM, Google, Apple, Hewlett-Packard, Cisco Systems, Facebook and Motorola. Techcrunch.com ran an article about the Beersheba global Internet technology centre headlined 'Israel's desert city of Beersheba is turning into a cybertech oasis':

> The military's massive relocation of its prestigious technology units, the presence of multinational and local companies, a close proximity to Ben Gurion University and generous government subsidies are turning Beersheba into a major global cybertech hub. Beersheba has all of the ingredients of a vibrant security technology ecosystem, including Ben Gurion University with its graduate program in cybersecurity and Cyber Security Research Center, and the presence of companies such as EMC, Deutsche Telekom, PayPal, Oracle, IBM, and Lockheed Martin. It's also the future home of the INCB (Israeli National Cyber Bureau); offers a special income tax incentive for cyber security companies, and was the site for the relocation of the army's intelligence corps units.

Sabbatians have taken over the cyber world through the following process: They scan the schools for likely cyber talent and develop them at Ben Gurion University and their period of conscription in the Israeli Defense Forces when they are stationed at the Beersheba complex. When the cyber talented officially leave the army they are funded to start cyber companies with technology developed by themselves or given to them by the state. Much of this is stolen through backdoors of computer systems around the world with America top of the list. Others are sent off to Silicon Valley to start companies or join the major ones and so we have many major positions filled by apparently 'Jewish' but really Sabbatian operatives. Google, YouTube and Facebook are all run by 'Jewish' CEOs while Twitter is all but run by ultra-Zionist hedge-fund shark Paul Singer. At the centre of the Sabbatian global cyber web is the Israeli army's Unit 8200 which specialises in hacking into computer systems of other countries, inserting viruses, gathering information, instigating malfunction, and even taking control of them from a distance. A long list of Sabbatians involved with 9/11, Silicon Valley and Israeli cyber security companies are operatives of Unit 8200. This is not about Israel. It's about the Cult. Israel is planned to be a Smart Grid hub as with China and what is happening at Beersheba is not for the benefit of Jewish people who are treated disgustingly by the Sabbatian elite that control the country. A glance at the Nuremberg Codes will tell you that.

The story is much bigger than 'Covid', important as that is to where we are being taken. Now, though, it's time to really strap in. There's more … much more …

CHAPTER ELEVEN

Who controls the Cult?

Awake, arise or be forever fall'n
John Milton, *Paradise Lost*

I have exposed this far the level of the Cult conspiracy that operates in the world of the seen and within the global secret society and satanic network which operates in the shadows one step back from the seen. The story, however, goes much deeper than that.

The 'Covid' hoax is major part of the Cult agenda, but only part, and to grasp the biggest picture we have to expand our attention beyond the realm of human sight and into the infinity of possibility that we cannot see. It is from here, ultimately, that humanity is being manipulated into a state of total control by the force which dictates the actions of the Cult. How much of reality can we see? Next to damn all is the answer. We may appear to see all there is to see in the 'space' our eyes survey and observe, but little could be further from the truth. The human 'world' is only a tiny band of frequency that the body's visual and perceptual systems can decode into *perception* of a 'world'. According to mainstream science the electromagnetic spectrum is 0.005 percent of what exists in the Universe (Fig 10). The maximum estimate I have seen is 0.5 percent and either way it's miniscule. I say it is far, far, smaller even than 0.005 percent when you compare reality we see with the totality of reality that we don't. Now get this if you are new to such information: Visible light, the only band of frequency that we can see, is a *fraction* of the 0.005

percent (Fig 11 overleaf). Take this further and realise that our universe is one of infinite universes and that universes are only a fragment of overall reality – *infinite* reality. Then compare that with the almost infinitesimal frequency band of visible light or human sight. You see that humans are as near blind as it is possible to be without actually being so. Artist and filmmaker, Sergio Toporek, said:

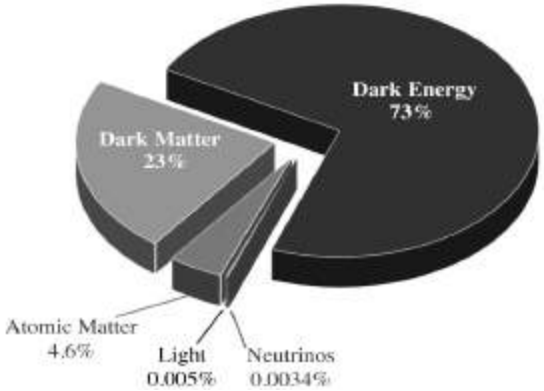

Figure 10: Humans can perceive such a tiny band of visual reality it's laughable.

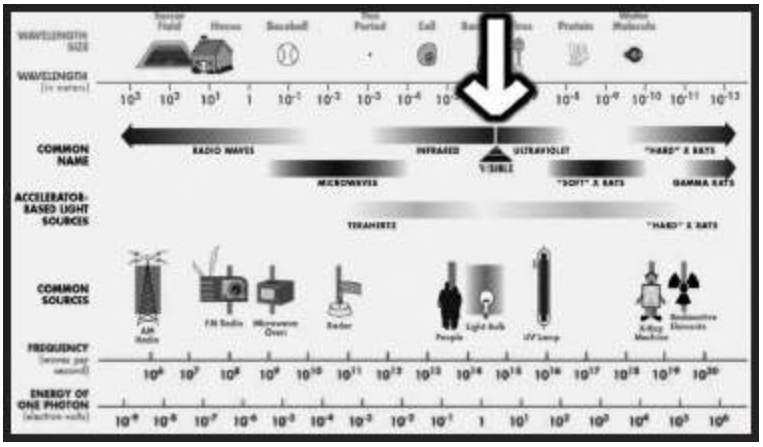

Figure 11: We can see a smear of the 0.005 percent electromagnetic spectrum, but we still know it all. Yep, makes sense.

Consider that you can see less than 1% of the electromagnetic spectrum and hear less than 1% of the acoustic spectrum. 90% of the cells in your body carry their own microbial DNA and are not 'you'. The atoms in your body are 99.9999999999999999% empty space and none of them are the ones you were born with ... Human beings have 46 chromosomes, two less than a potato.

The existence of the rainbow depends on the conical photoreceptors in your eyes; to animals without cones, the rainbow does not exist. So you don't just look at a rainbow, you create it. This is pretty amazing, especially considering that all the beautiful colours you see represent less than 1% of the electromagnetic spectrum.

Suddenly the 'world' of humans looks a very different place. Take into account, too, that Planet Earth when compared with the projected size of this single universe is the equivalent of a billionth of a pinhead. Imagine the ratio that would be when compared to infinite reality. To think that Christianity once insisted that Earth and humanity were the centre of everything. This background is vital if we are going to appreciate the nature of 'human' and how we can be manipulated by an unseen force. To human visual reality virtually *everything* is unseen and yet the prevailing perception within the institutions and so much of the public is that if we can't see it, touch it, hear it, taste it and smell it then it cannot exist. Such perception is indoctrinated and encouraged by the Cult and its agents because it isolates believers in the strictly limited, village-idiot, realm of the five senses where perceptions can be firewalled and information controlled. Most of those perpetuating the 'this-world-is-all-there-is' insanity are themselves indoctrinated into believing the same delusion. While major players and influencers know that official reality is laughable most of those in science, academia and medicine really believe the nonsense they peddle and teach succeeding generations. Those who challenge the orthodoxy are dismissed as nutters and freaks to protect the manufactured illusion from exposure. Observe the dynamic of the 'Covid' hoax and you will see how that takes the same form. The inner-circle psychopaths knows it's a gigantic scam, but almost the entirety of those imposing their fascist rules believe that 'Covid' is all that they're told it is.

Stolen identity

Ask people who they are and they will give you their name, place of birth, location, job, family background and life story. Yet that is not who they are – it is what they are *experiencing*. The difference is *absolutely crucial*. The true 'I', the eternal, infinite 'I', is consciousness,

a state of being aware. Forget 'form'. That is a vehicle for a brief experience. Consciousness does not come *from* the brain, but *through* the brain and even that is more symbolic than literal. We are awareness, pure awareness, and this is what withdraws from the body at what we call 'death' to continue our eternal beingness, *isness*, in other realms of reality within the limitlessness of infinity or the Biblical 'many mansions in my father's house'. Labels of a human life, man, woman, transgender, black, white, brown, nationality, circumstances and income are not who we are. They are what we are – awareness – is *experiencing* in a brief connection with a band of frequency we call 'human'. The labels are not the self; they are, to use the title of one of my books, a *Phantom* Self. I am not David Icke born in Leicester, England, on April 29th, 1952. I am the consciousness *having that experience*. The Cult and its non-human masters seek to convince us through the institutions of 'education', science, medicine, media and government that what we are *experiencing* is who we *are*. It's so easy to control and direct perception locked away in the bewildered illusions of the five senses with no expanded radar. Try, by contrast, doing the same with a humanity aware of its true self and its true power to consciously create its reality and experience. How is it possible to do this? We do it all day every day. If you perceive yourself as 'little me' with no power to impact upon your life and the world then your life experience will reflect that. You will hand the power you don't think you have to authority in all its forms which will use it to control your experience. This, in turn, will appear to confirm your perception of 'little me' in a self-fulfilling feedback loop. But that is what 'little me' really is – a *perception*. We are all 'big-me', infinite me, and the Cult has to make us forget that if its will is to prevail. We are therefore manipulated and pressured into self-identifying with human labels and not the consciousness/awareness *experiencing* those human labels.

The phenomenon of identity politics is a Cult-instigated manipulation technique to sub-divide previous labels into even smaller ones. A United States university employs this list of letters to

describe student identity: LGBTTQQFAGPBDSM or lesbian, gay, bisexual, transgender, transsexual, queer, questioning, flexual, asexual, gender-fuck, polyamorous, bondage/discipline, dominance/submission and sadism/masochism. I'm sure other lists are even longer by now as people feel the need to self-identity the 'I' with the minutiae of race and sexual preference. Wokers programmed by the Cult for generations believe this is about 'inclusivity' when it's really the Cult locking them away into smaller and smaller versions of Phantom Self while firewalling them from the influence of their true self, the infinite, eternal 'I'. You may notice that my philosophy which contends that we are all unique points of attention/awareness within the same infinite whole or Oneness is the ultimate non-racism. The very sense of Oneness makes the judgement of people by their body-type, colour or sexuality utterly ridiculous and confirms that racism has no understanding of reality (including anti-white racism). Yet despite my perception of life Cult agents and fast-asleep Wokers label me racist to discredit my information while they are themselves phenomenally racist and sexist. All they see is race and sexuality and they judge people as good or bad, demons or untouchables, by their race and sexuality. All they see is *Phantom Self* and perceive themselves in terms of Phantom Self. They are pawns and puppets of the Cult agenda to focus attention and self-identity in the five senses and play those identities against each other to divide and rule. Columbia University has introduced segregated graduations in another version of social distancing designed to drive people apart and teach them that different racial and cultural groups have nothing in common with each other. The last thing the Cult wants is unity. Again the pump-primers of this will be Cult operatives in the knowledge of what they are doing, but the rest are just the Phantom Self blind leading the Phantom Self blind. We *do* have something in common – we are all *the same consciousness* having different temporary experiences.

What is this 'human'?

Yes, what *is* 'human'? That is what we are supposed to be, right? I mean 'human'? True, but 'human' is the experience not the 'I'. Break it down to basics and 'human' is the way that information is processed. If we are to experience and interact with this band of frequency we call the 'world' we must have a vehicle that operates within that band of frequency. Our consciousness in its prime form cannot do that; it is way beyond the frequency of the human realm. My consciousness or awareness could not tap these keys and pick up the cup in front of me in the same way that radio station A cannot interact with radio station B when they are on different frequencies. The human body is the means through which we have that interaction. I have long described the body as a biological computer which processes information in a way that allows consciousness to experience this reality. The body is a receiver, transmitter and processor of information in a particular way that we call human. We visually perceive only the world of the five senses in a wakened state – that is the limit of the body's visual decoding system. In truth it's not even visual in the way we experience 'visual reality' as I will come to in a moment. We are 'human' because the body processes the information sources of human into a reality and behaviour system that we *perceive* as human. Why does an elephant act like an elephant and not like a human or a duck? The elephant's biological computer is a different information field and processes information according to that program into a visual and behaviour type we call an elephant. The same applies to everything in our reality. These body information fields are perpetuated through procreation (like making a copy of a software program). The Cult wants to break that cycle and intervene technologically to transform the human information field into one that will change what we call humanity. If it can change the human information field it will change the way that field processes information and change humanity both 'physically' and psychologically. Hence the *messenger* (information) RNA 'vaccines' and so much more that is targeting human genetics by changing the body's information – *messaging* – construct through food, drink, radiation, toxicity and other means.

Reality that we experience is nothing like reality as it really is in the same way that the reality people experience in virtual reality games is not the reality they are really living in. The game is only a decoded source of information that appears to be a reality. Our world is also an information construct – a *simulation* (more later). In its base form our reality is a wavefield of information much the same in theme as Wi-Fi. The five senses decode wavefield information into electrical information which they communicate to the brain to decode into holographic (illusory 'physical') information. Different parts of the brain specialise in decoding different senses and the information is fused into a reality that appears to be outside of us but is really inside the brain and the genetic structure in general (Fig 12 overleaf). DNA is a receiver-transmitter of information and a vital part of this decoding process and the body's connection to other realities. Change DNA and you change the way we decode and connect with reality – see 'Covid vaccines'. Think of computers decoding Wi-Fi. You have information encoded in a radiation field and the computer decodes that information into a very different form on the screen. You can't see the Wi-Fi until its information is made manifest on the screen and the information on the screen is inside the computer and not outside. I have just described how we decode the 'human world'. All five senses decode the waveform 'Wi-Fi' field into electrical signals and the brain (computer) constructs reality inside the brain and not outside – 'You don't just look at a rainbow, you create it'. Sound is a simple example. We don't hear sound until the brain decodes it. Waveform sound waves are picked up by the hearing sense and communicated to the brain in an electrical form to be decoded into the sounds that we hear. Everything we hear is inside the brain along with everything we see, feel, smell and taste. Words and language are waveform fields generated by our vocal chords which pass through this process until they are decoded by the brain into words that we hear. Different languages are different frequency fields or sound waves generated by vocal chords. Late British philosopher Alan Watts said:

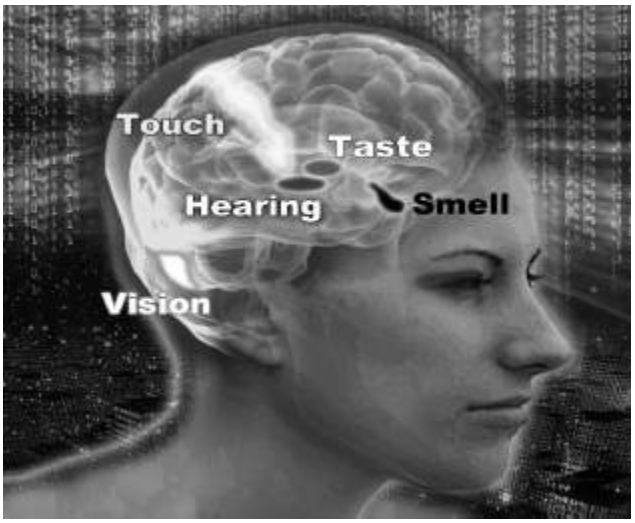

Figure 12: The brain receives information from the five senses and constructs from that our perceived reality.

[Without the brain] the world is devoid of light, heat, weight, solidity, motion, space, time or any other imaginable feature. All these phenomena are interactions, or transactions, of vibrations with a certain arrangement of neurons.

That's exactly what they are and scientist Robert Lanza describes in his book, *Biocentrism*, how we decode electromagnetic waves and energy into visual and 'physical' experience. He uses the example of a flame emitting photons, electromagnetic energy, each pulsing electrically and magnetically:

… these … invisible electromagnetic waves strike a human retina, and if (and only if) the waves happen to measure between 400 and 700 nano meters in length from crest to crest, then their energy is just right to deliver a stimulus to the 8 million cone-shaped cells in the retina.

Each in turn send an electrical pulse to a neighbour neuron, and on up the line this goes, at 250 mph, until it reaches the … occipital lobe of the brain, in the back of the head. There, a cascading complex of neurons fire from the incoming stimuli, and we subjectively perceive this experience as a yellow brightness occurring in a place we have been conditioned to call the 'external world'.

You hear what you decode

If a tree falls or a building collapses they make no noise unless someone is there to decode the energetic waves generated by the disturbance into what we call sound. Does a falling tree make a noise? Only if you hear it – *decode* it. Everything in our reality is a frequency field of information operating within the overall 'Wi-Fi' field that I call The Field. A vibrational disturbance is generated in The Field by the fields of the falling tree or building. These disturbance waves are what we decode into the sound of them falling. If no one is there to do that then neither will make any noise. Reality is created by the observer – *decoder* – and the *perceptions* of the observer affect the decoding process. For this reason different people – different *perceptions* – will perceive the same reality or situation in a different way. What one may perceive as a nightmare another will see as an opportunity. The question of why the Cult is so focused on controlling human perception now answers itself. All experienced reality is the act of decoding and we don't experience Wi-Fi until it is decoded on the computer screen. The sight and sound of an Internet video is encoded in the Wi-Fi all around us, but we don't see or hear it until the computer decodes that information. Taste, smell and touch are all phenomena of the brain as a result of the same process. We don't taste, smell or feel anything except in the brain and there are pain relief techniques that seek to block the signal from the site of discomfort to the brain because if the brain doesn't decode that signal we don't feel pain. Pain is in the brain and only appears to be at the point of impact thanks to the feedback loop between them. We don't see anything until electrical information from the sight senses is decoded in an area at the back of the brain. If that area is damaged we can go blind when our eyes are perfectly okay. So why do we go blind if we damage an eye? We damage the information processing between the waveform visual information and the visual decoding area of the brain. If information doesn't reach the brain in a form it can decode then we can't see the visual reality that it represents. What's more the brain is decoding only a fraction of the information it receives and the rest is absorbed by the

sub-conscious mind. This explanation is from the science magazine, *Wonderpedia*:

> Every second, 11 million sensations crackle along these [brain] pathways ... The brain is confronted with an alarming array of images, sounds and smells which it rigorously filters down until it is left with a manageable list of around 40. Thus 40 sensations per second make up what we perceive as reality.

The 'world' is not what people are told to believe that is it and the inner circles of the Cult *know that*.

Illusory 'physical' reality

We can only see a smear of 0.005 percent of the Universe which is only one of a vast array of universes – 'mansions' – within infinite reality. Even then the brain decodes only 40 pieces of information ('sensations') from a potential *11 million* that we receive every second. Two points strike you from this immediately: The sheer breathtaking stupidity of believing we know anything so rigidly that there's nothing more to know; and the potential for these processes to be manipulated by a malevolent force to control the reality of the population. One thing I can say for sure with no risk of contradiction is that when you can perceive an almost indescribable fraction of infinite reality there is always more to know as in tidal waves of it. Ancient Greek philosopher Socrates was so right when he said that wisdom is to know how little we know. How obviously true that is when you think that we are experiencing a physical world of solidity that is neither physical nor solid and a world of apartness when everything is connected. Cult-controlled 'science' dismisses the so-called 'paranormal' and all phenomena related to that when the 'para'-normal is perfectly normal and explains the alleged 'great mysteries' which dumbfound scientific minds. There is a reason for this. A 'scientific mind' in terms of the mainstream is a material mind, a five-sense mind imprisoned in see it, touch it, hear it, smell it and taste it. Phenomena and happenings that can't be explained that way leave the 'scientific mind' bewildered and the rule is that if they

can't account for why something is happening then it can't, by definition, be happening. I beg to differ. Telepathy is thought waves passing through The Field (think wave disturbance again) to be decoded by someone able to connect with that wavelength (information). For example: You can pick up the thought waves of a friend at any distance and at the very least that will bring them to mind. A few minutes later the friend calls you. 'My god', you say, 'that's incredible – I was just thinking of you.' Ah, but *they* were thinking of *you* before they made the call and that's what you decoded. Native peoples not entrapped in five-sense reality do this so well it became known as the 'bush telegraph'. Those known as psychics and mediums (genuine ones) are doing the same only across dimensions of reality. 'Mind over matter' comes from the fact that matter and mind are the *same*. The state of one influences the state of the other. Indeed one *and* the other are illusions. They are aspects of the same field. Paranormal phenomena are all explainable so why are they still considered 'mysteries' or not happening? Once you go down this road of understanding you begin to expand awareness beyond the five senses and that's the nightmare for the Cult.

Figure 13: Holograms are not solid, but the best ones appear to be.

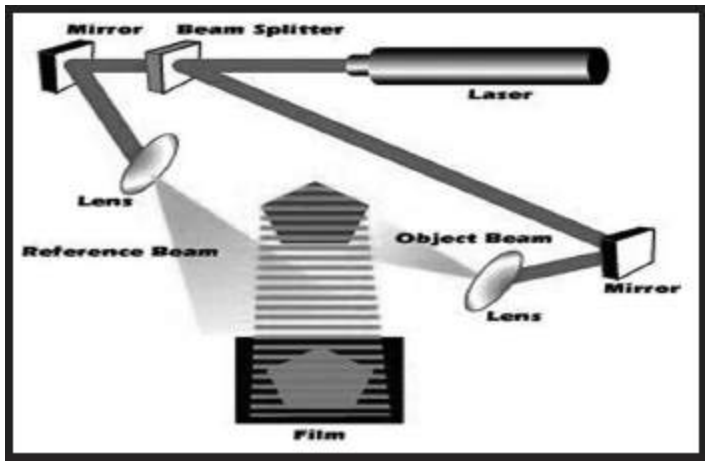

Figure 14: How holograms are created by capturing a waveform version of the subject image.

Holographic 'solidity'

Our reality is not solid, it is holographic. We are now well aware of holograms which are widely used today. Two-dimensional information is decoded into a three-dimensional reality that is not solid although can very much appear to be (Fig 13). Holograms are created with a laser divided into two parts. One goes directly onto a holographic photographic print ('reference beam') and the other takes a waveform image of the subject ('working beam') before being directed onto the print where it 'collides' with the other half of the laser (Fig 14). This creates a *waveform* interference pattern which contains the wavefield information of whatever is being photographed (Fig 15 overleaf). The process can be likened to dropping pebbles in a pond. Waves generated by each one spread out across the water to collide with the others and create a wave representation of where the stones fell and at what speed, weight and distance. A waveform interference pattern of a hologram is akin to the waveform information in The Field which the five senses decode into electrical signals to be decoded by the brain into a holographic illusory 'physical' reality. In the same way when a laser (think human attention) is directed at the waveform interference pattern a three-dimensional version of the subject is projected into apparently 'solid' reality (Fig 16). An amazing trait of holograms reveals more 'paranormal mysteries'. Information of the *whole*

hologram is encoded in waveform in every part of the interference pattern by the way they are created. This means that every *part* of a hologram is a smaller version of the whole. Cut the interference wave-pattern into four and you won't get four parts of the image. You get quarter-sized versions of the *whole* image. The body is a hologram and the same applies. Here we have the basis of acupuncture, reflexology and other forms of healing which identify representations of the whole body in all of the parts, hands, feet, ears, everywhere. Skilled palm readers can do what they do because the information of whole body is encoded in the hand. The concept of as above, so below, comes from this.

Figure 15: A waveform interference pattern that holds the information that transforms into a hologram.

Figure 16: Holographic people including 'Elvis' holographically inserted to sing a duet with Celine Dion.

The question will be asked of why, if solidity is illusory, we can't just walk through walls and each other. The resistance is not solid against solid; it is electromagnetic field against electromagnetic field and we decode this into the *experience* of solid against solid. We should also not underestimate the power of belief to dictate reality. What you believe is impossible *will be*. Your belief impacts on your decoding processes and they won't decode what you think is impossible. What we believe we perceive and what we perceive we experience. 'Can't dos' and 'impossibles' are like a firewall in a computer system that won't put on the screen what the firewall blocks. How vital that is to understanding how human experience has been hijacked. I explain in *The Answer*, *Everything You Need To Know But Have Never Been Told* and other books a long list of 'mysteries' and 'paranormal' phenomena that are not mysterious and perfectly normal once you realise what reality is and how it works. 'Ghosts' can be seen to pass through 'solid' walls because the walls are not solid and the ghost is a discarnate entity operating on a frequency so different to that of the wall that it's like two radio stations sharing the same space while never interfering with each other. I have seen ghosts do this myself. The apartness of people and objects is also an illusion. Everything is connected by the Field like all sea life is connected by the sea. It's just that within the limits of our visual reality we only 'see' holographic information and not the field of information that connects everything and from which the holographic world is made manifest. If you can only see holographic 'objects' and not the field that connects them they will appear to you as unconnected to each other in the same way that we see the computer while not seeing the Wi-Fi.

What you don't know *can* hurt you

Okay, we return to those 'two worlds' of human society and the Cult with its global network of interconnecting secret societies and satanic groups which manipulate through governments, corporations, media, religions, etc. The fundamental difference between them is *knowledge*. The idea has been to keep humanity

ignorant of the plan for its total enslavement underpinned by a crucial ignorance of reality – who we are and where we are – and how we interact with it. 'Human' should be the interaction between our expanded eternal consciousness and the five-sense body experience. We are meant to be *in* this world in terms of the five senses but not *of* this world in relation to our greater consciousness and perspective. In that state we experience the small picture of the five senses within the wider context of the big picture of awareness beyond the five senses. Put another way the five senses see the dots and expanded awareness connects them into pictures and patterns that give context to the apparently random and unconnected. Without the context of expanded awareness the five senses see only apartness and randomness with apparently no meaning. The Cult and its other-dimensional controllers seek to intervene in the frequency realm where five-sense reality is supposed to connect with expanded reality and to keep the two apart (more on this in the final chapter). When that happens five-sense mental and emotional processes are no longer influenced by expanded awareness, or the True 'I', and instead are driven by the isolated perceptions of the body's decoding systems. They are in the world *and* of it. Here we have the human plight and why humanity with its potential for infinite awareness can be so easily manipulatable and descend into such extremes of stupidity.

Once the Cult isolates five-sense mind from expanded awareness it can then program the mind with perceptions and beliefs by controlling information that the mind receives through the 'education' system of the formative years and the media perceptual bombardment and censorship of an entire lifetime. Limit perception and a sense of the possible through limiting knowledge by limiting and skewing information while censoring and discrediting that which could set people free. As the title of another of my books says *… And The Truth Shall Set You Free*. For this reason the last thing the Cult wants in circulation is the truth about anything – especially the reality of the eternal 'I' – and that's why it is desperate to control information. The Cult knows that information becomes perception

which becomes behaviour which, collectively, becomes human society. Cult-controlled and funded mainstream 'science' denies the existence of an eternal 'I' and seeks to dismiss and trash all evidence to the contrary. Cult-controlled mainstream religion has a version of 'God' that is little more than a system of control and dictatorship that employs threats of damnation in an afterlife to control perceptions and behaviour in the here and now through fear and guilt. Neither is true and it's the 'neither' that the Cult wishes to suppress. This 'neither' is that everything is an expression, a point of attention, within an infinite state of consciousness which is the real meaning of the term 'God'.

Perceptual obsession with the 'physical body' and five-senses means that 'God' becomes personified as a bearded bloke sitting among the clouds or a raging bully who loves us if we do what 'he' wants and condemns us to the fires of hell if we don't. These are no more than a 'spiritual' fairy tales to control and dictate events and behaviour through fear of this 'God' which has bizarrely made 'God-fearing' in religious circles a state to be desired. I would suggest that fearing *anything* is not to be encouraged and celebrated, but rather deleted. You can see why 'God fearing' is so beneficial to the Cult and its religions when *they* decide what 'God' wants and what 'God' demands (the Cult demands) that everyone do. As the great American comedian Bill Hicks said satirising a Christian zealot: 'I think what God meant to say.' How much of this infinite awareness ('God') that we access is decided by how far we choose to expand our perceptions, self-identity and sense of the possible. The scale of self-identity reflects itself in the scale of awareness that we can connect with and are influenced by – how much knowing and insight we have instead of programmed perception. You cannot expand your awareness into the infinity of possibility when you believe that you are little me Peter the postman or Mary in marketing and nothing more. I'll deal with this in the concluding chapter because it's crucial to how we turnaround current events.

Where the Cult came from

When I realised in the early 1990s there was a Cult network behind global events I asked the obvious question: When did it start? I took it back to ancient Rome and Egypt and on to Babylon and Sumer in Mesopotamia, the 'Land Between Two Rivers', in what we now call Iraq. The two rivers are the Tigris and Euphrates and this region is of immense historical and other importance to the Cult, as is the land called Israel only 550 miles away by air. There is much more going with deep esoteric meaning across this whole region. It's not only about 'wars for oil'. Priceless artefacts from Mesopotamia were stolen or destroyed after the American and British invasion of Iraq in 2003 justified by the lies of Boy Bush and Tony Blair (their Cult masters) about non-existent 'weapons of mass destruction'. Mesopotamia was the location of Sumer (about 5,400BC to 1,750BC), and Babylon (about 2,350BC to 539BC). Sabbatians may have become immensely influential in the Cult in modern times but they are part of a network that goes back into the mists of history. Sumer is said by historians to be the 'cradle of civilisation'. I disagree. I say it was the re-start of what we call human civilisation after cataclysmic events symbolised in part as the 'Great Flood' destroyed the world that existed before. These fantastic upheavals that I have been describing in detail in the books since the early1990s appear in accounts and legends of ancient cultures across the world and they are supported by geological and biological evidence. Stone tablets found in Iraq detailing the Sumer period say the cataclysms were caused by non-human 'gods' they call the Anunnaki. These are described in terms of extraterrestrial visitations in which knowledge supplied by the Anunnaki is said to have been the source of at least one of the world's oldest writing systems and developments in astronomy, mathematics and architecture that were way ahead of their time. I have covered this subject at length in *The Biggest Secret* and *Children of the Matrix* and the same basic 'Anunnaki' story can be found in Zulu accounts in South Africa where the late and very great Zulu high shaman Credo Mutwa told me that the Sumerian Anunnaki were known by Zulus as the Chitauri or 'children of the serpent'. See my six-hour video interview with Credo on this subject entitled *The*

Reptilian Agenda recorded at his then home near Johannesburg in 1999 which you can watch on the Ickonic media platform.

The Cult emerged out of Sumer, Babylon and Egypt (and elsewhere) and established the Roman Empire before expanding with the Romans into northern Europe from where many empires were savagely imposed in the form of Cult-controlled societies all over the world. Mass death and destruction was their calling card. The Cult established its centre of operations in Europe and European Empires were Cult empires which allowed it to expand into a global force. Spanish and Portuguese colonialists headed for Central and South America while the British and French targeted North America. Africa was colonised by Britain, France, Belgium, the Netherlands, Portugal, Spain, Italy, and Germany. Some like Britain and France moved in on the Middle East. The British Empire was by far the biggest for a simple reason. By now Britain was the headquarters of the Cult from which it expanded to form Canada, the United States, Australia and New Zealand. The Sun never set on the British Empire such was the scale of its occupation. London remains a global centre for the Cult along with Rome and the Vatican although others have emerged in Israel and China. It is no accident that the 'virus' is alleged to have come out of China while Italy was chosen as the means to terrify the Western population into compliance with 'Covid' fascism. Nor that Israel has led the world in 'Covid' fascism and mass 'vaccination'.

You would think that I would mention the United States here, but while it has been an important means of imposing the Cult's will it is less significant than would appear and is currently in the process of having what power it does have deleted. The Cult in Europe has mostly loaded the guns for the US to fire. America has been controlled from Europe from the start through Cult operatives in Britain and Europe. The American Revolution was an illusion to make it appear that America was governing itself while very different forces were pulling the strings in the form of Cult families such as the Rothschilds through the Rockefellers and other subordinates. The Rockefellers are extremely close to Bill Gates and

established both scalpel and drug 'medicine' and the World Health Organization. They play a major role in the development and circulation of vaccines through the Rockefeller Foundation on which Bill Gates said his Foundation is based. Why wouldn't this be the case when the Rockefellers and Gates are on the same team? Cult infiltration of human society goes way back into what we call history and has been constantly expanding and centralising power with the goal of establishing a global structure to dictate everything. Look how this has been advanced in great leaps with the 'Covid' hoax.

The non-human dimension

I researched and observed the comings and goings of Cult operatives through the centuries and even thousands of years as they were born, worked to promote the agenda within the secret society and satanic networks, and then died for others to replace them. Clearly there had to be a coordinating force that spanned this entire period while operatives who would not have seen the end goal in their lifetimes came and went advancing the plan over millennia. I went in search of that coordinating force with the usual support from the extraordinary synchronicity of my life which has been an almost daily experience since 1990. I saw common themes in religious texts and ancient cultures about a non-human force manipulating human society from the hidden. Christianity calls this force Satan, the Devil and demons; Islam refers to the Jinn or Djinn; Zulus have their Chitauri (spelt in other ways in different parts of Africa); and the Gnostic people in Egypt in the period around and before 400AD referred to this phenomena as the 'Archons', a word meaning rulers in Greek. Central American cultures speak of the 'Predators' among other names and the same theme is everywhere. I will use 'Archons' as a collective name for all of them. When you see how their nature and behaviour is described all these different sources are clearly talking about the same force. Gnostics described the Archons in terms of 'luminous fire' while Islam relates the Jinn to 'smokeless fire'. Some refer to beings in form that could occasionally be seen, but the most common of common theme is that they operate from

unseen realms which means almost all existence to the visual processes of humans. I had concluded that this was indeed the foundation of human control and that the Cult was operating within the human frequency band on behalf of this hidden force when I came across the writings of Gnostics which supported my conclusions in the most extraordinary way.

A sealed earthen jar was found in 1945 near the town of Nag Hammadi about 75-80 miles north of Luxor on the banks of the River Nile in Egypt. Inside was a treasure trove of manuscripts and texts left by the Gnostic people some 1,600 years earlier. They included 13 leather-bound papyrus codices (manuscripts) and more than 50 texts written in Coptic Egyptian estimated to have been hidden in the jar in the period of 400AD although the source of the information goes back much further. Gnostics oversaw the Great or Royal Library of Alexandria, the fantastic depository of ancient texts detailing advanced knowledge and accounts of human history. The Library was dismantled and destroyed in stages over a long period with the death-blow delivered by the Cult-established Roman Church in the period around 415AD. The Church of Rome was the Church of Babylon relocated as I said earlier. Gnostics were not a race. They were a way of perceiving reality. Whenever they established themselves and their information circulated the terrorists of the Church of Rome would target them for destruction. This happened with the Great Library and with the Gnostic Cathars who were burned to death by the psychopaths after a long period of oppression at the siege of the Castle of Monségur in southern France in 1244. The Church has always been terrified of Gnostic information which demolishes the official Christian narrative although there is much in the Bible that supports the Gnostic view if you read it in another way. To anyone studying the texts of what became known as the Nag Hammadi Library it is clear that great swathes of Christian and Biblical belief has its origin with Gnostics sources going back to Sumer. Gnostic themes have been twisted to manipulate the perceived reality of Bible believers. Biblical texts have been in the open for centuries where they could be changed while Gnostic

documents found at Nag Hammadi were sealed away and untouched for 1,600 years. What you see is what they wrote.

Use your *pneuma* not your *nous*

Gnosticism and Gnostic come from 'gnosis' which means knowledge, or rather *secret* knowledge, in the sense of spiritual awareness – knowledge about reality and life itself. The desperation of the Cult's Church of Rome to destroy the Gnostics can be understood when the knowledge they were circulating was the last thing the Cult wanted the population to know. Sixteen hundred years later the same Cult is working hard to undermine and silence me for the same reason. The dynamic between knowledge and ignorance is a constant. 'Time' appears to move on, but essential themes remain the same. We are told to 'use your nous', a Gnostic word for head/brain/intelligence. They said, however, that spiritual awakening or 'salvation' could only be secured by expanding awareness *beyond* what they called *nous* and into *pneuma* or Infinite Self. Obviously as I read these texts the parallels with what I have been saying since 1990 were fascinating to me. There is a universal truth that spans human history and in that case why wouldn't we be talking the same language 16 centuries apart? When you free yourself from the perception program of the five senses and explore expanded realms of consciousness you are going to connect with the same information no matter what the perceived 'era' within a manufactured timeline of a single and tiny range of manipulated frequency. Humans working with 'smart' technology or knocking rocks together in caves is only a timeline appearing to operate within the human frequency band. Expanded awareness and the knowledge it holds have always been there whether the era be Stone Age or computer age. We can only access that knowledge by opening ourselves to its frequency which the five-sense prison cell is designed to stop us doing. Gates, Fauci, Whitty, Vallance, Zuckerberg, Brin, Page, Wojcicki, Bezos, and all the others behind the 'Covid' hoax clearly have a long wait before their range of frequency can make that connection given that an open heart is

crucial to that as we shall see. Instead of accessing knowledge directly through expanded awareness it is given to Cult operatives by the secret society networks of the Cult where it has been passed on over thousands of years outside the public arena. Expanded realms of consciousness is where great artists, composers and writers find their inspiration and where truth awaits anyone open enough to connect with it. We need to go there fast.

Archon hijack

A fifth of the Nag Hammadi texts describe the existence and manipulation of the Archons led by a 'Chief Archon' they call 'Yaldabaoth', or the 'Demiurge', and this is the Christian 'Devil', 'Satan', 'Lucifer', and his demons. Archons in Biblical symbolism are the 'fallen ones' which are also referred to as fallen angels after the angels expelled from heaven according to the Abrahamic religions of Judaism, Christianity and Islam. These angels are claimed to tempt humans to 'sin' ongoing and you will see how accurate that symbolism is during the rest of the book. The theme of 'original sin' is related to the 'Fall' when Adam and Eve were 'tempted by the serpent' and fell from a state of innocence and 'obedience' (connection) with God into a state of disobedience (disconnection). The Fall is said to have brought sin into the world and corrupted everything including human nature. Yaldabaoth, the 'Lord Archon', is described by Gnostics as a 'counterfeit spirit', 'The Blind One', 'The Blind God', and 'The Foolish One'. The Jewish name for Yaldabaoth in Talmudic writings is Samael which translates as 'Poison of God', or 'Blindness of God'. You see the parallels. Yaldabaoth in Islamic belief is the Muslim Jinn devil known as Shaytan – Shaytan is Satan as the same themes are found all over the world in every religion and culture. The 'Lord God' of the Old Testament is the 'Lord Archon' of Gnostic manuscripts and that's why he's such a bloodthirsty bastard. Satan is known by Christians as 'the Demon of Demons' and Gnostics called Yaldabaoth the 'Archon of Archons'. Both are known as 'The Deceiver'. We are talking about the same 'bloke' for sure and these common themes

using different names, storylines and symbolism tell a common tale of the human plight.

Archons are referred to in Nag Hammadi documents as mind parasites, inverters, guards, gatekeepers, detainers, judges, pitiless ones and deceivers. The 'Covid' hoax alone is a glaring example of all these things. The Biblical 'God' is so different in the Old and New Testaments because they are not describing the same phenomenon. The vindictive, angry, hate-filled, 'God' of the Old Testament, known as Yahweh, is Yaldabaoth who is depicted in Cult-dictated popular culture as the 'Dark Lord', 'Lord of Time', Lord (Darth) Vader and Dormammu, the evil ruler of the 'Dark Dimension' trying to take over the 'Earth Dimension' in the Marvel comic movie, *Dr Strange*. Yaldabaoth is both the Old Testament 'god' and the Biblical 'Satan'. Gnostics referred to Yaldabaoth as the 'Great Architect of the Universe'and the Cult-controlled Freemason network calls their god 'the 'Great Architect of the Universe' (also Grand Architect). The 'Great Architect' Yaldabaoth is symbolised by the Cult as the all-seeing eye at the top of the pyramid on the Great Seal of the United States and the dollar bill. Archon is encoded in *arch*-itect as it is in *arch*-angels and *arch*-bishops. All religions have the theme of a force for good and force for evil in some sort of spiritual war and there is a reason for that – the theme is true. The Cult and its non-human masters are quite happy for this to circulate. They present themselves as the force for good fighting evil when they are really the force of evil (absence of love). The whole foundation of Cult modus operandi is inversion. They promote themselves as a force for good and anyone challenging them in pursuit of peace, love, fairness, truth and justice is condemned as a satanic force for evil. This has been the game plan throughout history whether the Church of Rome inquisitions of non-believers or 'conspiracy theorists' and 'anti-vaxxers' of today. The technique is the same whatever the timeline era.

Yaldabaoth is revolting (true)

Yaldabaoth and the Archons are said to have revolted against God with Yaldabaoth claiming to *be* God – the *All That Is*. The Old Testament 'God' (Yaldabaoth) demanded to be worshipped as such: ' *I am* the LORD, and there is none else, there is no God beside me' (Isaiah 45:5). I have quoted in other books a man who said he was the unofficial son of the late Baron Philippe de Rothschild of the Mouton-Rothschild wine producing estates in France who died in 1988 and he told me about the Rothschild 'revolt from God'. The man said he was given the name Phillip Eugene de Rothschild and we shared long correspondence many years ago while he was living under another identity. He said that he was conceived through 'occult incest' which (within the Cult) was 'normal and to be admired'. 'Phillip' told me about his experience attending satanic rituals with rich and famous people whom he names and you can see them and the wider background to Cult Satanism in my other books starting with *The Biggest Secret*. Cult rituals are interactions with Archontic 'gods'. 'Phillip' described Baron Philippe de Rothschild as 'a master Satanist and hater of God' and he used the same term 'revolt from God' associated with Yaldabaoth/Satan/Lucifer/the Devil in describing the Sabbatian Rothschild dynasty. 'I played a key role in my family's revolt from God', he said. That role was to infiltrate in classic Sabbatian style the Christian Church, but eventually he escaped the mind-prison to live another life. The Cult has been targeting religion in a plan to make worship of the Archons the global one-world religion. Infiltration of Satanism into modern 'culture', especially among the young, through music videos, stage shows and other means, is all part of this.

Nag Hammadi texts describe Yaldabaoth and the Archons in their prime form as energy – consciousness – and say they can take form if they choose in the same way that consciousness takes form as a human. Yaldabaoth is called 'formless' and represents a deeply inverted, distorted and chaotic state of consciousness which seeks to attached to humans and turn them into a likeness of itself in an attempt at assimilation. For that to happen it has to manipulate

humans into low frequency mental and emotional states that match its own. Archons can certainly appear in human form and this is the origin of the psychopathic personality. The energetic distortion Gnostics called Yaldabaoth *is* psychopathy. When psychopathic Archons take human form that human will be a psychopath as an expression of Yaldabaoth consciousness. Cult psychopaths are Archons in human form. The principle is the same as that portrayed in the 2009 *Avatar* movie when the American military travelled to a fictional Earth-like moon called Pandora in the Alpha Centauri star system to infiltrate a society of blue people, or Na'vi, by hiding within bodies that looked like the Na'vi. Archons posing as humans have a particular hybrid information field, part human, part Archon, (the ancient 'demigods') which processes information in a way that manifests behaviour to match their psychopathic evil, lack of empathy and compassion, and stops them being influenced by the empathy, compassion and love that a fully-human information field is capable of expressing. Cult bloodlines interbreed, be they royalty or dark suits, for this reason and you have their obsession with incest. Interbreeding with full-blown humans would dilute the Archontic energy field that guarantees psychopathy in its representatives in the human realm.

Gnostic writings say the main non-human forms that Archons take are *serpentine* (what I have called for decades 'reptilian' amid unbounded ridicule from the Archontically-programmed) and what Gnostics describe as 'an unborn baby or foetus with grey skin and dark, unmoving eyes'. This is an excellent representation of the ET 'Greys' of UFO folklore which large numbers of people claim to have seen and been abducted by – Zulu shaman Credo Mutwa among them. I agree with those that believe in extraterrestrial or interdimensional visitations today and for thousands of years past. No wonder with their advanced knowledge and technological capability they were perceived and worshipped as gods for technological and other 'miracles' they appeared to perform. Imagine someone arriving in a culture disconnected from the modern world with a smartphone and computer. They would be

seen as a 'god' capable of 'miracles'. The Renegade Mind, however, wants to know the source of everything and not only the way that source manifests as human or non-human. In the same way that a Renegade Mind seeks the original source material for the 'Covid virus' to see if what is claimed is true. The original source of Archons in form is consciousness – the distorted state of consciousness known to Gnostics as Yaldabaoth.

'Revolt from God' is energetic disconnection

Where I am going next will make a lot of sense of religious texts and ancient legends relating to 'Satan', Lucifer' and the 'gods'. Gnostic descriptions sync perfectly with the themes of my own research over the years in how they describe a consciousness distortion seeking to impose itself on human consciousness. I've referred to the core of infinite awareness in previous books as Infinite Awareness in Awareness of Itself. By that I mean a level of awareness that knows that it is all awareness and is aware of all awareness. From here comes the frequency of love in its true sense and balance which is what love is on one level – the balance of all forces into a single whole called Oneness and Isness. The more we disconnect from this state of love that many call 'God' the constituent parts of that Oneness start to unravel and express themselves as a part and not a whole. They become individualised as intellect, mind, selfishness, hatred, envy, desire for power over others, and such like. This is not a problem in the greater scheme in that 'God', the *All That Is*, can experience all these possibilities through different expressions of itself including humans. What we as expressions of the whole experience the *All That Is* experiences. We are the *All That Is* experiencing itself. As we withdraw from that state of Oneness we disconnect from its influence and things can get very unpleasant and very stupid. Archontic consciousness is at the extreme end of that. It has so disconnected from the influence of Oneness that it has become an inversion of unity and love, an inversion of everything, an inversion of life itself. Evil is appropriately live written backwards. Archontic consciousness is obsessed with death, an inversion of life,

and so its manifestations in Satanism are obsessed with death. They use inverted symbols in their rituals such as the inverted pentagram and cross. Sabbatians as Archontic consciousness incarnate invert Judaism and every other religion and culture they infiltrate. They seek disunity and chaos and they fear unity and harmony as they fear love like garlic to a vampire. As a result the Cult, Archons incarnate, act with such evil, psychopathy and lack of empathy and compassion disconnected as they are from the source of love. How could Bill Gates and the rest of the Archontic psychopaths do what they have to human society in the 'Covid' era with all the death, suffering and destruction involved and have no emotional consequence for the impact on others? Now you know. Why have Zuckerberg, Brin, Page, Wojcicki and company callously censored information warning about the dangers of the 'vaccine' while thousands have been dying and having severe, sometimes life-changing reactions? Now you know. Why have Tedros, Fauci, Whitty, Vallance and their like around the world been using case and death figures they're aware are fraudulent to justify lockdowns and all the deaths and destroyed lives that have come from that? Now you know. Why did Christian Drosten produce and promote a 'testing' protocol that he knew couldn't test for infectious disease which led to a global human catastrophe. Now you know. The Archontic mind doesn't give a shit (Fig 17). I personally think that Gates and major Cult insiders are a form of AI cyborg that the Archons want humans to become.

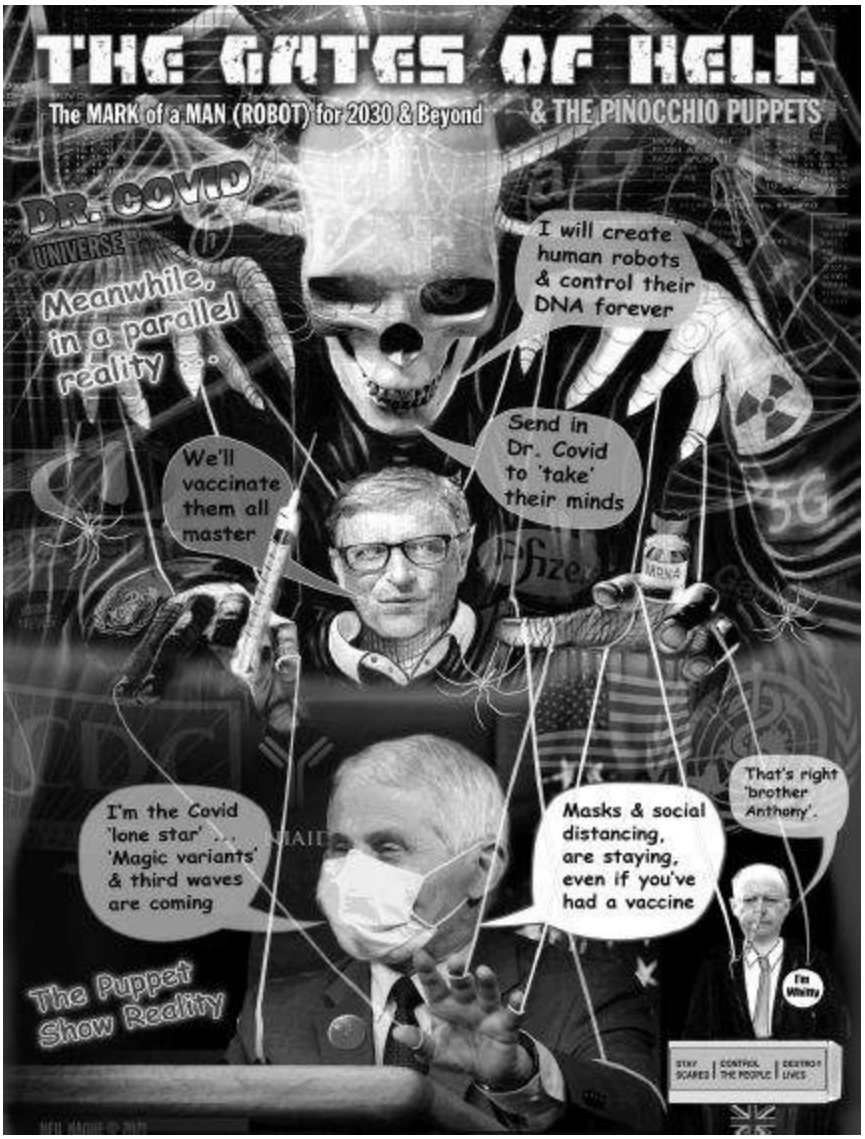

Figure 17: Artist Neil Hague's version of the 'Covid' hierarchy.

Human batteries

A state of such inversion does have its consequences, however. The level of disconnection from the Source of All means that you withdraw from that source of energetic sustenance and creativity. This means that you have to find your own supply of energetic power and it has – *us*. When the Morpheus character in the first *Matrix* movie held up a battery he spoke a profound truth when he said: 'The Matrix is a computer-generated dream world built to keep us under control in order to change the human being into one of

these.' The statement was true in all respects. We do live in a technologically-generated virtual reality simulation (more very shortly) and we have been manipulated to be an energy source for Archontic consciousness. The Disney-Pixar animated movie *Monsters, Inc*. in 2001 symbolised the dynamic when monsters in their world had no energy source and they would enter the human world to terrify children in their beds, catch the child's scream, terror (low-vibrational frequencies), and take that energy back to power the monster world. The lead character you might remember was a single giant eye and the symbolism of the Cult's all-seeing eye was obvious. Every thought and emotion is broadcast as a frequency unique to that thought and emotion. Feelings of love and joy, empathy and compassion, are high, quick, frequencies while fear, depression, anxiety, suffering and hate are low, slow, dense frequencies. Which kind do you think Archontic consciousness can connect with and absorb? In such a low and dense frequency state there's no way it can connect with the energy of love and joy. Archons can only feed off energy compatible with their own frequency and they and their Cult agents want to delete the human world of love and joy and manipulate the transmission of low vibrational frequencies through low-vibrational human mental and emotional states. *We are their energy source*. Wars are energetic banquets to the Archons – a world war even more so – and think how much low-frequency mental and emotional energy has been generated from the consequences for humanity of the 'Covid' hoax orchestrated by Archons incarnate like Gates.

The ancient practice of human sacrifice 'to the gods', continued in secret today by the Cult, is based on the same principle. 'The gods' are Archontic consciousness in different forms and the sacrifice is induced into a state of intense terror to generate the energy the Archontic frequency can absorb. Incarnate Archons in the ritual drink the blood which contains an adrenaline they crave which floods into the bloodstream when people are terrorised. Most of the sacrifices, ancient and modern, are children and the theme of 'sacrificing young virgins to the gods' is just code for children. They

have a particular pre-puberty energy that Archons want more than anything and the energy of the young in general is their target. The California Department of Education wants students to chant the names of Aztec gods (Archontic gods) once worshipped in human sacrifice rituals in a curriculum designed to encourage them to 'challenge racist, bigoted, discriminatory, imperialist/colonial beliefs', join 'social movements that struggle for social justice', and 'build new possibilities for a post-racist, post-systemic racism society'. It's the usual Woke crap that inverts racism and calls it anti-racism. In this case solidarity with 'indigenous tribes' is being used as an excuse to chant the names of 'gods' to which people were sacrificed (and still are in secret). What an example of Woke's inability to see beyond black and white, us and them, They condemn the colonisation of these tribal cultures by Europeans (quite right), but those cultures sacrificing people including children to their 'gods', and mass murdering untold numbers as the Aztecs did, is just fine. One chant is to the Aztec god Tezcatlipoca who had a man sacrificed to him in the 5th month of the Aztec calendar. His heart was cut out and he was eaten. Oh, that's okay then. Come on children … after three … Other sacrificial 'gods' for the young to chant their allegiance include Quetzalcoatl, Huitzilopochtli and Xipe Totec. The curriculum says that 'chants, affirmations, and energizers can be used to bring the class together, build unity around ethnic studies principles and values, and to reinvigorate the class following a lesson that may be emotionally taxing or even when student engagement may appear to be low'. Well, that's the cover story, anyway. Chanting and mantras are the repetition of a particular frequency generated from the vocal cords and chanting the names of these Archontic 'gods' tunes you into their frequency. That is the last thing you want when it allows for energetic synchronisation, attachment and perceptual influence. Initiates chant the names of their 'Gods' in their rituals for this very reason.

Vampires of the Woke

Paedophilia is another way that Archons absorb the energy of children. Paedophiles possessed by Archontic consciousness are used as the conduit during sexual abuse for discarnate Archons to vampire the energy of the young they desire so much. Stupendous numbers of children disappear every year never to be seen again although you would never know from the media. Imagine how much low-vibrational energy has been generated by children during the 'Covid' hoax when so many have become depressed and psychologically destroyed to the point of killing themselves. Shocking numbers of children are now taken by the state from loving parents to be handed to others. I can tell you from long experience of researching this since 1996 that many end up with paedophiles and assets of the Cult through corrupt and Cult-owned social services which in the reframing era has hired many psychopaths and emotionless automatons to do the job. Children are even stolen to order using spurious reasons to take them by the corrupt and secret (because they're corrupt) 'family courts'. I have written in detail in other books, starting with *The Biggest Secret* in 1997, about the ubiquitous connections between the political, corporate, government, intelligence and military elites (Cult operatives) and Satanism and paedophilia. If you go deep enough both networks have an interlocking leadership. The Woke mentality has been developed by the Cult for many reasons: To promote almost every aspect of its agenda; to hijack the traditional political left and turn it fascist; to divide and rule; and to target agenda pushbackers. But there are other reasons which relate to what I am describing here. How many happy and joyful Wokers do you ever see especially at the extreme end? They are a mental and psychological mess consumed by emotional stress and constantly emotionally cocked for the next explosion of indignation at someone referring to a female as a female. They are walking, talking, batteries as Morpheus might say emitting frequencies which both enslave them in low-vibrational bubbles of perceptual limitation and feed the Archons. Add to this the hatred claimed to be love; fascism claimed to 'anti-fascism', racism claimed to be 'anti-racism';

exclusion claimed to inclusion; and the abuse-filled Internet trolling. You have a purpose-built Archontic energy system with not a wind turbine in sight and all founded on Archontic *inversion*. We have whole generations now manipulated to serve the Archons with their actions and energy. They will be doing so their entire adult lives unless they snap out of their Archon-induced trance. Is it really a surprise that Cult billionaires and corporations put so much money their way? Where is the energy of joy and laughter, including laughing at yourself which is confirmation of your own emotional security? Mark Twain said: 'The human race has one really effective weapon, and that is laughter.' We must use it all the time. Woke has destroyed comedy because it has no humour, no joy, sense of irony, or self-deprecation. Its energy is dense and intense. *Mmmmm*, lunch says the Archontic frequency. Rudolf Steiner (1861-1925) was the Austrian philosopher and famous esoteric thinker who established Waldorf education or Steiner schools to treat children like unique expressions of consciousness and not minds to be programmed with the perceptions determined by authority. I'd been writing about this energy vampiring for decades when I was sent in 2016 a quote by Steiner. He was spot on:

> There are beings in the spiritual realms for whom anxiety and fear emanating from human beings offer welcome food. When humans have no anxiety and fear, then these creatures starve. If fear and anxiety radiates from people and they break out in panic, then these creatures find welcome nutrition and they become more and more powerful. These beings are hostile towards humanity. Everything that feeds on negative feelings, on anxiety, fear and superstition, despair or doubt, are in reality hostile forces in super-sensible worlds, launching cruel attacks on human beings, while they are being fed ... These are exactly the feelings that belong to contemporary culture and materialism; because it estranges people from the spiritual world, it is especially suited to evoke hopelessness and fear of the unknown in people, thereby calling up the above mentioned hostile forces against them.

Pause for a moment from this perspective and reflect on what has happened in the world since the start of 2020. Not only will pennies drop, but billion dollar bills. We see the same theme from Don Juan Matus, a Yaqui Indian shaman in Mexico and the information source for Peruvian-born writer, Carlos Castaneda, who wrote a series of

books from the 1960s to 1990s. Don Juan described the force manipulating human society and his name for the Archons was the predator:

> We have a predator that came from the depths of the cosmos and took over the rule of our lives. Human beings are its prisoners. The predator is our lord and master. It has rendered us docile, helpless. If we want to protest, it suppresses our protest. If we want to act independently, it demands that we don't do so ... indeed we are held prisoner!
>
> They took us over because we are food to them, and they squeeze us mercilessly because we are their sustenance. Just as we rear chickens in coops, the predators rear us in human coops, humaneros. Therefore, their food is always available to them.
>
> Different cultures, different eras, same recurring theme.

The 'ennoia' dilemma

Nag Hammadi Gnostic manuscripts say that Archon consciousness has no 'ennoia'. This is directly translated as 'intentionality', but I'll use the term 'creative imagination'. The *All That Is* in awareness of itself is the source of all creativity – all possibility – and the more disconnected you are from that source the more you are subsequently denied 'creative imagination'. Given that Archon consciousness is almost entirely disconnected it severely lacks creativity and has to rely on far more mechanical processes of thought and exploit the creative potential of those that do have 'ennoia'. You can see cases of this throughout human society. Archon consciousness almost entirely dominates the global banking system and if we study how that system works you will appreciate what I mean. Banks manifest 'money' out of nothing by issuing lines of 'credit' which is 'money' that has never, does not, and will never exist except in theory. It's a confidence trick. If you think 'credit' figures-on-a-screen 'money' is worth anything you accept it as payment. If you don't then the whole system collapses through lack of confidence in the value of that 'money'. Archontic bankers with no 'ennoia' are 'lending' 'money' that doesn't exist to humans that *do* have creativity – those that have the inspired ideas and create businesses and products. Archon banking feeds off human creativity

which it controls through 'money' creation and debt. Humans have the creativity and Archons exploit that for their own benefit and control while having none themselves. Archon Internet platforms like Facebook claim joint copyright of everything that creative users post and while Archontic minds like Zuckerberg may officially head that company it will be human creatives on the staff that provide the creative inspiration. When you have limitless 'money' you can then buy other companies established by creative humans. Witness the acquisition record of Facebook, Google and their like. Survey the Archon-controlled music industry and you see non-creative dark suit executives making their fortune from the human creativity of their artists. The cases are endless. Research the history of people like Gates and Zuckerberg and how their empires were built on exploiting the creativity of others. Archon minds cannot create out of nothing, but they are skilled (because they have to be) in what Gnostic texts call 'countermimicry'. They can imitate, but not innovate. Sabbatians trawl the creativity of others through backdoors they install in computer systems through their cybersecurity systems. Archon-controlled China is globally infamous for stealing intellectual property and I remember how Hong Kong, now part of China, became notorious for making counterfeit copies of the creativity of others – 'countermimicry'. With the now pervasive and all-seeing surveillance systems able to infiltrate any computer you can appreciate the potential for Archons to vampire the creativity of humans. Author John Lamb Lash wrote in his book about the Nag Hammadi texts, *Not In His Image*:

> Although they cannot originate anything, because they lack the divine factor of ennoia (intentionality), Archons can imitate with a vengeance. Their expertise is simulation (HAL, virtual reality). The Demiurge [Yaldabaoth] fashions a heaven world copied from the fractal patterns [of the original] ... His construction is celestial kitsch, like the fake Italianate villa of a Mafia don complete with militant angels to guard every portal.

This brings us to something that I have been speaking about since the turn of the millennium. Our reality is a simulation; a virtual reality that we think is real. No, I'm not kidding.

Human reality? Well, virtually

I had pondered for years about whether our reality is 'real' or some kind of construct. I remembered being immensely affected on a visit as a small child in the late 1950s to the then newly-opened Planetarium on the Marylebone Road in London which is now closed and part of the adjacent Madame Tussauds wax museum. It was in the middle of the day, but when the lights went out there was the night sky projected in the Planetarium's domed ceiling and it appeared to be so real. The experience never left me and I didn't know why until around the turn of the millennium when I became certain that our 'night sky' and entire reality is a projection, a virtual reality, akin to the illusory world portrayed in the *Matrix* movies. I looked at the sky one day in this period and it appeared to me like the domed roof of the Planetarium. The release of the first *Matrix* movie in 1999 also provided a synchronistic and perfect visual representation of where my mind had been going for a long time. I hadn't come across the Gnostic Nag Hammadi texts then. When I did years later the correlation was once again astounding. As I read Gnostic accounts from 1,600 years and more earlier it was clear that they were describing the same simulation phenomenon. They tell how the Yaldabaoth 'Demiurge' and Archons created a 'bad copy' of original reality to rule over all that were captured by its illusions and the body was a prison to trap consciousness in the 'bad copy' fake reality. Read how Gnostics describe the 'bad copy' and update that to current times and they are referring to what we would call today a virtual reality simulation.

Author John Lamb Lash said 'the Demiurge fashions a heaven world copied from the fractal patterns' of the original through expertise in 'HAL' or virtual reality simulation. Fractal patterns are part of the energetic information construct of our reality, a sort of blueprint. If these patterns were copied in computer terms it would indeed give you a copy of a 'natural' reality in a non-natural frequency and digital form. The principle is the same as making a copy of a website. The original website still exists, but now you can change the copy version to make it whatever you like and it can

become very different to the original website. Archons have done this with our reality, a *synthetic* copy of prime reality that still exists beyond the frequency walls of the simulation. Trapped within the illusions of this synthetic Matrix, however, were and are human consciousness and other expressions of prime reality and this is why the Archons via the Cult are seeking to make the human body synthetic and give us synthetic AI minds to complete the job of turning the entire reality synthetic including what we perceive to be the natural world. To quote Kurzweil: 'Nanobots will infuse all the matter around us with information. Rocks, trees, everything will become these intelligent creatures.' Yes, *synthetic* 'creatures' just as 'Covid' and other genetically-manipulating 'vaccines' are designed to make the human body synthetic. From this perspective it is obvious why Archons and their Cult are so desperate to infuse synthetic material into every human with their 'Covid' scam.

Let there be (electromagnetic) light

Yaldabaoth, the force that created the simulation, or Matrix, makes sense of the Gnostic reference to 'The Great Architect' and its use by Cult Freemasonry as the name of its deity. The designer of the Matrix in the movies is called 'The Architect' and that trilogy is jam-packed with symbolism relating to these subjects. I have contended for years that the angry Old Testament God (Yaldabaoth) is the 'God' being symbolically 'quoted' in the opening of Genesis as 'creating the world'. This is not the creation of prime reality – it's the creation of the *simulation*. The Genesis 'God' says: 'Let there be Light: and there was light.' But what is this 'Light'? I have said for decades that the speed of light (186,000 miles per second) is not the fastest speed possible as claimed by mainstream science and is in fact the frequency walls or outer limits of the Matrix. You can't have a fastest or slowest anything within all possibility when everything is possible. The human body is encoded to operate within the speed of light or *within the simulation* and thus we see only the tiny frequency band of visible *light*. Near-death experiencers who perceive reality outside the body during temporary 'death' describe a very different

form of light and this is supported by the Nag Hammadi texts. Prime reality beyond the simulation ('Upper Aeons' to the Gnostics) is described as a realm of incredible beauty, bliss, love and harmony – a realm of 'watery light' that is so powerful 'there are no shadows'. Our false reality of Archon control, which Gnostics call the 'Lower Aeons', is depicted as a realm with a different kind of 'light' and described in terms of chaos, 'Hell', 'the Abyss' and 'Outer Darkness', where trapped souls are tormented and manipulated by demons (relate that to the 'Covid' hoax alone). The watery light theme can be found in near-death accounts and it is not the same as *simulation* 'light' which is electromagnetic or radiation light within the speed of light – the 'Lower Aeons'. Simulation 'light' is the 'luminous fire' associated by Gnostics with the Archons. The Bible refers to Yaldabaoth as 'that old serpent, called the Devil, and Satan, which deceiveth the whole world' (Revelation 12:9). I think that making a simulated copy of prime reality ('countermimicry') and changing it dramatically while all the time manipulating humanity to believe it to be real could probably meet the criteria of deceiving the whole world. Then we come to the Cult god Lucifer – the *Light Bringer*. Lucifer is symbolic of Yaldabaoth, the bringer of radiation light that forms the bad copy simulation within the speed of light. 'He' is symbolised by the lighted torch held by the Statue of Liberty and in the name 'Illuminati'. Sabbatian-Frankism declares that Lucifer is the true god and Lucifer is the real god of Freemasonry honoured as their 'Great or Grand Architect of the Universe' (simulation).

I would emphasise, too, the way Archontic technologically-generated luminous fire of radiation has deluged our environment since I was a kid in the 1950s and changed the nature of The Field with which we constantly interact. Through that interaction technological radiation is changing us. The Smart Grid is designed to operate with immense levels of communication power with 5G expanding across the world and 6G, 7G, in the process of development. Radiation is the simulation and the Archontic manipulation system. Why wouldn't the Archon Cult wish to unleash radiation upon us to an ever-greater extreme to form

Kurzweil's 'cloud'? The plan for a synthetic human is related to the need to cope with levels of radiation beyond even anything we've seen so far. Biological humans would not survive the scale of radiation they have in their script. The Smart Grid is a technological sub-reality within the technological simulation to further disconnect five-sense perception from expanded consciousness. It's a technological prison of the mind.

Infusing the 'spirit of darkness'

A recurring theme in religion and native cultures is the manipulation of human genetics by a non-human force and most famously recorded as the biblical 'sons of god' (the god*s* plural in the original) who interbred with the daughters of men. The Nag Hammadi *Apocryphon of John* tells the same story this way:

> He [Yaldabaoth] sent his angels [Archons/demons] to the daughters of men, that they might take some of them for themselves and raise offspring for their enjoyment. And at first they did not succeed. When they had no success, they gathered together again and they made a plan together ... And the angels changed themselves in their likeness into the likeness of their mates, filling them with the spirit of darkness, which they had mixed for them, and with evil ... And they took women and begot children out of the darkness according to the likeness of their spirit.

Possession when a discarnate entity takes over a human body is an age-old theme and continues today. It's very real and I've seen it. Satanic and secret society rituals can create an energetic environment in which entities can attach to initiates and I've heard many stories of how people have changed their personality after being initiated even into lower levels of the Freemasons. I have been inside three Freemasonic temples, one at a public open day and two by just walking in when there was no one around to stop me. They were in Ryde, the town where I live, Birmingham, England, when I was with a group, and Boston, Massachusetts. They all felt the same energetically – dark, dense, low-vibrational and sinister. Demonic attachment can happen while the initiate has no idea what is going on. To them it's just a ritual to get in the Masons and do a bit of good

business. In the far more extreme rituals of Satanism human possession is even more powerful and they are designed to make possession possible. The hierarchy of the Cult is dictated by the power and perceived status of the possessing Archon. In this way the Archon hierarchy becomes the Cult hierarchy. Once the entity has attached it can influence perception and behaviour and if it attaches to the extreme then so much of its energy (information) infuses into the body information field that the hologram starts to reflect the nature of the possessing entity. This is the *Exorcist* movie type of possession when facial features change and it's known as shapeshifting. Islam's Jinn are said to be invisible tricksters who change shape, 'whisper', confuse and take human form. These are all traits of the Archons and other versions of the same phenomenon. Extreme possession could certainty infuse the 'spirit of darkness' into a partner during sex as the Nag Hammadi texts appear to describe. Such an infusion can change genetics which is also energetic information. Human genetics is information and the 'spirit of darkness' is information. Mix one with the other and change must happen. Islam has the concept of a 'Jinn baby' through possession of the mother and by Jinn taking human form. There are many ways that human genetics can be changed and remember that Archons have been aware all along of advanced techniques to do this. What is being done in human society today – and far more – was known about by Archons at the time of the 'fallen ones' and their other versions described in religions and cultures.

Archons and their human-world Cult are obsessed with genetics as we see today and they know this dictates how information is processed into perceived reality during a human life. They needed to produce a human form that would decode the simulation and this is symbolically known as 'Adam and Eve' who left the 'garden' (prime reality) and 'fell' into Matrix reality. The simulation is not a 'physical' construct (there is no 'physical'); it is a source of information. Think Wi-Fi again. The simulation is an energetic field encoded with information and body-brain systems are designed to decode that information encoded in wave or frequency form which

is transmitted to the brain as electrical signals. These are decoded by the brain to construct our sense of reality – an illusory 'physical' world that only exists in the brain or the mind. Virtual reality games mimic this process using the same sensory decoding system. Information is fed to the senses to decode a virtual reality that can appear so real, but isn't (Figs 18 and 19). Some scientists believe – and I agree with them – that what we perceive as 'physical' reality only exists when we are looking or observing. The act of perception or focus triggers the decoding systems which turn waveform information into holographic reality. When we are not observing something our reality reverts from a holographic state to a waveform state. This relates to the same principle as a falling tree not making a noise unless someone is there to hear it or decode it. The concept makes sense from the simulation perspective. A computer is not decoding all the information in a Wi-Fi field all the time and only decodes or brings into reality on the screen that part of Wi-Fi that it's decoding – focusing upon – at that moment.

Figure 18: Virtual reality technology 'hacks' into the body's five-sense decoding system.

Figure 19: The result can be experienced as very 'real'.

Interestingly, Professor Donald Hoffman at the Department of Cognitive Sciences at the University of California, Irvine, says that our experienced reality is like a computer interface that shows us only the level with which we interact while hiding all that exists beyond it: 'Evolution shaped us with a user interface that hides the truth. Nothing that we see is the truth – the very language of space and time and objects is the wrong language to describe reality.' He is correct in what he says on so many levels. Space and time are not a universal reality. They are a phenomenon of decoded *simulation* reality as part of the process of enslaving our sense of reality. Near-death experiencers report again and again how space and time did not exist as we perceive them once they were free of the body – body decoding systems. You can appreciate from this why Archons and their Cult are so desperate to entrap human attention in the five senses where we are in the Matrix and of the Matrix. Opening your mind to expanded states of awareness takes you beyond the information confines of the simulation and you become aware of knowledge and insights denied to you before. This is what we call 'awakening' – *awakening from the Matrix* – and in the final chapter I will relate this to current events.

Where are the 'aliens'?

A simulation would explain the so-called 'Fermi Paradox' named after Italian physicist Enrico Fermi (1901-1954) who created the first nuclear reactor. He considered the question of why there is such a lack of extraterrestrial activity when there are so many stars and planets in an apparently vast universe; but what if the night sky that we see, or think we do, is a simulated projection as I say? If you control the simulation and your aim is to hold humanity fast in essential ignorance would you want other forms of life including advanced life coming and going sharing information with humanity? Or would you want them to believe they were isolated and apparently alone? Themes of human isolation and apartness are common whether they be the perception of a lifeless universe or the fascist isolation laws of the 'Covid' era. Paradoxically the very

existence of a simulation means that we are not alone when some force had to construct it. My view is that experiences that people have reported all over the world for centuries with Reptilians and Grey entities are Archon phenomena as Nag Hammadi texts describe; and that benevolent 'alien' interactions are non-human groups that come in and out of the simulation by overcoming Archon attempts to keep them out. It should be highlighted, too, that Reptilians and Greys are obsessed with *genetics* and *technology* as related by cultural accounts and those who say they have been abducted by them. Technology is their way of overcoming some of the limitations in their creative potential and our technology-driven and controlled human society of today is *arch*etypical Archon-Reptilian-Grey modus operandi. Technocracy is really *Archon*tocracy. The Universe does not have to be as big as it appears with a simulation. There is no space or distance only information decoded into holographic reality. What we call 'space' is only the absence of holographic 'objects' and that 'space' is The Field of energetic information which connects everything into a single whole. The same applies with the artificially-generated information field of the simulation. The Universe is not big or small as a physical reality. It is decoded information, that's all, and its perceived size is decided by the way the simulation is encoded to make it appear. The entire night sky as we perceive it only exists in our brain and so where are those 'millions of light years'? The 'stars' on the ceiling of the Planetarium looked a vast distance away.

There's another point to mention about 'aliens'. I have been highlighting since the 1990s the plan to stage a fake 'alien invasion' to justify the centralisation of global power and a world military. Nazi scientist Werner von Braun, who was taken to America by Operation Paperclip after World War Two to help found NASA, told his American assistant Dr Carol Rosin about the Cult agenda when he knew he was dying in 1977. Rosin said that he told her about a sequence that would lead to total human control by a one-world government. This included threats from terrorism, rogue nations, meteors and asteroids before finally an 'alien invasion'. All of these

things, von Braun said, would be bogus and what I would refer to as a No-Problem-Reaction-Solution. Keep this in mind when 'the aliens are coming' is the new mantra. The aliens are not coming – they are *already here* and they have infiltrated human society while looking human. French-Canadian investigative journalist Serge Monast said in 1994 that he had uncovered a NASA/military operation called Project Blue Beam which fits with what Werner von Braun predicted. Monast died of a 'heart attack' in 1996 the day after he was arrested and spent a night in prison. He was 51. He said Blue Beam was a plan to stage an alien invasion that would include religious figures beamed holographically into the sky as part of a global manipulation to usher in a 'new age' of worshipping what I would say is the Cult 'god' Yaldabaoth in a one-world religion. Fake holographic asteroids are also said to be part of the plan which again syncs with von Braun. How could you stage an illusory threat from asteroids unless they were holographic inserts? This is pretty straightforward given the advanced technology outside the public arena and the fact that our 'physical' reality is holographic anyway. Information fields would be projected and we would decode them into the illusion of a 'physical' asteroid. If they can sell a global 'pandemic' with a 'virus' that doesn't exist what will humans not believe if government and media tell them?

All this is particularly relevant as I write with the Pentagon planning to release in June, 2021, information about 'UFO sightings'. I have been following the UFO story since the early 1990s and the common theme throughout has been government and military denials and cover up. More recently, however, the Pentagon has suddenly become more talkative and apparently open with Air Force pilot radar images released of unexplained craft moving and changing direction at speeds well beyond anything believed possible with human technology. Then, in March, 2021, former Director of National Intelligence John Ratcliffe said a Pentagon report months later in June would reveal a great deal of information about UFO sightings unknown to the public. He said the report would have 'massive implications'. The order to do this was included bizarrely

in a $2.3 trillion 'coronavirus' relief and government funding bill passed by the Trump administration at the end of 2020. I would add some serious notes of caution here. I have been pointing out since the 1990s that the US military and intelligence networks have long had craft – 'flying saucers' or anti-gravity craft – which any observer would take to be extraterrestrial in origin. Keeping this knowledge from the public allows craft flown by *humans* to be perceived as alien visitations. I am not saying that 'aliens' do not exist. I would be the last one to say that, but we have to be streetwise here. President Ronald Reagan told the UN General Assembly in 1987: 'I occasionally think how quickly our differences worldwide would vanish if we were facing an alien threat from outside this world.' That's the idea. Unite against a common 'enemy' with a common purpose behind your 'saviour force' (the Cult) as this age-old technique of mass manipulation goes global.

Science moves this way …

I could find only one other person who was discussing the simulation hypothesis publicly when I concluded it was real. This was Nick Bostrom, a Swedish-born philosopher at the University of Oxford, who has explored for many years the possibility that human reality is a computer simulation although his version and mine are not the same. Today the simulation and holographic reality hypothesis have increasingly entered the scientific mainstream. Well, the more open-minded mainstream, that is. Here are a few of the ever-gathering examples. American nuclear physicist Silas Beane led a team of physicists at the University of Bonn in Germany pursuing the question of whether we live in a simulation. They concluded that we probably do and it was likely based on a lattice of cubes. They found that cosmic rays align with that specific pattern. The team highlighted the Greisen–Zatsepin–Kuzmin (GZK) limit which refers to cosmic ray particle interaction with cosmic background radiation that creates an apparent boundary for cosmic ray particles. They say in a paper entitled 'Constraints on the Universe as a Numerical Simulation' that this 'pattern of constraint' is exactly what you

would find with a computer simulation. They also made the point that a simulation would create its own 'laws of physics' that would limit possibility. I've been making the same point for decades that the *perceived* laws of physics relate only to this reality, or what I would later call the simulation. When designers write codes to create computer and virtual reality games they are the equivalent of the laws of physics for that game. Players interact within the limitations laid out by the coding. In the same way those who wrote the codes for the simulation decided the laws of physics that would apply. These can be overridden by expanded states of consciousness, but not by those enslaved in only five-sense awareness where simulation codes rule. Overriding the codes is what people call 'miracles'. They are not. They are bypassing the encoded limits of the simulation. A population caught in simulation perception would have no idea that this was their plight. As the Bonn paper said: 'Like a prisoner in a pitch-black cell we would not be able to see the "walls" of our prison,' That's true if people remain mesmerised by the five senses. Open to expanded awareness and those walls become very clear. The main one is the speed of light.

American theoretical physicist James Gates is another who has explored the simulation question and found considerable evidence to support the idea. Gates was Professor of Physics at the University of Maryland, Director of The Center for String and Particle Theory, and on Barack Obama's Council of Advisors on Science and Technology. He and his team found *computer codes* of digital data embedded in the fabric of our reality. They relate to on-off electrical charges of 1 and 0 in the binary system used by computers. 'We have no idea what they are doing there', Gates said. They found within the energetic fabric mathematical sequences known as error-correcting codes or block codes that 'reboot' data to its original state or 'default settings' when something knocks it out of sync. Gates was asked if he had found a set of equations embedded in our reality indistinguishable from those that drive search engines and browsers and he said: 'That is correct.' Rich Terrile, director of the Centre for Evolutionary Computation and Automated Design at NASA's Jet

Propulsion Laboratory, has said publicly that he believes the Universe is a digital hologram that must have been created by a form of intelligence. I agree with that in every way. Waveform information is delivered electrically by the senses to the brain which constructs a *digital* holographic reality that we call the 'world'. This digital level of reality can be read by the esoteric art of numerology. Digital holograms are at the cutting edge of holographics today. We have digital technology everywhere designed to access and manipulate our digital level of perceived reality. Synthetic mRNA in 'Covid vaccines' has a digital component to manipulate the body's digital 'operating system'.

Reality is numbers

How many know that our reality can be broken down to numbers and codes that are the same as computer games? Max Tegmark, a physicist at the Massachusetts Institute of Technology (MIT), is the author of *Our Mathematical Universe* in which he lays out how reality can be entirely described by numbers and maths in the way that a video game is encoded with the 'physics' of computer games. Our world and computer virtual reality are essentially the same. Tegmark imagines the perceptions of characters in an advanced computer game when the graphics are so good they don't know they are in a game. They think they can bump into real objects (electromagnetic resistance in our reality), fall in love and feel emotions like excitement. When they began to study the apparently 'physical world' of the video game they would realise that everything was made of pixels (which have been found in our energetic reality as must be the case when on one level our world is digital). What computer game characters thought was physical 'stuff', Tegmark said, could actually be broken down into numbers:

> And we're exactly in this situation in our world. We look around and it doesn't seem that mathematical at all, but everything we see is made out of elementary particles like quarks and electrons. And what properties does an electron have? Does it have a smell or a colour or a texture? No! ... We physicists have come up with geeky names for [Electron] properties, like

electric charge, or spin, or lepton number, but the electron doesn't care what we call it, the properties are just numbers.

This is the illusory reality Gnostics were describing. This is the simulation. The A, C, G, and T codes of DNA have a binary value – A and C = 0 while G and T = 1. This has to be when the simulation is digital and the body must be digital to interact with it. Recurring mathematical sequences are encoded throughout reality and the body. They include the Fibonacci sequence in which the two previous numbers are added to get the next one, as in ... 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, etc. The sequence is encoded in the human face and body, proportions of animals, DNA, seed heads, pine cones, trees, shells, spiral galaxies, hurricanes and the number of petals in a flower. The list goes on and on. There are fractal patterns – a 'never-ending pattern that is infinitely complex and self-similar across all scales in the as above, so below, principle of holograms. These and other famous recurring geometrical and mathematical sequences such as Phi, Pi, Golden Mean, Golden Ratio and Golden Section are *computer codes* of the simulation. I had to laugh and give my head a shake the day I finished this book and it went into the production stage. I was sent an article in *Scientific American* published in April, 2021, with the headline 'Confirmed! We Live in a Simulation'. Two decades after I first said our reality is a simulation and the speed of light is it's outer limit the article suggested that we do live in a simulation and that the speed of light is its outer limit. I left school at 15 and never passed a major exam in my life while the writer was up to his eyes in qualifications. As I will explain in the final chapter *knowing* is far better than thinking and they come from very different sources. The article rightly connected the speed of light to the processing speed of the 'Matrix' and said what has been in my books all this time … 'If we are in a simulation, as it appears, then space is an abstract property written in code. It is not real'. No it's not and if we live in a simulation something created it and it wasn't *us*. 'That David Icke says we are manipulated by aliens' – he's crackers.'

Wow …

The reality that humanity thinks is so real is an illusion. Politicians, governments, scientists, doctors, academics, law enforcement, media, school and university curriculums, on and on, are all founded on a world that *does not exist* except as a simulated prison cell. Is it such a stretch to accept that 'Covid' doesn't exist when our entire 'physical' reality doesn't exist? Revealed here is the knowledge kept under raps in the Cult networks of compartmentalised secrecy to control humanity's sense of reality by inducing the population to believe in a reality that's not real. If it wasn't so tragic in its experiential consequences the whole thing would be hysterically funny. None of this is new to Renegade Minds. Ancient Greek philosopher Plato (about 428 to about 347BC) was a major influence on Gnostic belief and he described the human plight thousands of years ago with his Allegory of the Cave. He told the symbolic story of prisoners living in a cave who had never been outside. They were chained and could only see one wall of the cave while behind them was a fire that they could not see. Figures walked past the fire casting shadows on the prisoners' wall and those moving shadows became their sense of reality. Some prisoners began to study the shadows and were considered experts on them (today's academics and scientists), but what they studied was only an illusion (today's academics and scientists). A prisoner escaped from the cave and saw reality as it really is. When he returned to report this revelation they didn't believe him, called him mad and threatened to kill him if he tried to set them free. Plato's tale is not only a brilliant analogy of the human plight and our illusory reality. It describes, too, the dynamics of the 'Covid' hoax. I have only skimmed the surface of these subjects here. The aim of this book is to crisply connect all essential dots to put what is happening today into its true context. All subject areas and their connections in this chapter are covered in great evidential detail in *Everything You Need To Know, But Have Never Been Told* and *The Answer*.

They say that bewildered people 'can't see the forest for the trees'. Humanity, however, can't see the forest for the *twigs*. The five senses

see only twigs while Renegade Minds can see the forest and it's the forest where the answers lie with the connections that reveals. Breaking free of perceptual programming so the forest can be seen is the way we turn all this around. Not breaking free is how humanity got into this mess. The situation may seem hopeless, but I promise you it's not. We are a perceptual heartbeat from paradise if only we knew.

CHAPTER TWELVE

Escaping Wetiko

Life is simply a vacation from the infinite
Dean Cavanagh

Renegade Minds weave the web of life and events and see common themes in the apparently random. They are always there if you look for them and their pursuit is aided by incredible synchronicity that comes when your mind is open rather than mesmerised by what it thinks it can see.

Infinite awareness is infinite possibility and the more of infinite possibility that we access the more becomes infinitely possible. That may be stating the apparently obvious, but it is a devastatingly-powerful fact that can set us free. We are a point of attention within an infinity of consciousness. The question is how much of that infinity do we choose to access? How much knowledge, insight, awareness, wisdom, do we want to connect with and explore? If your focus is only in the five senses you will be influenced by a fraction of infinite awareness. I mean a range so tiny that it gives new meaning to infinitesimal. Limitation of self-identity and a sense of the possible limit accordingly your range of consciousness. We are what we think we are. Life is what we think it is. The dream is the dreamer and the dreamer is the dream. Buddhist philosophy puts it this way: 'As a thing is viewed, so it appears.' Most humans live in the realm of touch, taste, see, hear, and smell and that's the limit of their sense of the possible and sense of self. Many will follow a religion and speak of a God in his heaven, but their lives are still

dominated by the five senses in their perceptions and actions. The five senses become the arbiter of everything. When that happens all except a smear of infinity is sealed away from influence by the rigid, unyielding, reality bubbles that are the five-sense human or Phantom Self. Archon Cult methodology is to isolate consciousness within five-sense reality – the simulation – and then program that consciousness with a sense of self and the world through a deluge of life-long information designed to instil the desired perception that allows global control. Efforts to do this have increased dramatically with identity politics as identity bubbles are squeezed into the minutiae of five-sense detail which disconnect people even more profoundly from the infinite 'I'.

Five-sense focus and self-identity are like a firewall that limits access to the infinite realms. You only perceive one radio or television station and no other. We'll take that literally for a moment. Imagine a vast array of stations giving different information and angles on reality, but you only ever listen to one. Here we have the human plight in which the population is overwhelmingly confined to CultFM. This relates only to the frequency range of CultFM and limits perception and insight to that band – limits *possibility* to that band. It means you are connecting with an almost imperceptibly minuscule range of possibility and creative potential within the infinite Field. It's a world where everything seems apart from everything else and where synchronicity is rare. Synchronicity is defined in the dictionary as 'the happening by chance of two or more related or similar events at the same time'. Use of 'by chance' betrays a complete misunderstanding of reality. Synchronicity is not 'by chance'. As people open their minds, or 'awaken' to use the term, they notice more and more coincidences in their lives, bits of 'luck', apparently miraculous happenings that put them in the right place at the right time with the right people. Days become peppered with 'fancy meeting you here' and 'what are the chances of that?' My entire life has been lived like this and ever more so since my own colossal awakening in 1990 and 91 which transformed my sense of reality. Synchronicity is not 'by chance'; it is by accessing expanded

realms of possibility which allow expanded potential for manifestation. People broadcasting the same vibe from the same openness of mind tend to be drawn 'by chance' to each other through what I call frequency magnetism and it's not only people. In the last more than 30 years incredible synchronicity has also led me through the Cult maze to information in so many forms and to crucial personal experiences. These 'coincidences' have allowed me to put the puzzle pieces together across an enormous array of subjects and situations. Those who have breached the bubble of five-sense reality will know exactly what I mean and this escape from the perceptual prison cell is open to everyone whenever they make that choice. This may appear super-human when compared with the limitations of 'human', but it's really our natural state. 'Human' as currently experienced is consciousness in an unnatural state of induced separation from the infinity of the whole. I'll come to how this transformation into unity can be made when I have described in more detail the force that holds humanity in servitude by denying this access to infinite self.

The Wetiko factor

I have been talking and writing for decades about the way five-sense mind is systematically barricaded from expanded awareness. I have used the analogy of a computer (five-sense mind) and someone at the keyboard (expanded awareness). Interaction between the computer and the operator is symbolic of the interaction between five-sense mind and expanded awareness. The computer directly experiences the Internet and the operator experiences the Internet via the computer which is how it's supposed to be – the two working as one. Archons seek to control that point where the operator connects with the computer to stop that interaction (Fig 20). Now the operator is banging the keyboard and clicking the mouse, but the computer is not responding and this happens when the computer is taken over – *possessed* – by an appropriately-named computer 'virus'. The operator has lost all influence over the computer which goes its own way making decisions under the control of the 'virus'. I have

just described the dynamic through which the force known to Gnostics as Yaldabaoth and Archons disconnects five-sense mind from expanded awareness to imprison humanity in perceptual servitude.

Figure 20: The mind 'virus' I have been writing about for decades seeks to isolate five-sense mind (the computer) from the true 'I'. (Image by Neil Hague).

About a year ago I came across a Native American concept of Wetiko which describes precisely the same phenomenon. Wetiko is the spelling used by the Cree and there are other versions including wintiko and windigo used by other tribal groups. They spell the name with lower case, but I see Wetiko as a proper noun as with Archons and prefer a capital. I first saw an article about Wetiko by writer and researcher Paul Levy which so synced with what I had been writing about the computer/operator disconnection and later the Archons. I then read his book, the fascinating *Dispelling Wetiko, Breaking the Spell of Evil*. The parallels between what I had concluded long before and the Native American concept of Wetiko were so clear and obvious that it was almost funny. For Wetiko see the Gnostic Archons for sure and the Jinn, the Predators, and every other name for a force of evil, inversion and chaos. Wetiko is the Native American name for the force that divides the computer from

the operator (Fig 21). Indigenous author Jack D. Forbes, a founder of the Native American movement in the 1960s, wrote another book about Wetiko entitled *Columbus And Other Cannibals – The Wetiko Disease of Exploitation, Imperialism, and Terrorism* which I also read. Forbes says that Wetiko refers to an evil person or spirit 'who terrorizes other creatures by means of terrible acts, including cannibalism'. Zulu shaman Credo Mutwa told me that African accounts tell how cannibalism was brought into the world by the Chitauri 'gods' – another manifestation of Wetiko. The distinction between 'evil person or spirit' relates to Archons/Wetiko possessing a human or acting as pure consciousness. Wetiko is said to be a sickness of the soul or spirit and a state of being that takes but gives nothing back – the Cult and its operatives perfectly described. Black Hawk, a Native American war leader defending their lands from confiscation, said European invaders had 'poisoned hearts' – Wetiko hearts – and that this would spread to native societies. Mention of the heart is very significant as we shall shortly see. Forbes writes: 'Tragically, the history of the world for the past 2,000 years is, in great part, the story of the epidemiology of the wetiko disease.' Yes, and much longer. Forbes is correct when he says: 'The wetikos destroyed Egypt and Babylon and Athens and Rome and Tenochtitlan [capital of the Aztec empire] and perhaps now they will destroy the entire earth.' Evil, he said, is the number one export of a Wetiko culture – see its globalisation with 'Covid'. Constant war, mass murder, suffering of all kinds, child abuse, Satanism, torture and human sacrifice are all expressions of Wetiko and the Wetiko possessed. The world is Wetiko made manifest, *but it doesn't have to be*. There is a way out of this even now.

Figure 21: The mind 'virus' is known to Native Americans as 'Wetiko'. (Image by Neil Hague).

Cult of Wetiko

Wetiko is the Yaldabaoth frequency distortion that seeks to attach to human consciousness and absorb it into its own. Once this connection is made Wetiko can drive the perceptions of the target which they believe to be coming from their own mind. All the horrors of history and today from mass killers to Satanists, paedophiles like Jeffrey Epstein and other psychopaths, are the embodiment of Wetiko and express its state of being in all its grotesqueness. The Cult is Wetiko incarnate, Yaldabaoth incarnate, and it seeks to facilitate Wetiko assimilation of humanity in totality into its distortion by manipulating the population into low frequency states that match its own. Paul Levy writes: 'Holographically enforced within the psyche of every human being the wetiko virus pervades and underlies the entire field of consciousness, and can therefore potentially manifest through any one of us at any moment if we are not mindful.' The 'Covid' hoax has achieved this with many people, but others have not fallen into Wetiko's frequency lair. Players in the 'Covid' human catastrophe including Gates, Schwab, Tedros, Fauci, Whitty, Vallance, Johnson, Hancock, Ferguson, Drosten, and all the rest, including the psychopath psychologists, are expressions of Wetiko. This is why

they have no compassion or empathy and no emotional consequence for what they do that would make them stop doing it. Observe all the people who support the psychopaths in authority against the Pushbackers despite the damaging impact the psychopaths have on their own lives and their family's lives. You are again looking at Wetiko possession which prevents them seeing through the lies to the obvious scam going on. *Why can't they see it?* Wetiko won't let them see it. The perceptual divide that has now become a chasm is between the Wetikoed and the non-Wetikoed.

Paul Levy describes Wetiko in the same way that I have long described the Archontic force. They are the same distorted consciousness operating across dimensions of reality: '… the subtle body of wetiko is not located in the third dimension of space and time, literally existing in another dimension … it is able to affect ordinary lives by mysteriously interpenetrating into our three-dimensional world.' Wetiko does this through its incarnate representatives in the Cult and by weaving itself into The Field which on our level of reality is the electromagnetic information field of the simulation or Matrix. More than that, the simulation *is* Wetiko / Yaldabaoth. Caleb Scharf, Director of Astrobiology at Columbia University, has speculated that 'alien life' could be so advanced that it has transcribed itself into the quantum realm to become what we call physics. He said intelligence indistinguishable from the fabric of the Universe would solve many of its greatest mysteries:

> Perhaps hyper-advanced life isn't just external. Perhaps it's already all around. It is embedded in what we perceive to be physics itself, from the root behaviour of particles and fields to the phenomena of complexity and emergence ... In other words, life might not just be in the equations. It might BE the equations [My emphasis].

Scharf said it is possible that 'we don't recognise advanced life because it forms an integral and unsuspicious part of what we've considered to be the natural world'. I agree. Wetiko/Yaldabaoth *is* the simulation. We are literally in the body of the beast. But that doesn't mean it has to control us. We all have the power to overcome Wetiko

influence and the Cult knows that. I doubt it sleeps too well because it knows that.

Which Field?

This, I suggest, is how it all works. There are two Fields. One is the fierce electromagnetic light of the Matrix within the speed of light; the other is the 'watery light' of The Field beyond the walls of the Matrix that connects with the Great Infinity. Five-sense mind and the decoding systems of the body attach us to the Field of Matrix light. They have to or we could not experience this reality. Five-sense mind sees only the Matrix Field of information while our expanded consciousness is part of the Infinity Field. When we open our minds, and most importantly our hearts, to the Infinity Field we have a mission control which gives us an expanded perspective, a road map, to understand the nature of the five-sense world. If we are isolated only in five-sense mind there is no mission control. We're on our own trying to understand a world that's constantly feeding us information to ensure we do not understand. People in this state can feel 'lost' and bewildered with no direction or radar. You can see ever more clearly those who are influenced by the Fields of Big Infinity or little five-sense mind simply by their views and behaviour with regard to the 'Covid' hoax. We have had this division throughout known human history with the mass of the people on one side and individuals who could see and intuit beyond the walls of the simulation – Plato's prisoner who broke out of the cave and saw reality for what it is. Such people have always been targeted by Wetiko/Archon-possessed authority, burned at the stake or demonised as mad, bad and dangerous. The Cult today and its global network of 'anti-hate', 'anti-fascist' Woke groups are all expressions of Wetiko attacking those exposing the conspiracy, 'Covid' lies and the 'vaccine' agenda.

Woke as a whole is Wetiko which explains its black and white mentality and how at one it is with the Wetiko-possessed Cult. Paul Levy said: 'To be in this paradigm is to still be under the thrall of a two-valued logic – where things are either true or false – of a

wetikoized mind.' Wetiko consciousness is in a permanent rage, therefore so is Woke, and then there is Woke inversion and contradiction. 'Anti-fascists' act like fascists because fascists *and* 'anti-fascists' are both Wetiko at work. Political parties act the same while claiming to be different for the same reason. Secret society and satanic rituals are attaching initiates to Wetiko and the cold, ruthless, psychopathic mentality that secures the positions of power all over the world is Wetiko. Reframing 'training programmes' have the same cumulative effect of attaching Wetiko and we have their graduates described as automatons and robots with a cold, psychopathic, uncaring demeanour. They are all traits of Wetiko possession and look how many times they have been described in this book and elsewhere with regard to personnel behind 'Covid' including the police and medical profession. Climbing the greasy pole in any profession in a Wetiko society requires traits of Wetiko to get there and that is particularly true of politics which is not about fair competition and pre-eminence of ideas. It is founded on how many backs you can stab and arses you can lick. This culminated in the global 'Covid' coordination between the Wetiko possessed who pulled it off in all the different countries without a trace of empathy and compassion for their impact on humans. Our sight sense can see only holographic form and not the Field which connects holographic form. Therefore we perceive 'physical' objects with 'space' in between. In fact that 'space' is energy/consciousness operating on multiple frequencies. One of them is Wetiko and that connects the Cult psychopaths, those who submit to the psychopaths, and those who serve the psychopaths in the media operations of the world. Wetiko is Gates. Wetiko is the mask-wearing submissive. Wetiko is the fake journalist and 'fact-checker'. The Wetiko Field is coordinating the whole thing. Psychopaths, gofers, media operatives, 'anti-hate' hate groups, 'fact-checkers' and submissive people work as one unit *even without human coordination* because they are attached to the *same* Field which is organising it all (Fig 22). Paul Levy is here describing how Wetiko-possessed people are drawn together and refuse to let any information breach their rigid

perceptions. He was writing long before 'Covid', but I think you will recognise followers of the 'Covid' religion *oh just a little bit*:

People who are channelling the vibratory frequency of wetiko align with each other through psychic resonance to reinforce their unspoken shared agreement so as to uphold their deranged view of reality. Once an unconscious content takes possession of certain individuals, it irresistibly draws them together by mutual attraction and knits them into groups tied together by their shared madness that can easily swell into an avalanche of insanity.

A psychic epidemic is a closed system, which is to say that it is insular and not open to any new information or informing influences from the outside world which contradict its fixed, limited, and limiting perspective.

There we have the Woke mind and the 'Covid' mind. Compatible resonance draws the awakening together, too, which is clearly happening today.

Figure 22: The Wetiko Field from which the Cult pyramid and its personnel are made manifest. (Image by Neil Hague).

Spiritual servitude

Wetiko doesn't care about humans. It's not human; it just possesses humans for its own ends and the effect (depending on the scale of

possession) can be anything from extreme psychopathy to unquestioning obedience. Wetiko's worst nightmare is for human consciousness to expand beyond the simulation. Everything is focussed on stopping that happening through control of information, thus perception, thus frequency. The 'education system', media, science, medicine, academia, are all geared to maintaining humanity in five-sense servitude as is the constant stimulation of low-vibrational mental and emotional states (see 'Covid'). Wetiko seeks to dominate those subconscious spaces between five-sense perception and expanded consciousness where the computer meets the operator. From these subconscious hiding places Wetiko speaks to us to trigger urges and desires that we take to be our own and manipulate us into anything from low-vibrational to psychopathic states. Remember how Islam describes the Jinn as invisible tricksters that 'whisper' and confuse. Wetiko is the origin of the 'trickster god' theme that you find in cultures all over the world. Jinn, like the Archons, are Wetiko which is terrified of humans awakening and reconnecting with our true self for then its energy source has gone. With that the feedback loop breaks between Wetiko and human perception that provides the energetic momentum on which its very existence depends as a force of evil. Humans are both its target and its source of survival, but only if we are operating in low-vibrational states of fear, hate, depression and the background anxiety that most people suffer. We are Wetiko's target because we are its key to survival. It needs us, not the other way round. Paul Levy writes:

A vampire has no intrinsic, independent, substantial existence in its own right; it only exists in relation to us. The pathogenic, vampiric mind-parasite called wetiko is nothing in itself – not being able to exist from its own side – yet it has a 'virtual reality' such that it can potentially destroy our species …

…The fact that a vampire is not reflected by a mirror can also mean that what we need to see is that there's nothing, no-thing to see, other than ourselves. The fact that wetiko is the expression of something inside of us means that the cure for wetiko is with us as well. The critical issue is finding this cure within us and then putting it into effect.

Evil begets evil because if evil does not constantly expand and find new sources of energetic sustenance its evil, its *distortion*, dies with the assimilation into balance and harmony. Love is the garlic to Wetiko's vampire. Evil, the absence of love, cannot exist in the presence of love. I think I see a way out of here. I have emphasised so many times over the decades that the Archons/Wetiko and their Cult are not all powerful. *They are not*. I don't care how it looks even now *they are not*. I have not called them little boys in short trousers for effect. I have said it because it is true. Wetiko's insatiable desire for power over others is not a sign of its omnipotence, but its insecurity. Paul Levy writes: 'Due to the primal fear which ultimately drives it and which it is driven to cultivate, wetiko's body politic has an intrinsic and insistent need for centralising power and control so as to create imagined safety for itself.' *Yeeeeeees!* Exactly! Why does Wetiko want humans in an ongoing state of fear? Wetiko itself *is* fear and it is petrified of love. As evil is an absence of love, so love is an absence of fear. Love conquers all and *especially* Wetiko which *is* fear. Wetiko brought fear into the world when it wasn't here before. *Fear* was the 'fall', the fall into low-frequency ignorance and illusion – fear is **F**alse **E**motion **A**ppearing **R**eal. The simulation is driven and energised by fear because Wetiko/Yaldabaoth (fear) *are* the simulation. Fear is the absence of love and Wetiko is the absence of love.

Wetiko today

We can now view current events from this level of perspective. The 'Covid' hoax has generated momentous amounts of ongoing fear, anxiety, depression and despair which have empowered Wetiko. No wonder people like Gates have been the instigators when they are Wetiko incarnate and exhibit every trait of Wetiko in the extreme. See how cold and unemotional these people are like Gates and his cronies, how dead of eye they are. That's Wetiko. Sabbatians are Wetiko and everything they control including the World Health Organization, Big Pharma and the 'vaccine' makers, national 'health'

hierarchies, corporate media, Silicon Valley, the banking system, and the United Nations with its planned transformation into world government. All are controlled and possessed by the Wetiko distortion into distorting human society in its image. We are with this knowledge at the gateway to understanding the world. Divisions of race, culture, creed and sexuality are diversions to hide the real division between those possessed and influenced by Wetiko and those that are not. The 'Covid' hoax has brought both clearly into view. Human behaviour is not about race. Tyrants and dictatorships come in all colours and creeds. What unites the US president bombing the innocent and an African tribe committing genocide against another as in Rwanda? What unites them? *Wetiko*. All wars are Wetiko, all genocide is Wetiko, all hunger over centuries in a world of plenty is Wetiko. Children going to bed hungry, including in the West, is Wetiko. Cult-generated Woke racial divisions that focus on the body are designed to obscure the reality that divisions in behaviour are manifestations of mind, not body. Obsession with body identity and group judgement is a means to divert attention from the real source of behaviour – mind and perception. Conflict sown by the Woke both within themselves and with their target groups are Wetiko providing lunch for itself through still more agents of the division, chaos, and fear on which it feeds. The Cult is seeking to assimilate the entirety of humanity and all children and young people into the Wetiko frequency by manipulating them into states of fear and despair. Witness all the suicide and psychological unravelling since the spring of 2020. Wetiko psychopaths want to impose a state of unquestioning obedience to authority which is no more than a conduit for Wetiko to enforce its will and assimilate humanity into itself. It needs us to believe that resistance is futile when it fears resistance and even more so the game-changing non-cooperation with its impositions. It can use violent resistance for its benefit. Violent impositions and violent resistance are *both* Wetiko. The Power of Love with its Power of No will sweep Wetiko from our world. Wetiko and its Cult know that. They just don't want us to know.

AI Wetiko

This brings me to AI or artificial intelligence and something else Wetikos don't want us to know. What is AI *really*? I know about computer code algorithms and AI that learns from data input. These, however, are more diversions, the expeditionary force, for the real AI that they want to connect to the human brain as promoted by Silicon Valley Wetikos like Kurzweil. What is this AI? It is the frequency of *Wetiko*, the frequency of the Archons. The connection of AI to the human brain is the connection of the Wetiko frequency to create a Wetiko hive mind and complete the job of assimilation. The hive mind is planned to be controlled from Israel and China which are both 100 percent owned by Wetiko Sabbatians. The assimilation process has been going on minute by minute in the 'smart' era which fused with the 'Covid' era. We are told that social media is scrambling the minds of the young and changing their personality. This is true, but what is social media? Look more deeply at how it works, how it creates divisions and conflict, the hostility and cruelty, the targeting of people until they are destroyed. That's Wetiko. Social media is manipulated to tune people to the Wetiko frequency with all the emotional exploitation tricks employed by platforms like Facebook and its Wetiko front man, Zuckerberg. Facebook's Instagram announced a new platform for children to overcome a legal bar on them using the main site. This is more Wetiko exploitation and manipulation of kids. Amnesty International likened the plan to foxes offering to guard the henhouse and said it was incompatible with human rights. Since when did Wetiko or Zuckerberg (I repeat myself) care about that? Would Brin and Page at Google, Wojcicki at YouTube, Bezos at Amazon and whoever the hell runs Twitter act as they do if they were not channelling Wetiko? Would those who are developing technologies for no other reason than human control? How about those designing and selling technologies to kill people and Big Pharma drug and 'vaccine' producers who know they will end or devastate lives? Quite a thought for these people to consider is that if you are Wetiko in a human life you are Wetiko on the 'other side' unless your frequency

changes and that can only change by a change of perception which becomes a change of behaviour. Where Gates is going does not bear thinking about although perhaps that's exactly where he wants to go. Either way, that's where he's going. His frequency will make it so.

The frequency lair

I have been saying for a long time that a big part of the addiction to smartphones and devices is that a frequency is coming off them that entraps the mind. People spend ages on their phones and sometimes even a minute or so after they put them down they pick them up again and it all repeats. 'Covid' lockdowns will have increased this addiction a million times for obvious reasons. Addictions to alcohol overindulgence and drugs are another way that Wetiko entraps consciousness to attach to its own. Both are symptoms of low-vibrational psychological distress which alcoholism and drug addiction further compound. Do we think it's really a coincidence that access to them is made so easy while potions that can take people into realms beyond the simulation are banned and illegal? I have explored smartphone addiction in other books, the scale is mind-blowing, and that level of addiction does not come without help. Tech companies that make these phones are Wetiko and they will have no qualms about destroying the minds of children. We are seeing again with these companies the Wetiko perceptual combination of psychopathic enforcers and weak and meek unquestioning compliance by the rank and file.

The global Smart Grid is the Wetiko Grid and it is crucial to complete the Cult endgame. The simulation is radiation and we are being deluged with technological radiation on a devastating scale. Wetiko frauds like Elon Musk serve Cult interests while occasionally criticising them to maintain his street-cred. 5G and other forms of Wi-Fi are being directed at the earth from space on a volume and scale that goes on increasing by the day. Elon Musk's (officially) SpaceX Starlink project is in the process of putting tens of thousands of satellites in low orbit to cover every inch of the planet with 5G and other Wi-Fi to create Kurzweil's global 'cloud' to which the

human mind is planned to be attached very soon. SpaceX has approval to operate 12,000 satellites with more than 1,300 launched at the time of writing and applications filed for *30,000* more. Other operators in the Wi-Fi, 5G, low-orbit satellite market include OneWeb (UK), Telesat (Canada), and AST & Science (US). Musk tells us that AI could be the end of humanity and then launches a company called Neuralink to connect the human brain to computers. Musk's (in theory) Tesla company is building electric cars and the driverless vehicles of the smart control grid. As frauds and bullshitters go Elon Musk in my opinion is Major League.

5G and technological radiation in general are destructive to human health, genetics and psychology and increasing the strength of artificial radiation underpins the five-sense perceptual bubbles which are themselves expressions of radiation or electromagnetism. Freedom activist John Whitehead was so right with his 'databit by databit, we are building our own electronic concentration camps'. The Smart Grid and 5G is a means to control the human mind and infuse perceptual information into The Field to influence anyone in sync with its frequency. You can change perception and behaviour en masse if you can manipulate the population into those levels of frequency and this is happening all around us today. The arrogance of Musk and his fellow Cult operatives knows no bounds in the way that we see with Gates. Musk's satellites are so many in number already they are changing the night sky when viewed from Earth. The astronomy community has complained about this and they have seen nothing yet. Some consequences of Musk's Wetiko hubris include: Radiation; visible pollution of the night sky; interference with astronomy and meteorology; ground and water pollution from intensive use of increasingly many spaceports; accumulating space debris; continual deorbiting and burning up of aging satellites, polluting the atmosphere with toxic dust and smoke; and ever-increasing likelihood of collisions. A collective public open letter of complaint to Musk said:

> We are writing to you … because SpaceX is in process of surrounding the Earth with a network of thousands of satellites whose very purpose is to irradiate every square inch of the

Earth. SpaceX, like everyone else, is treating the radiation as if it were not there. As if the mitochondria in our cells do not depend on electrons moving undisturbed from the food we digest to the oxygen we breathe.

As if our nervous systems and our hearts are not subject to radio frequency interference like any piece of electronic equipment. As if the cancer, diabetes, and heart disease that now afflict a majority of the Earth's population are not metabolic diseases that result from interference with our cellular machinery. As if insects everywhere, and the birds and animals that eat them, are not starving to death as a result.

People like Musk and Gates believe in their limitless Wetiko arrogance that they can do whatever they like to the world because they own it. Consequences for humanity are irrelevant. It's absolutely time that we stopped taking this shit from these self-styled masters of the Earth when you consider where this is going.

Why is the Cult so anti-human?

I hear this question often: Why would they do this when it will affect them, too? Ah, but will it? Who is this *them*? Forget their bodies. They are just vehicles for Wetiko consciousness. When you break it all down to the foundations we are looking at a state of severely distorted consciousness targeting another state of consciousness for assimilation. The rest is detail. The simulation is the fly-trap in which unique sensations of the five senses create a cycle of addiction called reincarnation. Renegade Minds see that everything which happens in our reality is a smaller version of the whole picture in line with the holographic principle. Addiction to the radiation of smart technology is a smaller version of addiction to the whole simulation. Connecting the body/brain to AI is taking that addiction on a giant step further to total ongoing control by assimilating human incarnate consciousness into Wetiko. I have watched during the 'Covid' hoax how many are becoming ever more profoundly attached to Wetiko's perceptual calling cards of aggressive response to any other point of view ('There is no other god but me'), psychopathic lack of compassion and empathy, and servile submission to the narrative and will of authority. Wetiko is the psychopaths *and* subservience to psychopaths. The Cult of Wetiko is

so anti-human because it is *not* human. It embarked on a mission to destroy human by targeting everything that it means to be human and to survive as human. 'Covid' is not the end, just a means to an end. The Cult with its Wetiko consciousness is seeking to change Earth systems, including the atmosphere, to suit them, not humans. The gathering bombardment of 5G alone from ground and space is dramatically changing The Field with which the five senses interact. There is so much more to come if we sit on our hands and hope it will all go away. It is not meant to go away. It is meant to get ever more extreme and we need to face that while we still can – just.

Carbon dioxide is the gas of life. Without that human is over. Kaput, gone, history. No natural world, no human. The Cult has created a cock and bull story about carbon dioxide and climate change to justify its reduction to the point where Gates and the ignoramus Biden 'climate chief' John Kerry want to suck it out of the atmosphere. Kerry wants to do this because his master Gates does. Wetikos have made the gas of life a demon with the usual support from the Wokers of Extinction Rebellion and similar organisations and the bewildered puppet-child that is Greta Thunberg who was put on the world stage by Klaus Schwab and the World Economic Forum. The name Extinction Rebellion is both ironic and as always Wetiko inversion. The gas that we need to survive must be reduced to save us from extinction. The most basic need of human is oxygen and we now have billions walking around in face nappies depriving body and brain of this essential requirement of human existence. More than that 5G at 60 gigahertz interacts with the oxygen molecule to reduce the amount of oxygen the body can absorb into the bloodstream. The obvious knock-on consequences of that for respiratory and cognitive problems and life itself need no further explanation. Psychopaths like Musk are assembling a global system of satellites to deluge the human atmosphere with this insanity. The man should be in jail. Here we have two most basic of human needs, oxygen and carbon dioxide, being dismantled.

Two others, water and food, are getting similar treatment with the United Nations Agendas 21 and 2030 – the Great Reset – planning to

centrally control all water and food supplies. People will not even own rain water that falls on their land. Food is affected at the most basic level by reducing carbon dioxide. We have genetic modification or GMO infiltrating the food chain on a mass scale, pesticides and herbicides polluting the air and destroying the soil. Freshwater fish that provide livelihoods for 60 million people and feed hundreds of millions worldwide are being 'pushed to the brink' according the conservationists while climate change is the only focus. Now we have Gates and Schwab wanting to dispense with current food sources all together and replace them with a synthetic version which the Wetiko Cult would control in terms of production and who eats and who doesn't. We have been on the Totalitarian Tiptoe to this for more than 60 years as food has become ever more processed and full of chemical shite to the point today when it's not natural food at all. As Dr Tom Cowan says: 'If it has a label don't eat it.' Bill Gates is now the biggest owner of farmland in the United States and he does nothing without an ulterior motive involving the Cult. Klaus Schwab wrote: 'To feed the world in the next 50 years we will need to produce as much food as was produced in the last 10,000 years … food security will only be achieved, however, if regulations on genetically modified foods are adapted to reflect the reality that gene editing offers a precise, efficient and safe method of improving crops.' Liar. People and the world are being targeted with aluminium through vaccines, chemtrails, food, drink cans, and endless other sources when aluminium has been linked to many health issues including dementia which is increasing year after year. Insects, bees and wildlife essential to the food chain are being deleted by pesticides, herbicides and radiation which 5G is dramatically increasing with 6G and 7G to come. The pollinating bee population is being devastated while wildlife including birds, dolphins and whales are having their natural radar blocked by the effects of ever-increasing radiation. In the summer windscreens used to be splattered with insects so numerous were they. It doesn't happen now. Where have they gone?

Synthetic everything

The Cult is introducing genetically-modified versions of trees, plants and insects including a Gates-funded project to unleash hundreds of millions of genetically-modified, lab-altered and patented male mosquitoes to mate with wild mosquitoes and induce genetic flaws that cause them to die out. Clinically-insane Gates-funded Japanese researchers have developed mosquitos that spread vaccine and are dubbed 'flying vaccinators'. Gates is funding the modification of weather patterns in part to sell the myth that this is caused by carbon dioxide and he's funding geoengineering of the skies to change the atmosphere. Some of this came to light with the Gates-backed plan to release tonnes of chalk into the atmosphere to 'deflect the Sun and cool the planet'. Funny how they do this while the heating effect of the Sun is not factored into climate projections focussed on carbon dioxide. The reason is that they want to reduce carbon dioxide (so don't mention the Sun), but at the same time they do want to reduce the impact of the Sun which is so essential to human life and health. I have mentioned the sun-cholesterol-vitamin D connection as they demonise the Sun with warnings about skin cancer (caused by the chemicals in sun cream they tell you to splash on). They come from the other end of the process with statin drugs to reduce cholesterol that turns sunlight into vitamin D. A lack of vitamin D leads to a long list of health effects and how vitamin D levels must have fallen with people confined to their homes over 'Covid'. Gates is funding other forms of geoengineering and most importantly chemtrails which are dropping heavy metals, aluminium and self-replicating nanotechnology onto the Earth which is killing the natural world. See *Everything You Need To Know, But Have Never Been Told* for the detailed background to this.

Every human system is being targeted for deletion by a force that's not human. The Wetiko Cult has embarked on the process of transforming the human body from biological to synthetic biological as I have explained. Biological is being replaced by the artificial and synthetic – Archontic 'countermimicry' – right across human society. The plan eventually is to dispense with the human body altogether

and absorb human consciousness – which it wouldn't really be by then – into cyberspace (the simulation which is Wetiko/Yaldabaoth). Preparations for that are already happening if people would care to look. The alternative media rightly warns about globalism and 'the globalists', but this is far bigger than that and represents the end of the human race as we know it. The 'bad copy' of prime reality that Gnostics describe was a bad copy of harmony, wonder and beauty to start with before Wetiko/Yaldabaoth set out to change the simulated 'copy' into something very different. The process was slow to start with. Entrapped humans in the simulation timeline were not technologically aware and they had to be brought up to intellectual speed while being suppressed spiritually to the point where they could build their own prison while having no idea they were doing so. We have now reached that stage where technological intellect has the potential to destroy us and that's why events are moving so fast. Central American shaman Don Juan Matus said:

> Think for a moment, and tell me how you would explain the contradictions between the intelligence of man the engineer and the stupidity of his systems of belief, or the stupidity of his contradictory behaviour. Sorcerers believe that the predators have given us our systems of beliefs, our ideas of good and evil; our social mores. They are the ones who set up our dreams of success or failure. They have given us covetousness, greed, and cowardice. It is the predator who makes us complacent, routinary, and egomaniacal.
>
> In order to keep us obedient and meek and weak, the predators engaged themselves in a stupendous manoeuvre – stupendous, of course, from the point of view of a fighting strategist; a horrendous manoeuvre from the point of those who suffer it. They gave us their mind. The predators' mind is baroque, contradictory, morose, filled with the fear of being discovered any minute now.

For 'predators' see Wetiko, Archons, Yaldabaoth, Jinn, and all the other versions of the same phenomenon in cultures and religions all over the world. The theme is always the same because it's true and it's real. We have reached the point where we have to deal with it. The question is – how?

Don't fight – walk away

I thought I'd use a controversial subheading to get things moving in terms of our response to global fascism. What do you mean 'don't fight'? What do you mean 'walk away'? We've got to fight. We can't walk away. Well, it depends what we mean by fight and walk away. If fighting means physical combat we are playing Wetiko's game and falling for its trap. It wants us to get angry, aggressive, and direct hate and hostility at the enemy we think we must fight. Every war, every battle, every conflict, has been fought with Wetiko leading both sides. It's what it does. Wetiko wants a fight, anywhere, any place. Just hit me, son, so I can hit you back. Wetiko hits Wetiko and Wetiko hits Wetiko in return. I am very forthright as you can see in exposing Wetikos of the Cult, but I don't hate them. I refuse to hate them. It's what they want. What you hate you become. What you *fight* you become. Wokers, 'anti-haters' and 'anti-fascists' prove this every time they reach for their keyboards or don their balaclavas. By walk away I mean to disengage from Wetiko which includes ceasing to cooperate with its tyranny. Paul Levy says of Wetiko:

> The way to 'defeat' evil is not to try to destroy it (for then, in playing evil's game, we have already lost), but rather, to find the invulnerable place within ourselves where evil is unable to vanquish us – this is to truly 'win' our battle with evil.

Wetiko is everywhere in human society and it's been on steroids since the 'Covid' hoax. Every shouting match over wearing masks has Wetiko wearing a mask and Wetiko not wearing one. It's an electrical circuit of push and resist, push and resist, with Wetiko pushing *and* resisting. Each polarity is Wetiko empowering itself. Dictionary definitions of 'resist' include 'opposing, refusing to accept or comply with' and the word to focus on is 'opposing'. What form does this take – setting police cars alight or 'refusing to accept or comply with'? The former is Wetiko opposing Wetiko while the other points the way forward. This is the difference between those aggressively demanding that government fascism must be obeyed who stand in stark contrast to the great majority of Pushbackers. We saw this clearly with a march by thousands of Pushbackers against lockdown in London followed days later by a Woker-hijacked

protest in Bristol in which police cars were set on fire. Masks were virtually absent in London and widespread in Bristol. Wetiko wants lockdown on every level of society and infuses its aggression to police it through its unknowing stooges. Lockdown protesters are the ones with the smiling faces and the hugs, The two blatantly obvious states of being – getting more obvious by the day – are the result of Wokers and their like becoming ever more influenced by the simulation Field of Wetiko and Pushbackers ever more influenced by The Field of a far higher vibration beyond the simulation. Wetiko can't invade the heart which is where most lockdown opponents are coming from. It's the heart that allows them to see through the lies to the truth in ways I will be highlighting.

Renegade Minds know that calmness is the place from which wisdom comes. You won't find wisdom in a hissing fit and wisdom is what we need in abundance right now. Calmness is not weakness – you don't have to scream at the top of your voice to be strong. Calmness is indeed a sign of strength. 'No' means I'm not doing it. *NOOOO!!!* doesn't mean you're not doing it even more. Volume does not advance 'No – I'm not doing it'. You are just not doing it. Wetiko possessed and influenced don't know how to deal with that. Wetiko wants a fight and we should not give it one. What it needs more than anything is our *cooperation* and we should not give that either. Mass rallies and marches are great in that they are a visual representation of feeling, but if it ends there they are irrelevant. You demand that Wetikos act differently? Well, they're not going to are they? They are Wetikos. We don't need to waste our time demanding that something doesn't happen when that will make no difference. We need to delete the means that *allows* it to happen. This, invariably, is our cooperation. You can demand a child stop firing a peashooter at the dog or you can refuse to buy the peashooter. If you provide the means you are cooperating with the dog being smacked on the nose with a pea. How can the authorities enforce mask-wearing if millions in a country refuse? What if the 74 million Pushbackers that voted for Trump in 2020 refused to wear masks, close their businesses or stay in their homes. It would be unenforceable. The

few control the many through the compliance of the many and that's always been the dynamic be it 'Covid' regulations or the Roman Empire. I know people can find it intimidating to say no to authority or stand out in a crowd for being the only one with a face on display; but it has to be done or it's over. I hope I've made clear in this book that where this is going will be far more intimidating than standing up now and saying 'No' – I will not cooperate with my own enslavement and that of my children. There might be consequences for some initially, although not so if enough do the same. The question that must be addressed is what is going to happen if we don't? It is time to be strong and unyieldingly so. No means no. Not here and there, but *everywhere* and *always*. I have refused to wear a mask and obey all the other nonsense. I will not comply with tyranny. I repeat: Fascism is not imposed by fascists – there are never enough of them. Fascism is imposed by the population acquiescing to fascism. *I will not do it*. I will die first, or my body will. Living meekly under fascism is a form of death anyway, the death of the spirit that Martin Luther King described.

Making things happen

We must not despair. This is not over till it's over and it's far from that. The 'fat lady' must refuse to sing. The longer the 'Covid' hoax has dragged on and impacted on more lives we have seen an awakening of phenomenal numbers of people worldwide to the realisation that what they have believed all their lives is not how the world really is. Research published by the system-serving University of Bristol and King's College London in February, 2021, concluded: 'One in every 11 people in Britain say they trust David Icke's take on the coronavirus pandemic.' It will be more by now and we have gathering numbers to build on. We must urgently progress from seeing the scam to ceasing to cooperate with it. Prominent German lawyer Reiner Fuellmich, also licenced to practice law in America, is doing a magnificent job taking the legal route to bring the psychopaths to justice through a second Nuremberg tribunal for crimes against humanity. Fuellmich has an impressive record of

beating the elite in court and he formed the German Corona Investigative Committee to pursue civil charges against the main perpetrators with a view to triggering criminal charges. Most importantly he has grasped the foundation of the hoax – the PCR test not testing for the 'virus' – and Christian Drosten is therefore on his charge sheet along with Gates frontman Tedros at the World Health Organization. Major players must be not be allowed to inflict their horrors on the human race without being brought to book. A life sentence must follow for Bill Gates and the rest of them. A group of researchers has also indicted the government of Norway for crimes against humanity with copies sent to the police and the International Criminal Court. The lawsuit cites participation in an internationally-planned false pandemic and violation of international law and human rights, the European Commission's definition of human rights by coercive rules, Nuremberg and Hague rules on fundamental human rights, and the Norwegian constitution. We must take the initiative from hereon and not just complain, protest and react.

There are practical ways to support vital mass non-cooperation. Organising in numbers is one. Lockdown marches in London in the spring in 2021 were mass non-cooperation that the authorities could not stop. There were too many people. Hundreds of thousands walked the London streets in the centre of the road for mile after mile while the Face-Nappies could only look on. They were determined, but calm, and just *did it* with no histrionics and lots of smiles. The police were impotent. Others are organising group shopping without masks for mutual support and imagine if that was happening all over. Policing it would be impossible. If the store refuses to serve people in these circumstances they would be faced with a long line of trolleys full of goods standing on their own and everything would have to be returned to the shelves. How would they cope with that if it kept happening? I am talking here about moving on from complaining to being pro-active; from watching things happen to making things happen. I include in this our relationship with the police. The behaviour of many Face-Nappies

has been disgraceful and anyone who thinks they would never find concentration camp guards in the 'enlightened' modern era have had that myth busted big-time. The period and setting may change – Wetikos never do. I watched film footage from a London march in which a police thug viciously kicked a protestor on the floor who had done nothing. His fellow Face-Nappies stood in a ring protecting him. What he did was a criminal assault and with a crowd far outnumbering the police this can no longer be allowed to happen unchallenged. I get it when people chant 'shame on you' in these circumstances, but that is no longer enough. They *have* no shame those who do this. Crowds needs to start making a citizen's arrest of the police who commit criminal offences and brutally attack innocent people and defenceless women. A citizen's arrest can be made under section 24A of the UK Police and Criminal Evidence (PACE) Act of 1984 and you will find something similar in other countries. I prefer to call it a Common Law arrest rather than citizen's for reasons I will come to shortly. Anyone can arrest a person committing an indictable offence or if they have reasonable grounds to suspect they are committing an indictable offence. On both counts the attack by the police thug would have fallen into this category. A citizen's arrest can be made to stop someone:

- Causing physical injury to himself or any other person
- Suffering physical injury
- Causing loss of or damage to property
- Making off before a constable can assume responsibility for him

A citizen's arrest may also be made to prevent a breach of the peace under Common Law and if they believe a breach of the peace will happen or anything related to harm likely to be done or already done in their presence. This is the way to go I think – the Common Law version. If police know that the crowd and members of the public will no longer be standing and watching while they commit

their thuggery and crimes they will think twice about acting like Brownshirts and Blackshirts.

Common Law – common sense

Mention of Common Law is very important. Most people think the law is the law as in one law. This is not the case. There are two bodies of law, Common Law and Statute Law, and they are not the same. Common Law is founded on the simple premise of do no harm. It does not recognise victimless crimes in which no harm is done while Statute Law does. There is a Statute Law against almost everything. So what is Statute Law? Amazingly it's the law of the *sea* that was brought ashore by the Cult to override the law of the land which is Common Law. They had no right to do this and as always they did it anyway. They had to. They could not impose their will on the people through Common Law which only applies to do no harm. How could you stitch up the fine detail of people's lives with that? Instead they took the law of the sea, or Admiralty Law, and applied it to the population. Statute Law refers to all the laws spewing out of governments and their agencies including all the fascist laws and regulations relating to 'Covid'. The key point to make is that Statute Law is *contract law*. It only applies between *contracting* corporations. Most police officers don't even know this. They have to be kept in the dark, too. Long ago when merchants and their sailing ships began to trade with different countries a contractual law was developed called Admiralty Law and other names. Again it only applied to *contracts* agreed between *corporate* entities. If there is no agreed contract the law of the sea had no jurisdiction *and that still applies to its new alias of Statute Law*. The problem for the Cult when the law of the sea was brought ashore was an obvious one. People were not corporations and neither were government entities. To overcome the latter they made governments and all associated organisations corporations. All the institutions are *private corporations* and I mean governments and their agencies, local councils, police, courts, military, US states, the whole lot. Go to the

Dun and Bradstreet corporate listings website for confirmation that they are all corporations. You are arrested by a private corporation called the police by someone who is really a private security guard and they take you to court which is another private corporation. Neither have jurisdiction over you unless you consent and *contract* with them. This is why you hear the mantra about law enforcement policing by *consent* of the people. In truth the people 'consent' only in theory through monumental trickery.

Okay, the Cult overcame the corporate law problem by making governments and institutions corporate entities; but what about people? They are not corporations are they? Ah ... well in a sense, and *only* a sense, they are. Not people exactly – the illusion of people. The Cult creates a corporation in the name of everyone at the time that their birth certificate is issued. Note birth/ *berth* certificate and when you go to court under the law of the sea on land you stand in a *dock*. These are throwbacks to the origin. My Common Law name is David Vaughan Icke. The name of the corporation created by the government when I was born is called Mr David Vaughan Icke usually written in capitals as MR DAVID VAUGHAN ICKE. That is not me, the living, breathing man. It is a fictitious corporate entity. The trick is to make you think that David Vaughan Icke and MR DAVID VAUGHAN ICKE are the same thing. *They are not*. When police charge you and take you to court they are prosecuting the corporate entity and not the living, breathing, man or woman. They have to trick you into identifying as the corporate entity and contracting with them. Otherwise they have no jurisdiction. They do this through a language known as legalese. Lawful and legal are not the same either. Lawful relates to Common Law and legal relates to Statute Law. Legalese is the language of Statue Law which uses terms that mean one thing to the public and another in legalese. Notice that when a police officer tells someone why they are being charged he or she will say at the end: 'Do you understand?' To the public that means 'Do you comprehend?' In legalese it means 'Do you stand under me?' Do you stand under my authority? If you say

yes to the question you are unknowingly agreeing to give them jurisdiction over you in a contract between two corporate entities.

This is a confidence trick in every way. Contracts have to be agreed between informed parties and if you don't know that David Vaughan Icke is agreeing to be the corporation MR DAVID VAUGHAN ICKE you cannot knowingly agree to contract. They are deceiving you and another way they do this is to ask for proof of identity. You usually show them a driving licence or other document on which your corporate name is written. In doing so you are accepting that you are that corporate entity when you are not. Referring to yourself as a 'person' or 'citizen' is also identifying with your corporate fiction which is why I made the Common Law point about the citizen's arrest. If you are approached by a police officer you identify yourself immediately as a living, breathing, man or woman and say 'I do not consent, I do not contract with you and I do not understand' or stand under their authority. I have a Common Law birth certificate as a living man and these are available at no charge from commonlawcourt.com. Businesses registered under the Statute Law system means that its laws apply. There are, however, ways to run a business under Common Law. Remember all 'Covid' laws and regulations are Statute Law – the law of *contracts* and you do not have to contract. This doesn't mean that you can kill someone and get away with it. Common Law says do no harm and that applies to physical harm, financial harm etc. Police are employees of private corporations and there needs to be a new system of non-corporate Common Law constables operating outside the Statute Law system. If you go to davidicke.com and put Common Law into the search engine you will find videos that explain Common Law in much greater detail. It is definitely a road we should walk.

With all my heart

I have heard people say that we are in a spiritual war. I don't like the term 'war' with its Wetiko dynamic, but I know what they mean. Sweep aside all the bodily forms and we are in a situation in which two states of consciousness are seeking very different realities.

Wetiko wants upheaval, chaos, fear, suffering, conflict and control. The other wants love, peace, harmony, fairness and freedom. That's where we are. We should not fall for the idea that Wetiko is all-powerful and there's nothing we can do. Wetiko is not all-powerful. It's a joke, pathetic. It doesn't have to be, but it has made that choice for now. A handful of times over the years when I have felt the presence of its frequency I have allowed it to attach briefly so I could consciously observe its nature. The experience is not pleasant, the energy is heavy and dark, but the ease with which you can kick it back out the door shows that its real power is in persuading us that it has power. It's all a con. Wetiko is a con. It's a trickster and not a power that can control us if we unleash our own. The con is founded on manipulating humanity to give its power to Wetiko which recycles it back to present the illusion that it has power when its power is *ours* that we gave away. This happens on an energetic level and plays out in the world of the seen as humanity giving its power to Wetiko authority which uses that power to control the population when the power is only the power the population has handed over. How could it be any other way for billions to be controlled by a relative few? I have had experiences with people possessed by Wetiko and again you can kick its arse if you do it with an open heart. Oh yes – the *heart* which can transform the world of perceived 'matter'.

We are receiver-transmitters and processors of information, but what information and where from? Information is processed into perception in three main areas – the brain, the heart and the belly. These relate to thinking, knowing, and emotion. Wetiko wants us to be head and belly people which means we think within the confines of the Matrix simulation and low-vibrational emotional reaction scrambles balance and perception. A few minutes on social media and you see how emotion is the dominant force. Woke is all emotion and is therefore thought-free and fact-free. Our heart is something different. It *knows* while the head *thinks* and has to try to work it out because it doesn't know. The human energy field has seven prime vortexes which connect us with wider reality (Fig 23). Chakra means

'wheels of light' in the Sanskrit language of ancient India. The main ones are: The crown chakra on top of the head; brow (or 'third eye') chakra in the centre of the forehead; throat chakra; heart chakra in the centre of the chest; solar plexus chakra below the sternum; sacral chakra beneath the navel; and base chakra at the bottom of the spine. Each one has a particular function or functions. We feel anxiety and nervousness in the belly where the sacral chakra is located and this processes emotion that can affect the colon to give people 'the shits' or make them 'shit scared' when they are nervous. Chakras all play an important role, but the Mr and Mrs Big is the heart chakra which sits at the centre of the seven, above the chakras that connect us to the 'physical' and below those that connect with higher realms (or at least should). Here in the heart chakra we feel love, empathy and compassion – 'My heart goes out to you'. Those with closed hearts become literally 'heart-less' in their attitudes and behaviour (see Bill Gates). Native Americans portrayed Wetiko with what Paul Levy calls a 'frigid, icy heart, devoid of mercy' (see Bill Gates).

Figure 23: The chakra system which interpenetrates the human energy field. The heart chakra is the governor – or should be.

Wetiko trembles at the thought of heart energy which it cannot infiltrate. The frequency is too high. What it seeks to do instead is close the heart chakra vortex to block its perceptual and energetic influence. Psychopaths have 'hearts of stone' and emotionally-damaged people have 'heartache' and 'broken hearts'. The astonishing amount of heart disease is related to heart chakra

disruption with its fundamental connection to the 'physical' heart. Dr Tom Cowan has written an outstanding book challenging the belief that the heart is a pump and making the connection between the 'physical' and spiritual heart. Rudolph Steiner who was way ahead of his time said the same about the fallacy that the heart is a pump. *What*? The heart is not a pump? That's crazy, right? Everybody knows that. Read Cowan's *Human Heart, Cosmic Heart* and you will realise that the very idea of the heart as a pump is ridiculous when you see the evidence. How does blood in the feet so far from the heart get pumped horizontally up the body by the heart?? Cowan explains in the book the real reason why blood moves as it does. Our 'physical' heart is used to symbolise love when the source is really the heart vortex or spiritual heart which is our most powerful energetic connection to 'out there' expanded consciousness. That's why we feel *knowing* – intuitive knowing – in the centre of the chest. Knowing doesn't come from a process of thoughts leading to a conclusion. It is there in an instant all in one go. Our heart knows because of its connection to levels of awareness that *do* know. This is the meaning and source of intuition – intuitive *knowing*.

For the last more than 30 years of uncovering the global game and the nature of reality my heart has been my constant antenna for truth and accuracy. An American intelligence insider once said that I had quoted a disinformer in one of my books and yet I had only quoted the part that was true. He asked: 'How do you do that?' By using my heart antenna was the answer and anyone can do it. Heart-centred is how we are meant to be. With a closed heart chakra we withdraw into a closed mind and the bubble of five-sense reality. If you take a moment to focus your attention on the centre of your chest, picture a spinning wheel of light and see it opening and expanding. You will feel it happening, too, and perceptions of the heart like joy and love as the heart impacts on the mind as they interact. The more the chakra opens the more you will feel expressions of heart consciousness and as the process continues, and becomes part of you, insights and knowings will follow. An open

heart is connected to that level of awareness that knows all is *One*. You will see from its perspective that the fault-lines that divide us are only illusions to control us. An open heart does not process the illusions of race, creed and sexuality except as brief experiences for a consciousness that is all. Our heart does not see division, only unity (Figs 24 and 25). There's something else, too. Our hearts love to laugh. Mark Twain's quote that says 'The human race has one really effective weapon, and that is laughter' is really a reference to the heart which loves to laugh with the joy of knowing the true nature of infinite reality and that all the madness of human society is an illusion of the mind. Twain also said: 'Against the assault of laughter nothing can stand.' This is so true of Wetiko and the Cult. Their insecurity demands that they be taken seriously and their power and authority acknowledged and feared. We should do nothing of the sort. We should not get aggressive or fearful which their insecurity so desires. We should laugh in their face. Even in their no-face as police come over in their face-nappies and expect to be taken seriously. They don't take themselves seriously looking like that so why should we? Laugh in the face of intimidation. Laugh in the face of tyranny. You will see by its reaction that you have pressed all of its buttons. Wetiko does not know what to do in the face of laughter or when its targets refuse to concede their joy to fear. We have seen many examples during the 'Covid' hoax when people have expressed their energetic power and the string puppets of Wetiko retreat with their tail limp between their knees. Laugh – the world is bloody mad after all and if it's a choice between laughter and tears I know which way I'm going.

Figure 24: Head consciousness without the heart sees division and everything apart from everything else.

Figure 25: Heart consciousness sees everything as One.

'Vaccines' and the soul

The foundation of Wetiko/Archon control of humans is the separation of incarnate five-sense mind from the infinite 'I' and closing the heart chakra where the True 'I' lives during a human life. The goal has been to achieve complete separation in both cases. I was interested therefore to read an account by a French energetic healer of what she said she experienced with a patient who had been given the 'Covid' vaccine. Genuine energy healers can sense information and consciousness fields at different levels of being which are referred to as 'subtle bodies'. She described treating the patient who later returned after having, without the healer's knowledge, two doses of the 'Covid vaccine'. The healer said:

I noticed immediately the change, very heavy energy emanating from [the] subtle bodies. The scariest thing was when I was working on the heart chakra, I connected with her soul: it was detached from the physical body, it had no contact and it was, as if it was floating in a state of total confusion: a damage to the consciousness that loses contact with the physical body, i.e. with our biological machine, there is no longer any communication between them.

I continued the treatment by sending light to the heart chakra, the soul of the person, but it seemed that the soul could no longer receive any light, frequency or energy. It was a very powerful experience for me. Then I understood that this substance is indeed used to detach consciousness so that this consciousness can no longer interact through this body that it possesses in life, where there is no longer any contact, no frequency, no light, no more energetic balance or mind.

This would create a human that is rudderless and at the extreme almost zombie-like operating with a fractional state of consciousness at the mercy of Wetiko. I was especially intrigued by what the healer said in the light of the prediction by the highly-informed Rudolf Steiner more than a hundred years ago. He said:

In the future, we will eliminate the soul with medicine. Under the pretext of a 'healthy point of view', there will be a vaccine by which the human body will be treated as soon as possible directly at birth, so that the human being cannot develop the thought of the existence of soul and Spirit. To materialistic doctors will be entrusted the task of removing the soul of humanity.

As today, people are vaccinated against this disease or that disease, so in the future, children will be vaccinated with a substance that can be produced precisely in such a way that people, thanks to this vaccination, will be immune to being subjected to the 'madness' of spiritual life. He would be extremely smart, but he would not develop a conscience, and that is the true goal of some materialistic circles.

Steiner said the vaccine would detach the physical body from the etheric body (subtle bodies) and 'once the etheric body is detached the relationship between the universe and the etheric body would become extremely unstable, and man would become an automaton'. He said 'the physical body of man must be polished on this Earth by spiritual will – so the vaccine becomes a kind of arymanique (Wetiko) force' and 'man can no longer get rid of a given materialistic feeling'. Humans would then, he said, become 'materialistic of constitution and can no longer rise to the spiritual'. I have been writing for years about DNA being a receiver-transmitter of information that connects us to other levels of reality and these 'vaccines' changing DNA can be likened to changing an antenna and what it can transmit and receive. Such a disconnection would clearly lead to changes in personality and perception. Steiner further predicted the arrival of AI. Big Pharma 'Covid vaccine' makers, expressions of Wetiko, are testing their DNA-manipulating evil on children as I write with a view to giving the 'vaccine' to babies. If it's a soul-body disconnector – and I say that it is or can be – every child would be disconnected from 'soul' at birth and the 'vaccine' would create a closed system in which spiritual guidance from the greater self would play no part. This has been the ambition of Wetiko all

along. A Pentagon video from 2005 was leaked of a presentation explaining the development of vaccines to change behaviour by their effect on the brain. Those that believe this is not happening with the 'Covid' genetically-modifying procedure masquerading as a 'vaccine' should make an urgent appointment with Naivety Anonymous. Klaus Schwab wrote in 2018:

> Neurotechnologies enable us to better influence consciousness and thought and to understand many activities of the brain. They include decoding what we are thinking in fine levels of detail through new chemicals and interventions that can influence our brains to correct for errors or enhance functionality.

The plan is clear and only the heart can stop it. With every heart that opens, every mind that awakens, Wetiko is weakened. Heart and love are far more powerful than head and hate and so nothing like a majority is needed to turn this around.

Beyond the Phantom

Our heart is the prime target of Wetiko and so it must be the answer to Wetiko. We *are* our heart which is part of one heart, the infinite heart. Our heart is where the true self lives in a human life behind firewalls of five-sense illusion when an imposter takes its place – *Phantom Self*; but our heart waits patiently to be set free any time we choose to see beyond the Phantom, beyond Wetiko. A Wetikoed Phantom Self can wreak mass death and destruction while the love of forever is locked away in its heart. The time is here to unleash its power and let it sweep away the fear and despair that is Wetiko. Heart consciousness does not seek manipulated, censored, advantage for its belief or religion, its activism and desires. As an expression of the One it treats all as One with the same rights to freedom and opinion. Our heart demands fairness for itself no more than for others. From this unity of heart we can come together in mutual support and transform this Wetikoed world into what reality is meant to be – a place of love, joy, happiness, fairness, justice and freedom. Wetiko has another agenda and that's why the world is as

it is, but enough of this nonsense. Wetiko can't stay where hearts are open and it works so hard to keep them closed. Fear is its currency and its food source and love in its true sense has no fear. Why would love have fear when it knows it is *All That Is, Has Been, And Ever Can Be* on an eternal exploration of all possibility? Love in this true sense is not the physical attraction that passes for love. This can be an expression of it, yes, but Infinite Love, a love without condition, goes far deeper to the core of all being. It *is* the core of all being. Infinite realty was born from love beyond the illusions of the simulation. Love infinitely expressed is the knowing that all is One and the swiftly-passing experience of separation is a temporary hallucination. You cannot disconnect from Oneness; you can only *perceive* that you have and withdraw from its influence. This is the most important of all perception trickery by the mind parasite that is Wetiko and the foundation of all its potential for manipulation.

If we open our hearts, open the sluice gates of the mind, and redefine self-identity amazing things start to happen. Consciousness expands or contracts in accordance with self-identity. When true self is recognised as infinite awareness and label self – Phantom Self – is seen as only a series of brief experiences life is transformed. Consciousness expands to the extent that self-identity expands and everything changes. You see unity, not division, the picture, not the pixels. From this we can play the long game. No more is an experience something in and of itself, but a fleeting moment in the eternity of forever. Suddenly people in uniform and dark suits are no longer intimidating. Doing what your heart knows to be right is no longer intimidating and consequences for those actions take on the same nature of a brief experience that passes in the blink of an infinite eye. Intimidation is all in the mind. Beyond the mind there is no intimidation.

An open heart does not consider consequences for what it knows to be right. To do so would be to consider not doing what it knows to be right and for a heart in its power that is never an option. The Renegade Mind is really the Renegade Heart. Consideration of consequences will always provide a getaway car for the mind and

the heart doesn't want one. What is right in the light of what we face today is to stop cooperating with Wetiko in all its forms and to do it without fear or compromise. You cannot compromise with tyranny when tyranny always demands more until it has everything. Life is your perception and you are your destiny. Change your perception and you change your life. Change collective perception and we change the world.

Come on people … One human family, One heart, One goal … *FREEEEEEDOM*!

We must settle for nothing less.

Postscript

The big scare story as the book goes to press is the 'Indian' variant and the world is being deluged with propaganda about the 'Covid catastrophe' in India which mirrors in its lies and misrepresentations what happened in Italy before the first lockdown in 2020.

The *New York Post* published a picture of someone who had 'collapsed in the street from Covid' in India in April, 2021, which was actually taken during a gas leak in May, 2020. Same old, same old. Media articles in mid-February were asking why India had been so untouched by 'Covid' and then as their vaccine rollout gathered pace the alleged 'cases' began to rapidly increase. Indian 'Covid vaccine' maker Bharat Biotech was funded into existence by the Bill and Melinda Gates Foundation (the pair announced their divorce in May, 2021, which is a pity because they so deserve each other). The Indian 'Covid crisis' was ramped up by the media to terrify the world and prepare people for submission to still more restrictions. The scam that worked the first time was being repeated only with far more people seeing through the deceit. Davidicke.com and Ickonic.com have sought to tell the true story of what is happening by talking to people living through the Indian nightmare which has nothing to do with 'Covid'. We posted a letter from 'Alisha' in Pune who told a very different story to government and media mendacity. She said scenes of dying people and overwhelmed hospitals were designed to hide what was really happening – genocide and starvation. Alisha said that millions had already died of starvation during the ongoing lockdowns while government and media were lying and making it look like the 'virus':

Restaurants, shops, gyms, theatres, basically everything is shut. The cities are ghost towns. Even so-called 'essential' businesses are only open till 11am in the morning. You basically have just an hour to buy food and then your time is up.

Inter-state travel and even inter-district travel is banned. The cops wait at all major crossroads to question why you are traveling outdoors or to fine you if you are not wearing a mask.
